

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

year book*

THE NEW INTERNATIONAL YEAR BOOK

A COMPENDIUM OF THE WORLD'S
PROGRESS

FOR THE YEAR

1908

DODD, MEAD AND COMPANY**

PREFACE

The YEAR BOOK FOR 1908 is the second in the new series of annual volumes beginning with 1907. The old series ceased with the publication of the INTERNATIONAL YEAR BOOK for 1902, and as the series of *Appleton's Annuals* terminated at the same time, there remained no summaries of the year's history in this country save such as were afforded by newspaper almanacs or annuals on special subjects, necessarily of very limited scope. In response to constant demands for a comprehensive treatment of the year's events, the publication was resumed and the NEW INTERNATIONAL YEAR BOOK for 1907 was issued last year, comprising in addition to the record of the year, brief summaries of the events which had occurred in the interval.

The present volume differs materially in scope and plan from other annual summaries published in English. In the first place, it is designed as a cyclopædia of the year, including such subjects as have in the course of the year been marked by change or progress. It is a record not only of events and statistics but of current discussion. Its political articles recapitulate important debates as in the account of the PRESIDENTIAL CAMPAIGN; its articles on the sciences and arts present the pros and cons on disputed points. Over forty special contributors supply accounts of the year's changes in their respective fields; for example, Dr. A. C. True and Dr. E. W. Allen, of the U. S. Department of Agriculture, in AGRICULTURE and HORTICULTURE; Dr. Clark Wissler, of the American Museum of Natural History, in ANTHROPOLOGY; Professor O. S. Tonks, of Princeton University, in ARCHÆOLOGY; Professor T. W. Edmondson, of the New York University, in ASTRONOMY and METEOROLOGY; Professor M. A. Rosanoff, of Clark University, in CHEMISTRY; Dr. A. W. Ferris, President of the New York Commission in Lunacy, in MEDICINE; Professor Alfred Remy, in MUSIC; Professor A. D. F. Hamlin, of Columbia University, in ARCHITECTURE; Mr. M. N. Baker, of the *Engineering News*, in SANITARY ENGINEERING and MUNICIPAL GOVERNMENT; Professor A. L. Treadwell, of Vassar College, in ZOOLOGY; Professor Charles Knapp of Barnard College, and Dr. Louis H. Gray in PHILOLOGY; Mr. C. C. Adams in EXPLORATION and POLAR RESEARCH. In these and other departments assigned to members of the staff the subjects are arranged alphabetically under such titles as would naturally occur to the reader. Thus, ASTRONOMY, METEOROLOGY, ANTHROPOLOGY, ARCHÆOLOGY, PHILOLOGY, MUSIC, DRAMA, PAINTINGS, SCULPTURE, LITERATURE (ENGLISH AND AMERICAN), FRENCH LITERATURE, GERMAN LITERATURE, PSYCHOLOGY, CHEMISTRY, PHYSICS, GEOLOGY are discussed under these titles and not distributed among subordinate and less familiar headings. On the other hand, Medicine, Civil Engineering, Mechanical Engineering, Electrical Engineering, Manufactures, Economics, Social Science, Sports are treated under individual titles such as PLAGUE, INSANITY, CANCER, TUBERCULOSIS, BRIDGES, CANALS, DAMS, TUNNELS, CONCRETE, ELECTRIC LIGHTING, ELECTRIC RAILWAYS, IRON AND STEEL, BANKS AND BANKING, FINANCIAL REVIEW, CHILD LABOR, FOOTBALL, BASEBALL, etc.

In the second place the YEAR BOOK reduces to a minimum the class of information that can be found in any general work of reference, retaining only so much as is necessary for a brief explanation of the subject and thus gaining space for a more ample discussion of matters appropriate to the year. It is not a revision of a preceding volume, but a newly written work. The use of "standing matter" from year to year, including detailed descriptions of forms of government, long tables of retrospective statistics, and identical narratives of well known events, has seemed to the editors an unwarrantable waste of space and a serious detriment to an annual volume. That policy was not followed in the old series of Year Books and will not be followed in the new.

The need of a reference book framed on the present plan is perhaps too obvious to require explanation. It is a need supplied in other countries by annual volumes of similar character but narrower scope. In England, for example, the *British Annual Register* records political events and the *Statesman's Year Book* supplies statistics. Without such means of reference it is more difficult to secure information concerning recent events than concerning matters comparatively remote, for the immediate antecedents of current happenings are buried in the files of the periodicals. Readers of newspapers and writers on current topics need a reference book to the immediate past, a single and convenient source for a class of information that is widely scattered and difficult of access. Such a volume, if rightly prepared, will dovetail closely with current events. But though confident in the merits of the plan, the editors will, as was said in the preface to the 1907 volume, welcome any suggestion as to improvement in its execution.

The eventful year 1908 presented some difficult problems of selection. As the year of the Presidential elections it required unusually extended discussions under the UNITED STATES and PRESIDENTIAL CAMPAIGN. As the year following the panic the FINANCIAL REVIEW, and the articles on BANKS, CURRENCY, LOAN AND TRUST COMPANIES, RAILWAYS, and the various industries assumed especial importance. The prominence of Labor questions demanded the discussion at length of such topics as BOYCOTT, INJUNCTIONS, STRIKES AND LOCKOUTS, ARBITRATION, TRADE UNIONS. State politics and legislation were of unusual interest and required proportionate treatment in the paragraphs on Politics and Government in the articles on States. Noteworthy progress was made in many movements for reform, including such divergent

fields as CHILD LABOR, the DIRECT PRIMARY, INTERNATIONAL ARBITRATION, PROHIBITION, WOMAN'S SUFFRAGE, CONSERVATION OF NATIONAL RESOURCES, JUVENILE COURTS, JUVENILE DELINQUENTS, and PENOLOGY. The foreign record was equally crowded. Early in the year occurred the assassination of King CARLOS and the Crown Prince of PORTUGAL, and at its close ITALY was visited by the most disastrous of EARTHQUAKES; TURKEY after the successful struggle of the Young Turk party began her experiment with a constitution; PERSIA experienced a *coup d'état* and an insurrection and failed to restore her short-lived parliament; CHINA, by the Emperor's decree, secured the promise of a constitution; AUSTRIA-HUNGARY's annexation of Bosnia and Herzegovina, followed by BULGARIA's Declaration of Independence, brought the BALKAN QUESTION to a crisis, of which war seemed for a time the probable outcome; FRANCE had a war on her hands in Morocco and became involved with Germany in diplomatic disputes; RUSSIA at last found a Duma that it was not necessary to disperse and presented an interesting simulacrum of parliamentary government; GERMANY saw the defeat of the electoral reform movement in Prussia, the passage of the Polish Expropriation law and the Association law and the extraordinary discussion arising from the publication of the Kaiser's interview in an English newspaper; the Baltic and North Sea agreements guaranteed the status of the Scandinavian countries on those seas; GREAT BRITAIN had an interesting but unfruitful parliamentary history, remarkable for the heated discussion of measures that did not pass; CANADA had her general elections; BRITISH SOUTH AFRICA took the first formal step toward union in a convention of representatives from the component states at Durban; INDIA passed a turbulent year of bomb throwing, anarchistic plots and sedition in the press.

In pure and applied science the advances made during the year have been no less striking than in politics. In AERONAUTICS the successful tests of the Wright Brothers' aeroplanes in the United States and France indicated the solution of the problem of aerial navigation with machines heavier than air. In preventive medicine, study of the PLAGUE, especially as it has affected certain parts of the United States where it has threatened to gain a foothold, is a work of importance. FIRE PROTECTION for great cities was being secured by the provision of high pressure water supply systems, while in SHIPBUILDING the combination of the STEAM TURBINE and the reciprocating engine was making for increased economy. In PHYSICS progress was made with the elaboration of modern theories of matter and electricity, aided by recent researches with radio-active substances. The scientific study of EARTHQUAKES was made doubly interesting by the disaster in Italy and Sicily, while in ASTRONOMY, Professor Hale's striking researches on the nature of the sun spots made at the Mount Wilson Observatory of the Carnegie Institution have widely increased this field of knowledge for the astronomer and physicist. In the EMMANUEL MOVEMENT, religion, medicine and psychology have united for the relief of human ills and this interesting form of psychotherapy is worthy of discussion in all its branches. In MINERALOGY much was accomplished during the year and the discovery of an American DIAMOND field in Arkansas was matched in interest by the cutting of the Cullinan diamond, the world's most valuable stone. In NAVAL PROGRESS the attention of the world has been directed to BATTLESHIPS and the *Dreadnought* became during the year a measure of value in estimating the strength of the existing and proposed navies for the great powers. MILITARY PROGRESS involved partial re-armaments and the development of new forms of manœuvres. In ARCHITECTURE progress in design was accompanied by such forms of practical construction as the skyscraper, rising to new heights, and this in turn was only made possible by the improved and more efficient forms of ELEVATORS. Activity in scientific AGRICULTURE so benefited the condition of the farmer that, despite a year of general depression, agricultural industries were maintained in fairly good condition, while the scientific campaign in HORTICULTURE, STOCK RAISING, VETERINARY SCIENCE was pushed forward unceasingly. The year in ZOOLOGY was marked by the Darwin Centenary and by much scientific progress. Economic ENTOMOLOGY and the part played by INSECTS IN THE PROPAGATION OF DISEASE came in for no less attention in 1908 than in previous years.

The statistical articles are derived from official sources. In the preparation of these and other articles dealing with public affairs, especially in the United States and Canada, invaluable aid has been given by government officials. Especial recognition is due Major Frank McIntyre, Acting Chief of the Bureau of Insular Affairs, for information in regard to the Philippines and other possessions of the United States; to Mr. O. P. Austin, Chief of the Bureau of Statistics, Department of Commerce and Labor, and Mr. Victor Olmstead, Statistician of the Department of Agriculture; various officials in the Departments of War, Navy, and the Interior; the Superintendents of Education, Commissioners of Charities and Corrections, Treasurers, and Commissioners of Labor and Statistics in the several States; the officers of colleges, societies and religious bodies; and to the editors of leading newspapers in the States who have coöperated in the preparation of the paragraphs on State politics and history.

NOTE: Cross references in SMALL CAPITALS indicate that the allusion is to a separate article; cross references in *italics* denote that the reference is to a subdivision of a main article. A cross reference in *italics*, standing alone in an article, carries the reference to another subdivision of the same article. The letters q. v. (*quod vide*=Latin "which see") in parenthesis, following a word, indicate that the subject is treated under its own name elsewhere in the volume.

THE NEW INTERNATIONAL YEAR BOOK

ABBOTT, EDWARD. An American clergyman and author, died on April 5, 1908. He was born in Farmington, Maine, on July 15, 1841, graduated at the University of the City of New York in 1860, and studied at Andover Theological Seminary. In 1863, after serving at Washington in the United States Sanitary Commission, he was ordained to the Congregational ministry. He was pastor of Pilgrim Church, Cambridge, Mass., from 1865 to 1869, when he became associate editor of the *Congregationalist*. He resigned this post in 1878 to accept the editorship of the *Literary World*, a position which he held until 1888. In 1879 he was ordained to the Protestant Episcopal priesthood, and accepted the rectorship of St. James Church, Cambridge, where he remained until his death. He wrote several books, chiefly religious and historical. Among these are: *Conversations of Jesus* (1875); *Paragraph History of the United States* (1875); *Paragraph History of the American Revolution* (1876); and *Phillips Brooks* (1900).

ABD-EL-AZIZ. See MOROCCO.

ABDUL HAMID II. SULTAN OF TURKEY. See TURKEY.

ABYSSINIA. An independent country in East Africa. Area, about 308,000 square miles; population, 8,000,000. Addis Abeba, the capital, has 30,000 inhabitants; Harrar, 40,000; Gondar, 5000; Aksum, 5000; Diré Dawa, founded in 1902, 4500. Several European houses have been erected at Addis Abeba with the aid of a German architect. The Empress has caused the erection of a modern hotel, which was inaugurated in the presence of the diplomatic representatives. Sericulture has been started. Cotton culture on a large scale has been introduced by Europeans with pronounced success. A saw-mill has been established at Addis Abeba. Greek artisans are engaged in quarrying and stone hewing. The imports are mainly cotton goods, largely American; woolens, silks, cutlery, matches, and mirrors; the exports are mainly civet, coffee, gum, wax, hides, gold, and ivory. In 1906 the imports through Eritrea amounted to 8,688,000 francs, and through French Somaliland, 13,977,000 francs; the exports through

Eritrea were valued at 5,748,000 francs, and through French Somaliland 8,875,000 francs (1 franc equals 19.3 cents), besides the trade through British Somaliland, British East Africa, and the Anglo-Egyptian Sudan. The principal trading centres are Harrar, Ankober, and Addis Abeba. At Harrar there are half a dozen large warehouses containing a great diversity of goods. The railway from Diré Dawa to Jibuti, in French Somaliland, is 193 miles long. In September, 1908, it was reported that the Government of Abyssinia approved the plans for the projected railway from Diré Dawa via Harrar, to Addis Abeba, and that a contract had been signed with a French company. The distance from Addis Abeba to Jibuti is 528 miles. The Bank of Abyssinia, established with a capital of £500,000 by the National Bank of Egypt, has the privilege of minting the Abyssinian coinage, issuing legal tender notes, and engaging in all industrial, commercial, and financial enterprises.

The government is feudal in character. Each of the large provinces is under a *Ras*, or feudal chief, under whom are the governors of districts and chiefs of villages. The more important of the *rasas* constitute the Council of State. The King in 1908 was Menelek II. A regular army of about 150,000 men which was supplemented by irregular and territorial forces was maintained. The entire army was supposed to be mounted, and was armed with Gras and magazine rifles. There were seven batteries of field guns and mitrailleuses. A convention with Italy was signed in May, defining the limits of Italian Somaliland. (See below.) In the latter part of 1907, Mount Afdera, within 200 miles of the Gulf of Aden, supposed to have become extinct ages ago, suddenly burst into tremendous volcanic activity, which was accompanied by violent shocks of earthquake. The vegetation of an area over 150 square miles in extent was blotted out. The herders living in the neighborhood of the mountain were compelled to flee, one tribe losing 200 members from fright and exhaustion. The survivors took refuge on the high plain of Biru and said they would never again live near the mountain.

HISTORY. The agreement of July 6, 1906, on the part of Great Britain, France, and Italy had guaranteed the *status quo* in Abyssinia and the

maintenance of the policy of the open door, and the three powers had further engaged mutually to protect their interests in the adjoining regions, Great Britain and Egypt in the Nile Basin, Italy in Benadir, Eritrea and Somaliland and France in the Somali Protectorate and hinterland, and the regions traversed by the projected railway from Addis Abeba to Jibuti. Early in January, 1908, it was reported that in the month of December the Abyssinians had raided certain regions in the Benadir hinterland, plundering villages and slaying the inhabitants. The natives applied to the Italian Resident at Lugh for aid, and some fighting followed between the Italians and the friendly natives on the one hand and the raiders on the other, resulting in considerable losses and the killing of two Italian officers. Italy at once protested at Addis Abeba against the violation of her territory. In response to the Italian demands Menelek gave assurances of his friendliness and ordered the raiders to withdraw. In March it was learned that the chiefs involved in the raid had been condemned to imprisonment, and that Menelek had promised to appoint new chiefs on the Benadir border. On May 16, Menelek and the Italian Representative at Addis Abeba signed a convention fixing the boundaries between Italian Somaliland and Abyssinia; and Italy, in return for the payment of \$600,000, was guaranteed the possession of Lugh and of the caravan centre at the meeting of the Dau and Ganana rivers. (See ERITREA and ITALIAN SOMALILAND.) In June Menelek appointed as his successor to Lidj Eyassu, a son of Ras Michael and the King's daughter; he was born in 1896. In August, 1908, it was reported that the policy of forming a cabinet on the European model, which King Menelek had announced in October, 1907, had been carried into effect, a more efficient and suitable system being substituted for the half patriarchal court. In 1908 Abyssinia became a member of the Postal Union. The Ethiopian Railway Company, which is engaged in the construction of the railroad from Jibuti to Addis Abeba, and which, after carrying the line from the coast to Diré Dawa, had been brought to a standstill by financial difficulties, entered upon a new reorganization late in 1908, involving substantial aid by the French government.

ACADÉMIE FRANÇAISE, founded by Cardinal Richelieu in 1635 and reorganized in 1810, is the first in order and the most eminent of the five academies which constitute the Institute of France. It is the chief tribunal in all questions relating to the niceties of the French language, and to grammar, rhetoric, poetry, and the publication of the French classics. The membership is limited to forty, known as the "Forty Immortals," who are elected for life. The members receive an annual stipend of 1500 francs and, in addition, the six members of the dictionary committee receive each 1000 francs annually. The Académie annually distributes 12,000 francs in prizes alternately for poetry and eloquence, besides a number of smaller prizes. Three new members were elected in 1908. Jules Henri Poincaré succeeded Prudhomme, Jean Richepin succeeded Theuriet, and Frances Charmes succeeded Berthelot. The chairs left vacant at the deaths of Boissier, Sardou, Coppée, Halévy, Mathieu, and Prévost had not been filled up to the end of the year. The present academicians and dates of their elections

are: Emile Ollivier, 1870; Alfred Jean François Mézières, 1874; Othénin P. de Cléron Comte d'Haussonville, 1886; Jules Arnaud Arsène Claretie, 1888; Eugène Marie Melchior Vicomte de Vogué, 1888; Charles Louis de Saules de Freycinet, 1890; Louis Marie Julien Viaud (Pierre Loti), 1891; Ernest Lavisse, 1892; Paul Louis Thureau-Dangin, 1893; Paul Bourget, 1894; Henri Houssaye, 1894; Jules Lemaitre, 1895; Jacques Anatole Thibault (Anatole France), 1896; Marquis Marie C. A. Costa de Beauregard, 1896; Louis Jules Albert Comte Vandal, 1896; Albert Comte de Mun, 1897; Gabriel Hanotaux, 1897; Henri Léon Emile Lavedan, 1899; Paul Deschanel, 1899; Paul Hervieu, 1900; Auguste Emile Faguet, 1900; Charles Jean Melchior, Marquis de Vogué, 1901; Edmond Rostand, 1901; Frédéric Masson, 1903; René Bazin, 1903; Etienne Lamy, 1905; Alexandre Felix Joseph Ribot, 1906; Maurice Barrès, 1906; Marquis de Ségur, 1907; Maurice Donnay, 1907; Maître André Barboux, 1907; Jules Henri Poincaré, 1908; Jean Richepin, 1908; Frances Charmes, 1908.

ADEN. A peninsula and town near the southwest corner of Arabia, a British colony. Area, 75 square miles; population in 1901, 41,222 (28,180 males and 13,042 females). Attached to Aden are the island of Perim, at the entrance to the Red Sea, 5 square miles and 2752 inhabitants in 1901; the island of Sokotra, off the coast of Africa, 1382 square miles and about 12,000 inhabitants; the five Kuria Muria Islands off the south coast of Arabia, ceded by the Sultan of Oman for the purpose of landing the Red Sea cable; and the Aden Protectorate, comprising about 9000 square miles of the Arabian hinterland, with a population of about 100,000. The importance of Aden lies solely in its position. It is an important coaling-station on the Suez route, and is strongly fortified. The trade is almost entirely transit. The chief imports are cotton goods, grain and flour, petroleum, hides and skins, and tobacco. The chief exports and coffee, gums, civet, ivory, wax, and the articles mentioned under imports. In 1907 8 the sea-borne imports amounted to Rs. 44,669,050 (Rs. 5,335,892 in treasure), and the sea-borne exports, Rs. 40,471,126 (Rs. 5,267,703 in treasure). (1 rupee = 32.44 cents.) American cotton goods and kerosene oil are largely imported. The imports from the interior of Arabia by land in 1907-8 amounted to Rs. 2,475,007 of merchandise and Rs. 123,387 of treasure; the exports to the interior were Rs. 1,497,086 of merchandise and Rs. 155,406 of treasure. The Protectorate and its dependencies are attached to British India, forming a part of the Bombay Presidency. The administration is in the hands of a Political Resident—in 1908, Major-General E. De Brath.

ADLER, FRIEDRICH. A German architect and writer on architectural subjects, died in Berlin on September 15, 1908. He was born in Berlin, on October 15, 1827, and studied architecture, at the Berlin Academy, under Strack. He was appointed professor there in 1863, and in 1877 was made consulting architect to the Prussian Ministry of Public Works. He was an authority on ancient and mediæval archi-

ture, and was actively interested in the excavations at Olympia. Among his publications are: *A History of the Architecture of Berlin* (1861); *The Architecture of Some of the World's Historic Cities* (1872); and *Architectural Investigations in Germany* (1870-79).

ADULTERATION. See FOOD AND NUTRITION.

ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION OF. A learned society, chartered in 1874, being a continuation of the American Association of Geologists and Naturalists, organized in 1840. The membership is about 6,000. The Association is made up of eleven sections as follows: Mathematics and Astronomy, Physics, Chemistry, Mechanical Science and Engineering, Geology and Geography, Zoology, Botany, Anthropology and Psychology, Social and Economical Science, Physiology and Experimental Medicine, and Education. The annual meeting of the Association is held each year in a different city. The meeting of 1908 was held in Baltimore on December 28. It was the largest meeting of the society yet held, and surpassed in size and importance any gathering of scientific men ever seen in this country or probably elsewhere. The attendance at the meeting is estimated to have been in excess of 2500. Over 300 papers were read in all the sections. Many public lectures of interest were delivered. Among them were the following: "Mimicry in the Butterflies of North America," by Professor Poulton of Oxford; "Man, Climate and Soil," by Professor Penck of Berlin; "The Problem of Beauty," by Professor Münsterberg of Harvard; "A Visit to Mt. Kilauea," by Mr. Bryan of Honolulu; "Recent Progress in Aeronautics," by Major Squier of the United States Army; "Earthquake Forecast," by Mr. G. K. Gilbert of the United States Geological Survey. There were on the programme published by the Association the titles of more than 1000 papers to be read at the meeting, of which the great majority represented research work of the highest order. While the papers were, in the main, special and technical in character, there were in each science papers containing results of interest to a wide group of scientific men and in many cases to the public. Among the most notable was a series of addresses before the American Chemical Society, and a symposium on correlation in which sixteen leading geologists took part. There were general discussions arranged also by the botanists, and symposia on college education and life, on physical instruction in schools and colleges, and on public health. The most notable feature of the meeting was the celebration of the Darwin Centenary in which Professor E. B. Poulton came from England to take part. Among the most notable addresses delivered was that of the retired chairman of the section on Chemistry, Henry P. Talbot of the Massachusetts Institute of Technology, on "Science Teaching as a Career." A notable address was delivered on recent researches on the "Determination and Heredity of Sex," by Professor Edmund B. Wilson of Columbia University, vice-president, and chairman of the section on Geology. The next meeting of the Association will be held in Boston, under the presidency of Dr. David Starr Jordan, President of Leland Stanford Jr. University. The vice-presidents for the sections are as follows: Mathematics and Astronomy, Professor Ernest W. Brown of Yale University; Physics, Dr. L. A. Bauer,

Carnegie Institution, Washington, D. C.; Chemistry, Professor Wm. McPherson, Ohio State University; Mechanical Science and Engineering, Dr. J. F. Hayford, U. S. Coast and Geodetic Survey; Geology and Geography, Dr. R. W. Brock, Director of the Canadian Geological Survey; Zoology, Professor William E. Ritter, University of California; Botany, Professor D. T. Penhallow, McGill University; Anthropology and Psychology, Dr. William H. Holmes, Bureau of American Ethnology; Social and Economic Science, President Carroll D. Wright, Clark College; Physiology and Experimental Medicine, Professor Charles S. Minot, Harvard Medical School; Education, Professor J. E. Russell, Dean of Teachers College, Columbia University; Anthropology, Professor George Green McCurdy, Yale University (Secretary). The General Secretary is Professor Dayton C. Miller, of the Case School of Applied Science.

ADVENTISTS. Several bodies of Adventists have practically nothing in common with the Seventh Day Adventists, except possibly the doctrine of the second coming of Christ, and the connection even there is very remote. These bodies are the Evangelical or Advent Christians, the Church of God, the Liberal Advent Union, and Churches of God in Jesus Christ. Next to the Seventh Day Adventists the Advent Christians are the most numerous. They number about 35,000 communicants, 53 conferences, 755 churches, 716 ordained and 167 licensed ministers, and 351 Sunday schools, with an enrollment of 16,545 scholars. The next conference will be held at Mendota, Illinois, in 1909. This denomination publishes four papers: *The World's Crisis*; *Our Hope*; *Present Truth*; and *Messiah's Advocate*. Other branches of the Adventists number about 7,000.

ADVENTISTS, SEVENTH DAY. A religious denomination which was founded originally on the doctrine of the second coming of Christ, which was quite extensively believed in the United States and Europe during the years 1840-44. After the passing of the time set for this in 1844, many of the believers gave up the doctrine, while others, on reviewing the historical prophetic evidences, saw that the mistake was in believing that the "sanctuary to be cleansed was not this earth, but rather that it was the sanctuary in Heaven." Thus, there arose in New England in 1846 a small body who, while believing in the second coming of Christ, have never set a time for that event, but hold to the Scripture statement that it is "near, even at the door," and also observe the seventh day of the week as the Sabbath. At the close of 1908 the Seventh Day Adventist denomination, whose headquarters are at Washington, D. C., had 21 union conferences, 98 local conferences, 127 foreign mission stations, 33 being in non-Christian lands, and over 2600 churches in eighty of the principal countries of the world, with about 100,000 communicants. For the spread of the evangelistic work there was contributed by the denomination during 1908, approximately \$2,000,000. In institutional lines the work is represented by 31 colleges and academies, and about 500 primary and intermediate schools. There are 25 denominational publishing houses, which print 115 papers. The denomination also operates over seventy sanitariums with which there are connected over 1500 physicians and trained employees. The next

general conference of the denomination meets at Washington in May, 1909.

AERONAUTICS. The most important aspect of the progress of aerial navigation during the year 1908 was the demonstrated triumph of the aeroplane. Just as the dirigible balloon had been shown in previous years to be a practical possibility and needing only development and improvement at the hands of military men and others working at its construction and actual use, so during 1908 the ability of the aeroplane to maintain sustained flight at high speed and to be controlled by its operator was proved. But it must not be understood that either the aeroplane or the dirigible balloon was to be considered a realized achievement for every day use; merely that both had passed from the experimental into the practical stage. Particularly was this the case with the Wright brothers' aeroplane, which after more than five years of experiment and development, carried on, too, with such secrecy as to provoke much scepticism especially in Europe, was shown to the world to be a practical heavier-than-air machine capable of carrying passengers, and in large measure solving the problem of artificial flight. Such work as this, as well as the inventions of others, by no means to be despised, naturally increased not only general interest in aeronautics but that of various governments alive to the military possibilities of the navigation of the air. As a result in 1908 more than ever the practical test of airships and aeroplanes was being carried on in a practical and effective manner. The interest was keenest in France, where not only the Government but private associations and individuals stood ready to encourage all forms of aeronautics and the most important trials were made of new inventions. Thus there were various competitions for substantial prizes where the conditions previously announced were believed to be such as to put before the different inventors a reasonably high standard, and several mechanics of experience and reputation devoted themselves to the commercial construction and development of apparatus for aerial navigation and flight.

AVIATION. The usual and logical division of devices for aerial navigation into those for aviation, or heavier-than-air machines intended for artificial flight, and those for aerostation of lighter-than-air apparatus, such as balloons, will be observed here, and inasmuch as the greatest progress in the year 1908 was witnessed among the aeroplanes which manifestly are included in the first class it is desirable to consider the striking developments witnessed in this field. First and foremost were the successful tests and demonstrations of the Wright brothers' aeroplane at Fort Myer, Va., and at Le Mans, France. At the former place Orville Wright submitted to the United States Army Signal Corps for trial in September an aeroplane built to meet the Government specifications and requirements as announced December 23, 1907, where it was demanded that a heavier-than-air machine be submitted for test in trial flights, capable of carrying one passenger beside the aviator and fuel for 125 miles, and also able to remain in the air without landing for one hour, as well as make a minimum speed of 36 miles an hour against and with the wind over a measured course of more than five miles. The Wright aeroplane submitted for these and other tests by Orville Wright, had

two superposed main surfaces aggregating about 500 square feet, the two planes having a spread of 40 feet and being $6\frac{1}{2}$ feet from front to rear, while they were spaced 6 feet apart. The horizontal rudder, also formed by two superposed planes about 15 feet long and 3 feet wide, was in front of the main surfaces, while the vertical rudder consisting of two surfaces trussed together and about $5\frac{1}{2}$ feet long and 1 foot wide was behind the main planes. A 4-cylinder water-cooled motor developing about 25 horsepower at 1400 revolutions per minute drove two wooden propellers $8\frac{1}{2}$ feet in diameter and working at about 400 revolutions per minute. The entire machine weighed about 800 pounds and was supported on two runners. In starting, it rose from a monorail track. Repeated preliminary tests to accustom the aviator to the manipulation of the machine met with success, and various flights were made, in some of which an estimated maximum speed of 40 miles per hour was made. The length of flight was also increased, and on September 12 a record flight of 1 hour 14 minutes and 20 seconds was made. On each successive occasion better control of the aeroplane was secured, often a passenger was carried and it seemed to be manoeuvred at the will of the aviator. Everything apparently was in readiness for meeting the Government specifications, which at the time of their promulgation, it may be said, were criticised as unduly rigorous and not justified by the state of the art, when during a flight on September 17 one of the propeller blades was broken accidentally and the aeroplane was thrown to the ground and destroyed. The accident involved the death of Lieut. T. E. Selfridge, U. S. A., who was accompanying Mr. Wright as passenger, and the serious injury of the latter. This misfortune temporarily put an end to these trials, as Mr. Wright recovered from his injuries only towards the end of the year.

In France no such accident attended Wilbur Wright's demonstrations, and his brilliant work was acclaimed by European authorities as the successful solution of the problem of mechanical flight. Progressively, he was able to demonstrate his complete control of his machine, his ability to remain in the air as long as he desired, and to carry a passenger aloft in addition to the aviator. Both Wright's aeroplane and his skill in its manipulation and complete knowledge of the conditions involved in its use immediately were appreciated as in advance of the best French work, and this was made the more apparent as time in flight, speed and distance were gradually increased. On September 21, Mr. Wright made a continuous flight of 1 hour and 31 minutes, and in a trial for the Michelin prize of \$4000 and a trophy valued at \$2500, was in the air continuously for 1 hour 53 minutes and 59 seconds, covering a distance of $61\frac{1}{2}$ miles at a speed of 36 miles an hour. The success of the Wright aeroplane, and particularly the fulfilment of specified conditions in a trial on October 10, enabled the brothers to dispose of the French patent rights for \$100,000 to a syndicate headed by M. Lazare-Weiler. This syndicate ordered the construction of 50 Wright aeroplanes and by the end of the year the training of aviators in their use and preparation for their manufacture were under way. The Michelin cup for the greatest distance travelled by an aeroplane before the end of the year 1908

AERONAUTICAL WORK OF THE SIGNAL CORPS, U. S. ARMY, 1908

around a triangular course marked by flags at measured distances was virtually won on December 18, by Wilbur Wright in a flight of over 90 miles, but this record was broken on December 31, when ascending from Le Mans Mr. Wright made a flight lasting 2 hours and 18 minutes 33 seconds, covering a distance officially stated at 123 kilometers 200 meters (76.6 miles), but which on account of wide corners amounted to over 150 kilometers (93.2 miles). Mr. Wright also made an aeroplane record for height when on Dec. 18 he won the Aero Club de la Sarthe 100 meter (328 feet) height prize by soaring in a 9 minute flight to a distance estimated at 360 feet over a line carried by captive balloons without covering more than 800 meters (2625 feet) over the ground.

Second to the work of the Wrights was that of Henri Farman of France whose aeroplanes figured in numerous important experiments and competitions. In fact, during 1907 Farman really made the best public performances and with his aeroplane made flights up to one kilometer (.62 miles) in length. On January 13, 1908 he won the Deutsch-Archdeacon prize for the first heavier-than-air machine flying a kilometer, and by March 20, was able to accomplish a flight of 2734 yards. On July 6, he flew for 20 minutes and won the Armengaud prize of 10,000 francs over M. Bleriot by remaining in the air 20 minutes and 20 seconds, the prize being given for the first aeroplane to remain in the air over 15 minutes. After these demonstrations in France and a few flights for exhibition purposes in the United States marked by limited success, Farman made a sensational cross country flight from Chalons to Rheims, a distance of 26 miles, in 43 minutes. Previously he had accomplished a flight of 44 minutes 32 seconds in competition for the Michelin prize.

The Farman aeroplane like that of Delagrangé and other French aviators was built by MM. Voisin who developed a large shop for this kind of work and greatly advanced the mechanical features of a number of aeroplanes for which they were responsible. The type of aeroplane used by Farman was provided with a tail and a number of vertical surfaces to afford stability in flight and to aid in the control of the machine. The supporting surface, arranged in two planes as in the Wright machine, amounted to 535 square feet and the propelling motor driving a single screw consists of an 8-cylinder engine giving 49 brake horsepower at 1100 revolutions per minute. The machine also had a four wheel chassis in place of the light runners of the Wright aeroplane. At the end of the year Farman had made a number of changes in his aeroplane including the addition of a third plane directly above the upper of the two main planes in order to increase its lifting power. Mention may be made of Delagrangé's aeroplane somewhat resembling that of Farman which starting on March 30, 1907 with a flight of 650 feet was the first demonstrated bi-plane in Europe. Then in 1908 after a flight of nearly four kilometers he worked up to a record of 10 miles 1105 yards made at Milan on June 23, and on September 6, at Issy increased this to 15½ miles.

The next important aeroplane was that of Bleriot, known as a monoplane for its single supporting surface. With one of these the inventor made a notable flight from Toury to

Artenay and back, a distance of 17.38 miles with an average speed of 53.78 miles an hour. But the bi-plane seemed to be the more practical form and M. Bleriot who had experimented with both at the end of the year was working with the bi-plane as the more effective form. Another monoplane was that of Esnault-Pelterie which made some successful flights near Versailles, but was undergoing constant change and improvement. Mr. Cody of the balloon department of the British Army at Farnborough developed an aeroplane during the year which was tested during October and September, but was damaged during a flight on October 16. It was not believed to contain any particularly new or advantageous features.

In the United States, outside of the Wright brothers' work, the most important and successful aeroplane developed during the year was the "June Bug" built by the Aerial Experiment Association, with which Glenn H. Curtiss on July 4, for the first time won the *Scientific American* trophy. The distance recorded was a little over a mile in a straight line and a speed of almost 40 miles an hour was made. The aeroplane had two supporting planes aggregating some 390 square feet and a tail somewhat similar to that of the Farman aeroplane. It was driven by a 25 horsepower air-cooled motor and weighed with the aviator 650 pounds. With the experience of this machine the association developed its fourth aeroplane, the "Silver Dart," a heavier machine where a 40 horsepower water-cooled engine was used and the tail omitted. On December 17 this new aeroplane flew over a mile making a speed of about 40 miles an hour. In the bids for an aeroplane submitted to the Signal Corps in addition to the Wright machine there was one by A. M. Herring which was very compact and small. Although a technical delivery was made to the Government, there was during the year no test of it nor were its details made public. The most striking steps in the development of aviation and the aeroplane are shown in the accompanying table from the *Daily Mail* of London, which paper by the way, on October 5, offered a prize of \$2500 for the first 'cross the Channel aeroplane flight.

In December Mr. James Gordon Bennett presented the Aero Club of France with an international aviation prize consisting of a cup valued at \$2500 for annual competition, and three cash prizes of \$5000 each to be given to the winners in the three first annual competitions. The first competition was to be held in France and the rules were to be changed annually.

HELICOPTERS. Other devices than aeroplanes were attracting the attention of inventors and experimenters in 1908, and while no especially notable results were achieved, yet some mention should be made of the various machines. In France Paul Cornu in a helicopter, that is a machine with lifting propellers, rose one foot from the ground on March 25, 1908, and was still further developing his machine. On July 25, 1908 Breguet in his gyroplane, in which was combined an aeroplane and helicopter rose 13 feet and flew 20 meters (65.6 feet). Helicopters have also aroused interest in the United States, and Luyties, Kimball and Berliner, all had machines or large models under test during the year.

Progress in Five Years in Motor Driven Heavier-than-air Machines for Mechanical Flight.

AEROSTATION. The progress made with balloons in 1908 was steady and general rather than sensational, and was largely at the hands of the balloon corps of the various armies, although ballooning as a sport was making considerable headway and there were doubtless more balloons constructed and in use than ever before. The most notable performance perhaps was the long distance trip of the "Zeppelin IV" which is mentioned below where the most significant work in the various countries is outlined.

In France "La République," having a balloon of 3700 cubic meters and driven by a 65 horsepower motor, was built from designs by M. Juillot, and while it involved improvements it was in many respects similar to the ill-fated "La Patrie," carried away and destroyed in November, 1907. The "La République" which was completed and successfully tested in 1908 was somewhat shorter, being about 200 feet in length with a maximum diameter of 35½ feet and a total lifting capacity of 9000 pounds, of which 2700 pounds was available for passengers, fuel, ballast and instruments. This airship made a 125-mile flight in 6½ hours against an unfavorable wind. The "Ville de Paris," built by M. Deutsch and by him presented to the French Government in 1907, and the old Lebaudy airship were in constant use by the French Army. In August, 1908, the French Government established an aerostatic park at Beauval, near Mieux.

The most important work in Germany was in connection with the military airships in the form of dirigible balloons. The airships of Parseval and Zeppelin had been studied with care by the members of the ballooning corps, whose commander Major Gross designed a new airship in which the best features of both were combined. This was given some successful tests, and on September 11 it travelled from Tegel to Magdeburg and back in 13 hours and

2 minutes. A new Parseval airship also was tested in a long distance trial. The active and intelligent interest shown by the German Army in aeronautics centered about the new military airships Gross II, Parseval II, and the reconstructed Zeppelin III, all named after their designers. They were in constant use and various appliances and improvements were added from time to time. Germany has military airships that are not only portable but are independent of a balloon house and this is considered as adding to their availability. In March it was announced that Germany had decided to establish a military airship station near the French frontier, while naval airship stations were planned for Wilhelmshafen and Kiel.

Of great and sensational interest during 1908 was the trial of the large Zeppelin airship in long distance flights and its eventual destruction. Appreciation of Count Zeppelin's previous work found expression in an appropriation of \$537,500 by the Reichstag for the purchase of two of his airships and of \$100,000 to him in recognition of his previous service to science. Accordingly another huge dirigible was constructed which represented the results of Count Zeppelin's many years of experiment. This airship, 440 feet in length and known as the Zeppelin IV, was fairly entitled to the long distance honors of the year, for on July 2, it made a cross country trip from Friedrichshafen to Luzerne, a distance of 248 miles, within 12 hours and making a maximum speed of 34 miles an hour. On August 4, Count Zeppelin left Friedrichshafen in his airship for a 500 mile 24 hour trip, and after making a landing at Oppenheim, a distance of 260 miles in 9 hours, he returned to Stuttgart and finally landed at Echterdingen to renew his supply of hydrogen. It was here that a severe hurricane caused the airship to break its mooring cables, and this with the explosion of the motor worked the utter destruction of the airship. This misfortune at once aroused Germany and a national fund was speedily subscribed to rebuild the airship and to enable Count Zeppelin to resume his experiments, and particularly to reconstruct his airship No. I. On October 23, this reconstructed airship was manoeuvred with eminent success.

In the British Army a balloon and kite headquarters was maintained at Farnborough and here in 1907 was constructed the "Nulli Secundus" which after a limited period of activity was wrecked in October of that year. An improvement and reconstruction of the wrecked airship took place and on July 24, "Dirigible No. II" made an initial and successful trip. The interest of the British Government in military aeronautics was not as great as that of the continental powers, much to the regret of a number of British scientists and enthusiasts who urged the isolated position of the United Kingdom as rendering it particularly liable to aerial attack in the event of war and that adequate defence against such an emergency should be developed. The Russian War Office, which also had lagged behind in aeronautical work, announced in October that it would immediately put aside \$6,000,000 for the construction of airships and aeroplanes.

The first dirigible balloon to be secured by the United States Army was "Signal Corps Dirigible No. I," built in accordance with speci-

AERONAUTICS

fications issued by the Chief Signal Officer, Jan. 21, 1908, for an airship not over 120 feet in length and capable of making 20 miles an hour. A contract for such an airship was awarded to Captain Thomas S. Baldwin and a delivery was made in the following August. This enabled much to be done in training the officers and men of the United States Army in the practical use of a dirigible balloon, as well as accumulating data for theoretical studies. "Dirigible No. 1" had a gas bag, spindle shaped, 96 feet in length with a maximum diameter of 19½ feet and a volume of 20,000 cubic feet. Within the gas bag was a ballonet for air with a capacity of 2800 cubic feet. The gas bag was made of two layers of Japanese silk between which was a layer of vulcanized rubber. From the gas bag, but in close proximity to it, was suspended the car made of spruce 66 feet long, 2½ feet wide, and 2½ feet high. The propeller was located at the front end and was connected to a 20 horsepower water-cooled gasoline motor of the Curtiss type. It was of built-up spruce, 10 ft. 8 in. in diameter, with a pitch of 11 feet and revolved in normal operation at a speed of 450 revolutions per minute. For steering and maintaining a steady position there was a vertical rudder at the rear to which was attached a horizontal surface, and also a fixed vertical surface, while attached to the car in front was an adjustable horizontal surface which could be controlled by a lever. The airship had a total lifting power of 1350 pounds, 500 pounds of which was available for passengers, ballast and fuel. On its trial trip this airship was able to make a speed of 19.61 miles an hour over a measured course, and was duly accepted by the Government.

In view of the increasing interest in aeronautics the United States Signal Corps provided a large balloon plant at Fort Omaha, Nebraska, where there was erected a steel balloon house, 200 feet in length, 84 feet wide, and 75 feet high, which would be available for military airships of the size of "La République" or the Parseval dirigible. The station included an electrolytic plant for generating hydrogen, capable of supplying 3000 cubic feet per hour and a gasometer in which could be stored gas for emergency use up to 50,000 cubic feet. There was installed a compressor for charging the steel flasks or tubes in which the gas can be transported. These tubes are first tested in a high power hydraulic pump. As the Signal Corps intended to develop wireless telegraphy in connection with its dirigible balloons a 200-foot tower was erected to support the aerial wires.

The matter of airships and aeroplanes figuring in the warfare of the future was an important problem much discussed in 1908. At the Second International Peace Conference held at The Hague in the summer of 1907, there was presented a declaration prohibiting the discharge of projectiles and explosives from balloons reading as follows: "The contracting powers agree to prohibit for a period extending to the close of the Third Peace Conference the discharge of projectiles and explosives from balloons or by other new methods of a similar nature." This declaration was signed by the delegates of the United States alone among those of the first class powers and was ratified Mar. 10, 1908, but such action would seem to indicate that aerial warfare was a very open ques-

tion which promised to become as serious as the use of the submarine mine and torpedo boat.

THE BENNETT CUP. The annual competition for the James Gordon Bennett cup for balloons inaugurated at Paris in 1906 when the event was won by Lieut. Frank P. Lahm, U. S. A., in the Balloon "United States," and repeated at St. Louis in the following year to be won by Oscar Erbslöh with a trip to Asbury Park, N. J. of 873 miles, was not as successful in 1908 on account of the wind. Starting from Berlin on October 11, the 23 balloons in the competition were carried to the north and many descended into the sea. The winner was Colonel Schaeck in the Swiss balloon, "Helvetia," who was in the air for 74 hours, descending in the North Sea near Ersholmen, Norway. The "Helvetia" was towed to land by a fishing vessel and though making the longest distance, 1212 kilometers (753 miles), was protested for first prize, not coming down on land, but the protest was not allowed as the actual descent was on *terra firma*. Second and third places were secured by John Dunville in the British balloon "Banshee" and M. Geerts in the Belgian balloon "Belgica," with records of 425 kilometers (264 miles) and 423 kilometers (262 miles) respectively. The German balloon "Hergesell" descended in the water of the North Sea and Lieutenants Foertsch and Hummel were drowned. It must be remembered that in this competition the balloons are not dirigibles and are carried by the wind, the pilots being concerned in securing the most favorable altitudes and air currents.

On Nov. 18 the longest balloon trip of the year was made by A. B. Lambert, and H. E. Honeywell. Starting from St. Louis and landing near Tiger, Ga., a distance of 461 miles in 18½ hours with three landings en route. A 65,000 cubic foot aerostat was used.

AEROPLANES. See AERONAUTICS.

AFGHANISTAN. An independent country of Central Asia, with an area estimated at 225,000 square miles and a population of 5,000,000. The principal cities are Kabul, the capital, 70,000 inhabitants; Herat, 45,000; Kandahar, 35,000. Coal of inferior quality has been found not far from Kabul. A gold mine near Kandahar is worked by a British company. It was supplied with stamping machinery in 1904, and in 1908 some additional machinery was brought up to complete the equipment. In 1908 a boot factory was started in Kabul, and a wool mill was being erected by a British subject. Electric power has also been established at Kabul. The foreign trade is principally with British India and Bokhara. During the year ending Mar. 31, 1907, the imports from India amounted to Rs. 11,247,558, and exports to India, Rs. 9,704,523 (1 rupee = 32.44 cents). Imports from Asiatic Russia were worth about \$520,000, and exports to it, \$1,600,000. The principal imports are cotton goods, indigo, sugar, and Chinese tea. The principal exports are horses and cattle, grain, fruits, vegetables, spices, tobacco, silk, wool, and hides. Good roads for wheeled traffic have been constructed from the Khyber Pass to Kabul and from the Bolan Pass to Kandahar. The road between Kabul and Kandahar was reported in 1908 to be fairly good for motoring. A British railway parallels the Afghan frontier and has pushed out two spurs towards Afghanistan, one through the Bolan Pass to Chaman, on the

Afghan border, and another to Jamrud, at the mouth of the Khyber Pass, 20 miles from the Afghan border. The Russians have a railway through Merv to Kushk, just inside the Afghan frontier, not far from Herat, and a line parallels the frontier from Merv to Bokhara, Samarkand, and Tashkent, where it connects with the main Russian railway system in Central Asia. Between Chaman and Kushk the distance is under 450 miles.

GOVERNMENT. The Ameer in 1908 was Habibullah Khan, who succeeded his father, Abdur Rahman Khan, October 3, 1901. The political organization is of the feudal type. The country is divided into four provinces, administered by governors: Kabul, Turkistan (with Badakshan), Herat, and Kandahar. Justice is administered by the nobles. Taxes are paid in kind. The Ameer receives from the British-Indian government an annual subvention of 1,800,000 rupees, and his relations with foreign powers have to be regulated through that government. The strength of the army is estimated at between 60,000 and 90,000 men, including 9000 cavalry and 360 guns. Every seventh man is subject to conscription. At Kabul there are gun factories and an arsenal.

HISTORY. In the Anglo-Russian convention of 1907 dealing with the territorial interests of the two powers in Central Asia the British Government declared that it had no intention of changing the political status of the country, and would neither annex nor occupy any portion of it; and the Russian government, that it recognized Afghanistan as outside the sphere of Russian influence, and would conduct all political relations with it through the British Government. This arrangement encountered some criticism, but in practice it served to prevent the jealousies and fears which had arisen between the two Powers in the past. The chief event in 1908 was the participation of bands of Afghans in the Mohmand revolt on the Indian frontier (see INDIA, paragraphs on *history*). Bands of Afghans repeatedly crossed the border and joined the Mohmands in their attacks on the British. Even after the Mohmand uprising had been put down, the Afghan attacks continued. There seemed at first no evidence of any effort on the part of the Ameer to restrain his subjects, and the Indian Government made urgent protests against this violation of Indian territory. By some it was explained as a result of the plots formed against the Ameer by his brother, Prince Nasrullah. The Ameer had lately been absent from his capital, and it was said that his brother wished his downfall, and to that end was endeavoring to get him into difficulties with the Indian Government. To this embarrassment in his home affairs, the Ameer's inaction was attributed. In answer to the British Indian protests, however, the Ameer issued strict commands, calling back his subjects and forbidding the Afghans to cross the border, and as a result gradually the raiding ceased.

AGRICULTURAL EDUCATION. A review of conditions in agricultural education at the close of 1908, as compared with twelve years ago at the beginning of the administration of Secretary James Wilson showed a remarkable development. In 1897 the total income of the agricultural and mechanical colleges was \$5,000,000, in 1908 it was over \$18,000,000. The property of these institutions was then valued at \$51,000,000, in 1908 at \$106,000,000. Then there were less than 4,000 students in agricultural courses, in 1908 there were nearly 14,000. In the field of secondary and elementary instruction in agriculture the progress was even more remarkable. In 1897 Minnesota had the only well established State agricultural high school, while Alabama was just launching its system of Congressional district agricultural schools. In 1908 there were 15 agricultural high schools of the Minnesota type and 40 other agricultural high schools receiving State aid, 16 privately endowed colleges and high schools giving secondary instruction in agriculture, 115 State and county normal schools preparing young people to teach agriculture, and several hundred public and private high schools and academies giving some instruction in agriculture. There were also 16 institutions offering correspondence and reading courses in agriculture.

In 1897 the teaching of agriculture in the public elementary schools was scarcely thought of, in 1908 there were 13 States in which it was required by law in the rural public schools. It was encouraged by State and county school officers and taught in some of the rural schools of 31 other States. In all 41 States and outlying possessions were making some effort to teach their youth the underlying principles of agriculture.

THE GRADUATE SCHOOL OF AGRICULTURE. The Third Session of the Graduate School of Agriculture was held at Ithaca and Geneva, New York, July 6 to 31, under the auspices of the Association of American Agricultural Colleges and Experiment Stations with Dr. A. C. True as dean. A combination of favorable circumstances resulted in a session of unusual interest and importance, and an enrollment that was much larger than at either previous session. The course of study embraced seven main lines; biochemistry, agronomy, horticulture, entomology, dairy husbandry and dairying, poultry, and veterinary medicine. The instruction was given by means of lectures and seminars which were supplemented by a number of special sessions and conferences relating to agricultural education. The faculty numbered 60 in addition to 18 speakers at special sessions and conferences. These included 19 officers of the United States Department of Agriculture, 25 members of the faculty of Cornell University, 7 members of the staff of the New York State Experiment Station, and 17 professors and experts from 10 other agricultural colleges and experiment stations, besides the United States Commissioner of Education, representatives from universities not included among the land-grant institutions, one representative from Carnegie Institution, Director A. D. Hall of Rothamsted Experiment Station, England, and Professor Dr. N. Züntz, professor of animal physiology in the Royal Agricultural College of Berlin. The total enrollment of students was 164, including 15 who were also registered in the Graduate School of Home Economics. There were students from

THE COLLEGE OF AGRICULTURE AT CORNELL UNIVERSITY
ITHACA, NEW YORK

37 States and the District of Columbia, 9 students from Canada, 2 from China, and 4 from India. More than two-thirds of these students held positions in the agricultural colleges and experiment stations, and at least 40 of them were heads of departments.

AGRICULTURAL COLLEGES. The agricultural and mechanical college of Hawaii was designated the College of Hawaii, and located at Honolulu. It opened its doors February 3, 1908, with the inauguration of a preparatory course and followed two weeks later with a short course which was attended by about 50 students. The legislature of Porto Rico appropriated \$40,000 for a college of agriculture and mechanic arts at Mayaguez. This was to be a department of the University of Porto Rico which now includes, in addition to the college of agriculture and mechanic arts, a normal department, an agricultural department, and an elementary industrial school, all at Rio Piedras. The College of Hawaii and the University of Porto Rico were designated by the Secretary of the Interior to receive the benefits of the Act of 1890, and supplementary acts appropriating Federal funds for the encouragement of instruction in agriculture and the mechanic arts in the several States and Territories.

The noteworthy appropriations of the year 1908 for agricultural college buildings and maintenance included \$200,000 in Kentucky, \$93,000 in Massachusetts, \$240,000 in Ohio, \$61,000 in New Jersey, and \$87,000 in Oklahoma. New buildings for instruction and laboratory work in agriculture were completed at the Ohio State University, Pennsylvania State College, University of Tennessee, Nebraska School of Agriculture, New Hampshire College of Agriculture and the Mechanic Arts, and University of Wyoming. The University of California expended during the year more than \$780,000 on buildings, including \$53,000 on new buildings at the University Farm at Davis. At the University of Maine the cornerstone for a new \$50,000 agricultural building has been laid, and at the University of Missouri the contract has been let for a new agricultural building and cold storage and ice-making plant to cost \$100,000. The University of Georgia is completing a \$100,000 agricultural building.

The agricultural colleges have given much attention to the development of graduate departments and to the strengthening of their agricultural courses. The formal opening of the Graduate School of the University of Illinois, which is supported by a State appropriation of \$50,000 annually, occurred February 4 and 5, 1908. The Bussey Institution, established in 1870 as a school of agriculture of Harvard University, was closed as an under-graduate institution and was to be superseded by an institution for advanced instruction and research in agriculture. The Massachusetts Agricultural College made formal announcement of a graduate department and reorganized its faculty into divisions of agriculture and horticulture with a dean at the head of each. It was the plan eventually to group all the departments of the college into divisions in charge of deans. Similar action was taken at the Alabama Polytechnic Institute where deans have been placed in charge of the faculties of the academic department, engineering and mines, and agricultural science. At the Oregon College the entrance requirements to the college courses were

raised and a two-year industrial course was established to connect the elementary schools with the college. The college was also organized into schools of agriculture, engineering and mechanic arts, domestic science and arts, and commerce, and professorships were established in veterinary science and industrial pedagogy. In Georgia a much larger proportion of general instruction in agriculture was introduced into the freshman and sophomore years, and electives were provided for the junior and senior years to allow students to specialize in agronomy, animal husbandry, horticulture, or agricultural education. The Wisconsin University took similar action with reference to its four-year course in agriculture and established a two-year middle course with entrance requirements the same as for the four-year course but with a larger percentage of agricultural work than is given in the first two years of the regular four-year course. The New York State College of Agriculture was among the first of the colleges to announce definite requirements in farm practice for graduation from the four-year courses. Candidates for degrees must know how to harness and drive horses, prepare land, cultivate, plant and harvest crops, and perform other practical operations of the farm, orchard and garden. This institution was also offering its students definite training for farmers' institute work and other forms of extension work. The Rhode Island College gave its courses of study a general reorganization, providing among other things a four-year teachers' course in applied science with options in agriculture, chemistry and biology. Clemson College in South Carolina adopted a plan to differentiate more clearly the work of the college from that of the experiment station and provided for the appointment of several new men in its college of agriculture. It also established a permanent school of cotton grading, designed to train experts in handling and marketing cotton. The colleges were also actively engaged in developing courses intended to train teachers of agriculture for elementary and secondary schools. The University of Nebraska established a teachers' college which offered considerable work in agriculture, the Michigan Agricultural College organized a department of agricultural education. Summer schools for teachers of agriculture were held at the agricultural colleges in Nebraska, Michigan, Massachusetts, Minnesota, North Carolina, Tennessee, and Wisconsin.

COLLEGE EXTENSION AND SHORT COURSES. The short courses for adult farmers developed rapidly and in many cases along highly specialized lines. Summer schools of forestry were held in California and Minnesota. Extension departments were established in Wisconsin, Indiana, and West Virginia. In New York a State agricultural experimenters' league was organized to aid in the coöperative and demonstration work of the extension department. "Farmers' Week" was the name given to one of the newer forms of short course work which has been of material assistance to many adult farmers. Farmers' Institutes were held during the year in all of the States excepting Louisiana and Nevada, and in all the Territories excepting Alaska and Porto Rico. In 45 States and Territories the number of institutes held was 4,643, a total of nearly 15,000 sessions with an attendance of over 2,000,000 persons. The total appropriations for this work amounted to over

\$325,500, an increase of \$41,000 over 1907. Eleven States reported round-up institutes, 8 ran railroad special trains, 10 held movable schools of agriculture with an attendance of 6,849, and 2 held field meetings continuing through 9 days. There were 732 women's institutes in 15 States, 174 boys' institutes in 5 States, and many other special forms of institute work.

ELEMENTARY AND SECONDARY SCHOOLS. There was rapid progress in the movement for the teaching of agriculture in schools below college grade. Secondary schools of agriculture were established in connection with the agricultural colleges in South Dakota, Texas and Virginia. The appropriation for each agricultural high school in Alabama was increased from \$2,500 to \$4,000 annually, and the legislatures in Michigan and Mississippi provided for the establishment of county agricultural high schools. New agricultural high schools were appropriated for in New York, at Alfred and at Morrisville. Virginia appropriated \$20,000 a year for two years with which to commence the teaching of agriculture and domestic science in one high school in each Congressional district. The Oklahoma legislature, in carrying out the provisions of the State constitution requiring the teaching of agriculture and domestic science in the common schools, provided for the most comprehensive scheme of instruction in agriculture to be found in the United States. This included the State Agricultural and Mechanical College, several State normal schools in each of which there was a department of agricultural and industrial education, agricultural high schools in each judicial district of the State, and the teaching of agriculture and domestic science in every public school. Two of the agricultural high schools were established and four of the State normal schools were teaching agriculture by the end of the year. Several public high schools in Illinois, Minnesota, Tennessee, Texas, and other States recently organized courses in agriculture on an efficient basis. West Virginia and Oklahoma added to the list of States requiring the teaching of agriculture in all rural schools. Boys' agricultural clubs and girls' domestic science clubs were coming to be effective agencies for extending the work of the elementary schools in many of the States. The most recent and notable developments in this movement have been in Georgia, Indiana, Michigan, and Nebraska.

LITERATURE. The year was noteworthy for the appearance of an unusual number of text-books and other aids in elementary agriculture. Among the text-books are the following: C. W. Davis, *Rural School Agriculture*; F. S. Earle, *Southern Agriculture*; J. F. Duggar, *Agriculture for Southern Schools*; A. M. Soule and E. H. Turpin, *Agriculture: Its Fundamental Principles*; W. C. Welborn, *Elements of Agriculture*; A. M. Ferguson and L. L. Lewis, *Elementary Principles of Agriculture*; and A. W. Nolan, *One Hundred Lessons in Agriculture*.

AGRICULTURAL EXPERIMENT STATIONS. The development of the stations in the United States continued to be most powerfully affected by two opposite influences. On the one hand the amount and character of the scientific work was rapidly being changed for the better through the operation of the Act of Congress

of March 16, 1906 (Adams Act). This opened the opportunity for an increase in the amount of "original research" in agriculture and at the same time by its limitations necessitated the employment of a much greater number of thoroughly trained scientists. The effect of this was manifested not only in increased specialization of research work and the more complete separation of the experiment station from the departments of instruction in the agricultural colleges, but also by the creation of a stricter scientific atmosphere and point of view in the stations. On the other hand public demand for practical information having a scientific basis broadened greatly. This could no longer be satisfied by the dissemination of such information through publications. More and more there was insistence on local tests and demonstrations in order that practical farmers and horticulturists might have ocular evidence that the results claimed by the stations really could be applied to the practice of agriculture. The stations therefore were led to organize this more popular work in a much broader way than heretofore. It was not difficult to secure liberal grants of money from the State legislatures for these purposes and the establishment of substations, demonstration fields and cooperative experiments therefore proceeded rapidly in many States. This movement had in many features run parallel with that of the agricultural colleges in the development of various forms of extension work and the respective relations of colleges and stations to these popular enterprises have not yet been fully settled.

The increased popular interest in the inspection of foods, feeding stuffs, fertilizers, insecticides, fungicides, and other materials also led to largely increased burdens on the stations in their work related to such inspection. It was natural, therefore, that the attention of the agricultural colleges and experiment stations should have been largely centered in 1908 on the problems of perfecting organization to meet the new conditions confronting them. It was for this reason that the report of the Commission on Agricultural Research appointed in 1906 by the Association of American Agricultural Colleges and Experiment Stations was awaited with great expectation. This Commission consisted of President David Starr Jordan of Leland Stanford, Jr., University, California; President Carroll D. Wright of Clark College, Massachusetts; Dr. H. P. Armsby of State College, Pennsylvania; Dr. W. H. Jordan of the New York Agricultural Experiment Station, and Mr. Gifford Pinchot of the United States Department of Agriculture.

By the terms of its instructions the work of the Commission was strictly limited to an inquiry on the organization and policy "that should prevail in the expenditure of public moneys provided for scientific experimentation and research in the interests of agriculture." Its report, submitted to the convention of the Association at Washington in November, 1908, contained the following recommendations, which after discussion were adopted by the Association:

(1) Every effort should be made to promote the training of competent investigators in agriculture both in the agricultural, and, so far as practicable, in the non-agricultural, colleges and universities, and their training should be as broad and severe as for any other field of research.

(2) The progress of agricultural knowledge now demands that agricultural research agencies shall deal as largely as possible with fundamental problems, confining attention to such as can be adequately studied with the means available.

(3) The work of research in agriculture should be differentiated as fully as practicable, both in the form of organization and in the relations of the individual investigator, from executive work, routine teaching, promotion and propaganda, and should be under the immediate direction of an executive trained in the methods of science who should not be hampered by other duties of an entirely unlike character.

(4) The investigator should be free from all coercion whatever. In reaching his conclusions he should be equally free from the prescription of received opinion and the temptation to exploit his results for the purpose of obtaining future support. To this end, his work should be as far removed from immediate dependence upon legislation as is consistent with due responsibility to the public, and his relations to the public and to the organization of which he is a member should be such as to promote individual initiative and not interfere with freedom of conclusion or utterance on scientific questions.

(5) There should be a clearer definition of the relative fields of work of the United States Department of Agriculture and the experiment stations. The dominance of the stations within their respective fields should be preserved and their growth fostered, as agencies for the investigation of local questions and of the more individual scientific problems. The federal agency, on the other hand, should cultivate the almost limitless field offered by questions having national or interstate relations and by those broad scientific problems requiring heavy expenditures, elaborate equipment, long continued study and the correlation of the results of many investigators, which efforts are usually beyond the means of an individual station. On many questions the harmonious coöperation of the two agencies is essential to the highest efficiency of effort.

(6) Any research agency charged with a single main line of investigation should be so organized that it may employ within itself all necessary processes in any branch of science. The coöperation of any or all the departments of an experiment station on a single problem, when necessary, should be a fundamental requirement.

(7) Research work, both national and state, should be provided for by separate, lump-sum appropriations, to be distributed according to the discretion of the responsible executive head of each agency.

(8) Investigation into the business, economic, social and governmental conditions affecting agriculture should be undertaken and should be maintained on a permanent and effective basis.

(9) An advisory board is suggested, consisting of members appointed by the Secretary of Agriculture and by the Association of American Agricultural Colleges and Experiment Stations respectively, which shall confer with the Secretary of Agriculture regarding the mutual interests of the Department and the Stations and shall consider the promotion of agricultural investigation in general.

The report of the Commission was supplemented by that of the standing committee of the association on station organization and policy, which dealt with several of the matters discussed in the former report but in a more specific way. It has especial interest because it was to a large extent based upon the consensus of opinion of station men as to the most practicable means of securing the highest efficiency in station work.

This committee recommends that administrative officers should be scientists as well as good business men with a large outlook, that the station work should be concentrated on a few definite and well-planned projects, that every effort should be made to retain experienced and well-trained investigators, that if inspection work is done at all it should be clearly differentiated from research as regards funds, workers and laboratories; and that investigators should do little, if any, teaching.

Federal funds were used in the maintenance of at least one experiment station in each of the States and Territories, including Alaska, Hawaii, Porto Rico and Guam. In Alabama, Connecticut, Hawaii, Louisiana, Missouri, New Jersey, New York and North Carolina separate stations were maintained wholly or in part by State funds, or by private contributions. There were also a considerable number of substations. Excluding the substations, there are 61 stations in the United States, 56 of which receive appropriations provided for by Acts of Congress. The staff of these stations includes over 1100 administrative officers and scientific workers.

The total income of stations maintained under the Act of 1887 (Hatch Act) during 1907 was \$2,334,672, of which \$1,056,000 (Hatch fund \$720,000, Adams fund \$336,000) was received from the National Government, the remainder, \$1,278,672, coming from the following sources: State governments, \$770,016; individuals and communities, \$15,360; fees for analyses of fertilizers, \$119,471; sales of farm products, \$169,553; miscellaneous, \$204,272. In addition to this the Office of Experiment Stations had an appropriation of \$293,220 for the fiscal year 1908, including \$72,000 for the insular stations; \$5,000 for nutrition investigations; \$150,000 for irrigation and drainage investigations, and \$5,000 for farmers' institutes and agricultural schools. The value of the additions to the buildings and equipment of the stations in 1907 was \$387,662. During the year the stations published 459 annual reports, bulletins, and circulars, which were supplied to about 775,000 addresses.

The general results obtained by the Office of Experiment Stations during the twenty years of its existence as a general agency for the promotion of the interests of the stations were summed up by the Secretary of Agriculture in his report for 1908, as follows:

"By collecting and disseminating the results of their work, this Office has done much toward extending their influence throughout this and other countries; by collating the work of similar institutions throughout the world it has brought our stations into close and helpful touch with the whole field of agricultural science; by setting high standards of organization and work, it has led the stations to make constant progress in establishing themselves on firm foundations and increasing the efficiency of their operations; by tactful, yet cordial, criti-

cisms of their work and expenditures, it has done much toward strengthening the weak places and effecting a wise and satisfactory use of the public funds entrusted to the stations. Its relations with the stations have never been more cordial than they are at present, and its influence never broader nor more potent."

By authority of Congress a station was established in 1908 under direction of the Office of Experiment Stations in the Island of Guam. This fertile island of nearly 300 square miles had a population of over 10,000 people who formerly were chiefly engaged in agricultural pursuits. But so many cultivators had left their plantations that not sufficient food was produced to properly sustain the inhabitants. Rice and other food stuffs were imported from Japan. Road building and other internal development work undertaken since the American occupation of the Island could not be continued on a large scale and something must be done to get the people back on their farms. The Island was under the control of the Navy Department and the governors had undertaken some experiments in agriculture, which were to be continued and expanded at the new station. There were now attempts to grow corn, rice, coffee, cacao, sugar cane, beans, tobacco, sweet potatoes and yams, with more extensive plantings of bananas, coconut and breadfruit trees. The first work of the station was to be with a number of these crops. There was a great lack of cultivated grasses and pastures and need of legumes for forage and soil renovation. Studies of a kind of mealy bug which has attacked the coconut trees were begun.

At the Hawaii Station experimental shipments of pineapples to San Francisco and Chicago demonstrated that this fruit can be marketed in good condition at any point within thirty days communication with Honolulu. (See HORTICULTURE.) Experiments in harvesting salt-marsh rice for hay showed that Hawaii could produce enough rice hay to supply the local market and that this would be more profitable than the production of a low grade of rice for human food.

In Porto Rico experiments with introduced coffees were beginning to give good results and the Java coffees were thought likely to retain their characteristic flavor when grown under Porto Rican conditions. The East Indian mango, also introduced, seemed well adapted to all sections of the island. The station's work in breeding pigs and poultry already was attracting much favorable attention. A dairy and silo have been built. A station building was being erected with \$20,000 appropriated by the insular legislature.

A new station was opened in Alaska near the flourishing town of Fairbanks on the Tanana River and farming operations are to be conducted there on a relatively large scale. Some varieties of oats, barley, and wheat were found to have matured grain every year since 1900 at Rampart in the Yukon Valley. The station's live-stock work was consolidated at Kodiak where there was a thriving herd of 60 pure-bred Galloway cattle.

In Portuguese East Africa a central experiment station with provision for work in agriculture, entomology and veterinary medicine was established at Lourenco Marques and plans were being made for substations at Chai-Chai on the Limpopo River, at Inhambane south of, and at Quelimane north of, the Zambesi River.

An agricultural reconnaissance of East Africa and Zambesia was to be undertaken, under the charge of Mr. O. W. Barrett formerly of the U. S. Department of Agriculture. In the Gold Coast a station was established at Kumasi for experiments with rubber, cotton and jute and an experimental cotton farm at Labo-labo is being conducted by the British Cotton Growing Association.

An annual appropriation of \$97,000 was placed at the disposal of the director of agriculture of Tunis for the improvement and encouragement of the cultivation of native plants. A part of this fund was being used for establishing experimental fields. A recent report in *Experiment Station Record* on the moor experiment stations in Germany indicates that they are doing much to bring into agricultural use large tracts of land which have lain idle for centuries.

AGRICULTURE. Agriculture continued to prosper exceedingly during 1908. Though climatic conditions, the ravages of insect pests and fungi, the increasing scarcity of farm labor and other untoward conditions resulted in reduced yields of some crops, the aggregate value of farm products in the United States reached the maximum in the nation's history. The improved financial status of the farmer enabled him to improve his farm, his home and his manner of life in increasing degree. He availed himself as never before of the efforts of public agencies for his welfare, such as the Federal Department of Agriculture, the State experiment stations, agricultural colleges and schools, State boards and commissioners of agriculture, and other factors making for rural betterment, and these have been unusually active and effective. More attention likewise was accorded by the general public to his problems and needs, and the year has been notable for the evident trend of public interest toward rural life and increased recognition of the dignity and importance of agricultural interests.

CROP YIELDS AND VALUES. The corn crop of the year aggregated 2,668,651,000 bushels, which is slightly above the average for the past five years. The value, owing to the high price per bushel, was about 3 per cent. above the five-year average and reached \$1,616,145,000, a sum sufficient to cancel the interest bearing debt of the United States, and to pay for the Panama Canal and 50 battleships. The cotton crop was 12,920,000 bales, and for the first time in the history of the country's agriculture, it is estimated to exceed the hay crop in value, although the farm price for cotton was two cents per pound lower than in 1907 and the hay crop of 70,798,000 tons was the largest ever harvested and its value, \$635,423,000, fully 6 per cent. above the five-year average.

The spring wheat crop suffered considerably from drought, but this shrinkage was more than counterbalanced by the winter wheat crop which brought up the total yield to a little above the five-year average. Of the total quantity, 664,602,000 bushels, over 50,000,000 bushels were of the durum or macaroni type which was proving especially adapted to growth in regions with deficient rainfall. The value of the wheat crop was \$616,826,000, which was more than \$60,000,000 in excess of that for any previous year. The oat crop, 807,156,000 bushels, valued at \$381,170,000, was decidedly larger and more valuable than for the year previous although because

of protracted drought it was somewhat below the five-year average. With barley, both the production, 166,756,000 bushels, and the value, \$92,442,000 had been exceeded only once. The yield of rye, 31,851,000 bushels, was practically an average crop, but its value, \$23,455,000, had been exceeded but once. The rice crop, 21,890,000 bushels, valued at \$17,771,000, was the largest and most valuable ever raised. The farm value of all cereal crops (including corn and buckwheat) was estimated at \$2,759,814,000, nearly \$400,000,000 above that of 1907, and about 35 per cent. above the average for the previous five years.

The sugar beet crop, valued at \$21,500,000, exceeds in both quantity and value all previous years. The tonnage exceeds the five-year average by 45 per cent. The plantation value of sugar cane, molasses and sirup is estimated at \$34,000,000, about 10 per cent. above the five-year average. The sugar production of the year was estimated at about 900,000 short tons, an amount much above the total for the highest previous year. The total value of the refined sugar from beets, the raw sugar from cane, the beet pulp, the molasses and sirup of cane and sorghum, and the maple sugar and sirup, was estimated at \$94,000,000.

Unfavorable weather reduced the potato crop to 278,985,000 bushels, but the value, \$197,039,000, has never been equalled. Tobacco production was below the average because of depressed prices, but the value, \$70,000,000, was about that of 1907. On account of the extremely low price realized for hops in 1907, the production and value, estimated respectively at 39,000,000 pounds and \$4,000,000, are much below the five-year averages. For the first time the value of all farm crops equalled \$5,000,000,000.

Dairy products were valued at nearly \$800,000,000; poultry and egg products were worth as much as the cotton crop, the hay crop or the wheat crop. In the aggregate the value of animals sold and slaughtered and of animal products at the farm amounted to about three-eighths of the value of all farm products, approximating \$3,000,000,000.

EXPORTS. The exports of agricultural products were valued at \$1,017,000,000, an amount greater than for any year except 1907. The reduction of \$37,000,000 from that year was chiefly due to the falling off in value of cotton exports, but these were still the largest item, being valued at \$438,000,000, with grain and grain products second with \$215,000,000 and packing-house products third with \$196,000,000.

The exports in forest products are beginning to decline, chiefly in lumber and timber. The total exports from this country were apportioned in value as follows: animals and animal products, 16 per cent.; cotton and cotton products, 27 per cent.; grain and grain products, 12 per cent.; all other products chiefly sustained by agriculture, 6 per cent.; forest products and other products chiefly dependent on them, 8 per cent.; and exports not of agricultural or forest origin, either fully or in principal degree, 31 per cent.

IMPORTS. The total imports of agricultural products in 1908 were valued in the countries from which they were exported at \$540,000,000. The chief items were silk, wool, hides, coffee, various vegetable fibres and oils, fruits, sugar and molasses, tea and tobacco. There was diminution in value of \$87,000,000, principally in

packing-house products. There was also a diminution of \$24,000,000 in forest products, found almost entirely in india rubber, but there were gains in pulp wood and wood pulp.

The annual balance of international trade is computed as in favor of the United States to the extent of \$488,000,000 for farm products, while for all other products it was \$178,000,000. The agricultural balance was exceptionally high, having been equalled only in 1901 and 1898. It is also remarkable as having been attained in spite of the steady growth of the population, the immigration of non-agricultural peoples, and the diminishing fraction of the population that is engaged in agriculture.

FARM VALUES. The number of farms in 1908 was estimated at 6,100,000, an increase of 33.6 per cent. since 1890. The acreage increased during the same period from 623,000,000 to 839,000,000 acres. The capital of the farmer in the forms of land, buildings, improvements, live stock and machinery was estimated at about \$28,000,000,000, an increase of from 75 to 80 per cent. over 1890. The value of the farm animals on farms and ranges Dec. 31, 1908 was estimated at \$4,525,259,000, an increase of \$194,029,000, or 4.5 per cent. during the year. The abandoned farm and the run-down cotton plantation that no lender wanted as a mortgage security were being sought for investment, and their owners could borrow without mortgaging. Bank deposits in the distinctively agricultural States also largely increased, and while these deposits were not entirely from farmers, the gain was largely derived from the increased returns from the sales of farm products.

LEGISLATION. Federal legislation during 1908 pertaining to agriculture was embodied largely in the appropriation act for the Department of Agriculture. In this act provision was made for the continuance of most of the lines of work already under way, and notably larger sums were made available for the administrative duties, such as the management of the National Forests, the pure food and drug inspection, and the campaign against the gipsy moth, cattle tick and boll weevil. Among the new lines of work authorized may be mentioned the inauguration of evaporation investigations by the weather bureau and studies of the extent and prevalence of tuberculosis among dairy cattle, the making of denatured alcohol under farm conditions, the testing of plants for paper-making, an inquiry into the production of turpentine and resin, and the establishment of a standard of cotton grading. Provision was also made by Congress for publishing 100,000 copies of the Special Report on the Diseases of Cattle. A large number of bills of agricultural interest were introduced into Congress including measures to extend National aid to secondary agricultural schools, branch experiment stations and normal schools, to provide for instruction in forestry and mining in agricultural colleges, to provide for an agricultural census, to establish Federal grain inspection, to regulate commerce in nursery stock and insecticides, to extend National aid to a variety of drainage projects and to public highway improvement, to establish postal savings banks, to extend the parcel posts privileges on rural free delivery routes, to repeal the tax on oleomargarine, and to acquire National forest reserves in the Southern Appalachian and White Mountains, but none of these bills was enacted during the year.

The State legislatures as a rule made more liberal provision for the work and equipment of the agricultural colleges and experiment stations than ever before (see AGRICULTURAL EDUCATION and AGRICULTURAL EXPERIMENT STATIONS), indicating a growing appreciation of the value of these institutions. Mississippi, Oklahoma and Virginia authorized the establishment under certain conditions of county or district agricultural high schools. In Mississippi boards of supervisors were empowered to offer prizes to boys for corn-growing contests. A live stock sanitary board and county commissioners of agriculture were provided in Mississippi, and New Jersey established a live stock commission with authority to purchase and maintain for service stallions of draft and coach types, and to make regulations relative to the use of other breeding animals. Kentucky passed a new food and drug law and Mississippi a feed stuffs inspection law. Massachusetts enacted several laws in the interest of forestry work.

COMMISSION ON COUNTRY LIFE. The year was especially noteworthy for the increased interest in agricultural welfare on the part of the general public. In August, a special commission was appointed by President Roosevelt to gather information relative to the betterment of the social, sanitary and economic conditions of country life as the basis for recommendations to Congress. This commission, known as the Commission on Country Life, was made up of Dean L. H. Bailey of Cornell University, chairman, Henry Wallace, editor of *Wallace's Farmer*, President K. L. Butterfield of the Massachusetts Agricultural College, Gifford Pinchot of the National Forest Service, and Walter H. Page, editor of the *World's Work*. Subsequently Charles S. Barrett of Georgia and William A. Beard of California were added to the commission. The commission devoted itself principally to securing a consensus of opinion as to the actual conditions prevailing over the country with reference to social and sanitary conditions surrounding country life, the educational facilities, the facilities for communication and for the conduct of business, farm labor and tenancy, coöperation in buying and selling and related matters, as well as becoming familiar with the various agencies in a position to assist in promoting rural welfare. Over 600,000 copies of a circular of inquiry were distributed not only to the farmers themselves but to men in contact with country life, members of agricultural organizations, business men, newspapers, country ministers and physicians, women's clubs, village improvement societies and rural delivery carriers. The commission also made a tour of the country, holding hearings at convenient points in the various sections. An unusual amount of interest and discussion was aroused in these ways, especially through the agricultural press and much good was accomplished by setting people to thinking seriously of the problems confronting country life and of the agencies necessary for their solution.

CONSERVATION OF NATURAL RESOURCES. The general subject of the conservation of all the natural resources received an unusual amount of attention during the year. A conference of the governors of the States, accompanied by a corps of scientists and other advisers, held a three-day session in May at the White House at the call of President Roosevelt. Forestry, irrigation and drainage were the agricultural phases most prominently before the conference,

but attention was also directed to soil conservation and a notable address was made by Mr. J. J. Hill on "The Natural Wealth of the Land and Its Conservation." Subsequently a Commission on the Conservation of the Natural Resources was appointed by President Roosevelt, which organized under sections of waters, forests, lands, and minerals, and held sessions in Washington in December. One practical outcome of this meeting was the withdrawal from entry pending examination of about 7,500 square miles of public lands in Wyoming, Idaho, and Utah believed to contain phosphate deposits of great value.

Another significant development of the year was the increasing recognition of agricultural work by educational and scientific bodies. In the National Education Association a department of rural and agricultural education was organized coördinate with other departments, and the February meeting of the department of superintendence was given up very largely to agricultural and other features of industrial education. The American Economic Association devoted an entire session of its annual convention to agricultural questions. At the Baltimore meeting of the American Association for the Advancement of Science at least 150 of the 1000 papers presented were of direct interest to agricultural science, many being by workers in the Department of Agriculture and the agricultural colleges and experiment stations.

Most of the numerous bodies immediately concerned with agricultural work held meetings during the year. The American Nature Study Society was formed at the beginning of the year for the advancement of all studies of nature in elementary schools. On December 31, the American Home Economics Association was organized in Washington, D. C. with an initial membership of over 800, with its purpose the furtherance of the study of home problems. The American Society of Animal Nutrition was formed at Chicago in November to promote investigation work in animal nutrition. The third session of the Graduate School of Agriculture was held at Ithaca and Geneva, N. Y. with the largest and most representative enrollment in its history. See AGRICULTURAL EDUCATION.

Questions arising in connection with the administration of the National Pure Food and Drugs Act, especially with reference to the propriety of the use of sulphur dioxide in the preparation of food products led to the appointment by President Roosevelt of a Referee Board on Foods with power to render a final decision on any matters of controversy. See FOOD AND NUTRITION.

FOOT-MOUTH DISEASE. An outbreak of contagious foot-and-mouth disease was reported in November. It is believed the infection was introduced from abroad as no cases had been known in this country for six years. A quarantine against the interstate movement of cattle from the States affected, viz., Maryland, Michigan, New York and Pennsylvania, was declared and a vigorous campaign of extermination was begun by the Federal Department of Agriculture.

CORN EXPOSITION. The second National Corn Exposition, declared by a farm journal to have been "the most elaborate demonstration of farm products ever held in this country," was held at Omaha, Neb., Dec. 9-19. Nearly 10,000 different exhibits relating more particularly to the production and utilization of corn, wheat, oats,

alfalfa and other crops were shown, representing 28 States. The prizes offered aggregated in value over \$50,000, and the attendance was estimated at 100,000. Unusual attention was given to educational phases, there being special exhibits of the work of 12 agricultural colleges and experiment stations, exhibits of farm machinery, a model kitchen, a students' judging contest, a distillery plant for the production of denatured alcohol, and a large amount of illustrative material from schools, boys' corn clubs and similar organizations.

LIVE STOCK EXPOSITION. The ninth International Live Stock Exposition held in Chicago Nov. 28 to Dec. 10, was as usual a great success. There were over 3,000 exhibits of cattle, horses, hogs and sheep and the attendance exceeded 500,000. The agricultural colleges and experiment stations were again conspicuous factors. The grand championship in the single steers contest, one of the most highly coveted honors, was awarded to Purdue University on the Angus two-year-old Fyvie Knight. A students' judging contest was participated in by 8 teams from institutions and won by the Iowa State College. The third National Dairy Show, held at Chicago during the Live Stock Exposition, was also successful, though the cattle exhibits were seriously curtailed by the quarantine for foot-and-mouth disease. Special features were a milk and cream contest representing 20 States and a students' judging contest.

INTERNATIONAL INSTITUTE OF AGRICULTURE. Considerable progress was made during the year in the organization of the International Institute of Agriculture, which was supported by 48 nations. A palatial building to serve as headquarters was erected by the Italian Government in Rome and was formally opened by the King May 23. A meeting of the general assembly of delegates which compose the management of the Institute was begun in November, Signor Tittoni, the Italian minister for foreign affairs, being elected president. Among the purposes outlined for the Institute were the collection, study, and publication of statistical, technical and economic information concerning farming, the commerce in farm products, and the prices prevailing in the various markets; the ascertainment of the wages paid farm labor; the publication of information concerning new plant diseases which may appear; the publication of information concerning agricultural coöperation, insurance and credit; and the submission to the adhering governments of measures for the protection of the common interests of farmers and for the improvement of their condition.

The international meetings of agricultural interest during the year included the great International Congress on Tuberculosis at Washington, D. C., at which considerable attention was given to bovine tuberculosis, the First International Congress for the Repression of Adulteration of Alimentary and Pharmaceutical Products, held at Geneva, Switzerland, and the First International Roads Congress and the First International Congress of the Refrigerating Industries, both at Paris.

AGRICULTURAL COÖPERATION. Economic coöperation by farmers in the United States continued to develop and it was estimated that more than one-half of the 6,100,000 farms were represented in this coöperation; the faction would be much larger if based on the total number of the more progressive type of farmers, to which

the coöperators mostly belong. The number of farmers' coöperative economic associations was believed to be fully 75,000, with a membership of over 3,000,000. Contrary to his reputation, the farmer is a great organizer, and he has achieved remarkable success in many lines of coöperation in which the people of other occupations have either made no beginning at all or have nearly if not completely failed. The lines along which farmers have more especially developed coöperation are five: live stock and tornado insurance, with cheese making and selling; irrigation; the warehousing of grain and cotton; telephone service and coöperative buying and selling. The buying was conducted by about 350 coöperative stores and more extensively by groups of farmers who buy potatoes, wheat, and other products for seed, or who buy from certain merchants and manufacturers under an agreement for discount from regular prices. Associations to regulate, promote, and manage the details of selling farmers' products were found in all parts of the United States. There was coöperation for selling by the growers of fruits, vegetables, nuts, and berries; by live-stock men; by the producers of cotton and tobacco, wheat, sweet potatoes, flax, oats, eggs, poultry and honey. Farmers coöperate to sell milk for city supply, to sell wood, cantaloupes, celery, cauliflower, citrus fruits, apples, and many other products.

There was also an immense number of farmers' associations of a semi-economic and educational character.

NEW BOOKS. Among the books of the year on agricultural topics were the following: W. F. Massey, *Practical Farming* (New York); L. H. Bailey—*Cyclopedia of American Agriculture*, Vol. III., "Farm Animals" (New York); C. E. Green and D. Young, *Encyclopedia of Agriculture* (Edinburgh and London); C. W. Burkett, *Soils* (New York and London); E. B. Voorhees, *Forage Crops* (New York and London); W. R. Beattie, *Celery Culture* (New York); W. W. Tracey, *Tomato Culture* (New York); F. H. Chittenden, *Insects Injurious to Vegetables* (New York and London); T. Shaw, *Feeding Farm Animals* (New York and London); H. W. Mumford, *Beef Production* (Urbana, Ills.); E. V. Wilcox and C. B. Smith, *Farmers' Cyclopedia of Live Stock* (New York and London); A. A. Brigham, *Progressive Poultry Culture* (Cedar Rapids, Ia.); H. W. Conn, *Practical Dairy Bacteriology* (New York and London); J. Michaels, *Dairy Farming* (Clemson College, S. C.); H. E. Van Norman, *First Lessons in Dairying* (New York); J. B. Davidson and L. W. Chase, *Farm Machinery and Farm Motors* (New York and London); E. R. Jones, *Notes on Drainage* (Madison, Wis.); C. G. Elliott, *Practical Farm Drainage* (New York); L. H. Bailey, *The State and the Farmer* (New York); K. L. Butterfield, *Chapters in Rural Progress* (Chicago); J. Collings, *Land Reforms Occupying Ownership, Peasant Proprietary, and Rural Education* (London).

UNITED STATES DEPARTMENT OF AGRICULTURE. The rapid growth of this Department continued during the year 1908. On July 1, 1908, there were on its rolls 10,420 persons, 2,488 employed in Washington and 7,932 elsewhere. The net increase in the force during the year was 1,313. The Agricultural Appropriation Act for 1908 carried \$11,872,106, including \$720,000 for the State agricultural experiment stations. To this must be added an appropriation of \$460,000 for

printing, carried in the Sundry Civil Act, and permanent appropriations of \$3,000,000 for the Federal meat inspection and \$528,000 for the stations under the Adams Act, making a grand total of \$15,660,106 and an apparent increase over the previous year of \$2,320,814, or about 15 per cent. A large part of this increase however was to be covered by the receipts from the forest reserves, from which \$1,839,374 was derived in 1907. A reservation of 12,800 acres in the Flathead Indian Reservation in Montana for a permanent range for a herd of bison to be presented by the American Bison Society was provided for. The legal business of the Department greatly increased and included in 1908, 401 cases against railway companies for violating the "twenty-eight hour law" (limiting the number of hours stock can be kept in cars without unloading). During the fiscal year 1908 the Department issued 1,522 publications, of which about 500 were new. The total number of copies printed was 16,875,516, of which over 6,000,000 copies were Farmers' Bulletins. The new buildings for the Department, erected at a cost of \$1,500,000, were completed and occupied. The library moved to the new building contained 100,000 books and pamphlets, as compared with less than 1000 volumes when established in the old building in 1868. Exclusive of annual reports of societies and institutions, 1,850 periodicals were regularly received.

The Weather Bureau has continued and extended its studies in the upper air with a view to the improvement of weather forecasting. By means of kites and captive balloons carrying instruments, accurate records were secured of conditions existing in the atmosphere at altitudes of 1 to 4 miles. This work was done at Mount Weather in the Blue Ridge Mountains of Virginia. As the result of the upper-air explorations and the extension of telegraphic service to all parts of the Northern Hemisphere a beginning was made in forecasting weather conditions for a week in advance.

Agents of the Bureau of Plant Industry making agricultural explorations in China, Korea and Central and Northern Asia in 1908 secured for introduction several varieties of a "Chinese date," new persimmons, scions of the famous Feitcheng peach (which weighs over a pound), wild and cultivated pears and hardy forage crops, especially drought resistant species. Eleven stations for experiments in "dry-farming" were established in the Great Plains. The coöperative demonstration work for the diversification and improvement of agriculture in the South was proving very popular. The Bureau had about 160 men engaged in this work in eleven States from Texas to Virginia.

The Forest Service made good progress in perfecting its organization for the management of the National Forests. Near the end of 1908 a considerable portion of its Washington force was transferred to stations in the West with a view to dealing with the problems of the National Forests at closer range. See FORESTRY.

The Bureau of Chemistry created the organization necessary to put the pure food and drugs act into effect. Branch laboratories for the examination of samples have been established in 21 cities and the inspectors collected about 13,400 samples of foods and drugs during the year. See FOODS AND NUTRITION.

The Bureau of Soils has surveyed 306 different areas, lying in 44 States and 2 Territories

and including a total area of 157,078 square miles. The soil experts not only examine and classify the soils but also study farm practices, adaptation of crops to soils and fertilizer requirements. The Bureau is coöperating with the Reclamation Service in surveying soils covered by the various irrigation projects.

The most important work of the Bureau of Animal Industry in 1908, in addition to its extensive service in connection with meat inspection (q. v.) was the suppression of the outbreak of foot-and-mouth disease mentioned above. The Bureau of Entomology has conducted an active campaign against the gipsy and brown tail moths which have threatened the destruction of forest trees in New England. Efforts were being continued to find effective means of combating the cotton boll weevil and public interest was being aroused in the relation of the common house-fly to the spread of typhoid fever. The Biological Survey estimated the damage to property by the house rat at \$20,000,000 annually. This rodent was also to be actively combated because of its agency in spreading the plague and other diseases. Experiments with various poisons and mechanical means of destruction were in progress. Recent investigations showed that the Beechy ground squirrel was susceptible of plague and carried the germ of the disease, which, as in the case of rats, was communicated to men through the agency of fleas.

The Office of Experiment Stations, in addition to its important work in relation to the agricultural colleges, schools, experiment stations and farmers' institutes (see AGRICULTURAL EDUCATION and AGRICULTURAL EXPERIMENT STATIONS) was continuing investigations on human nutrition with the respiration calorimeter (see FOOD AND NUTRITION) and on irrigation and drainage (see IRRIGATION AND DRAINAGE). The report of the Secretary of Agriculture for 1908, contains an interesting review of the progress of agriculture and agricultural science in the United States during the twelve years in which Mr. James Wilson has presided over the Department.

AIKEN, WILLIAM MARTIN. An American architect, died on December 12, 1908. He was born at Charleston, S. C., in 1855. After attending the University of the South he studied architecture at the Massachusetts Institute of Technology, and entered the office of H. H. Richardson, in Boston. Later he practised his profession in Cincinnati, Ohio, where he also taught at the Art Academy of that city. In 1894 he was appointed supervising architect of the United States Treasury Department. In this capacity he designed the new buildings for the mints at Denver and Philadelphia, as well as numerous post-office buildings and custom houses. He was consulting architect for New York City during 1901-1902. In 1899 he was appointed lecturer in the school of Architecture at Columbia University. With Russell Sturgis he compiled the well-known *Dictionary of Architecture*.

AIR SHIPS. See AERONAUTICS.

ALABAMA. One of the South Central Division of the United States. Its total area is 51,998 square miles, of which 719 square miles are water. The population in 1900 was 1,828,697. According to the Federal estimate the population in 1908 was 2,080,936. The capital is Montgomery.

MINERAL PRODUCTION. Coal and iron are the principal mineral products of Alabama. In the amount of iron produced Alabama ranks third in the number of States, being surpassed only by Minnesota and Michigan. According to the figures of the United States Geological Survey, the production of iron ore in the State in 1907 was 4,039,453 tons, valued at \$4,863,129 as against 3,995,098 in 1906. This, however, on account of the higher prices received was valued at \$260,410 more than the output of 1907. The United States Geological Survey has carried on studies of the iron ore districts of Birmingham, and it is estimated that the resources of ore in this district amount to about 340,000,000 tons. It will be seen therefore that the annual ore production of the State, although it is great in actual quantity, is small compared to its possibilities. In many portions of the State where iron is known to exist in large quantities, practically no mining has yet been carried on. Pig iron produced in Alabama in 1907 amounted to 1,686,674 tons as against 1,674,848 tons in 1906. On Jan. 1, 1908, there were forty-nine blast furnaces in the State, of which fifteen were in blast. The decrease was the result of the panic and a somewhat general strike which lasted throughout July and August. There were 51 blast furnaces in the State on Dec. 31, 1908, of which 25 were in blast. The aggregate production of pig iron in 1908 was 1,397,014 tons. In addition to the general depression, Alabama iron producers suffered also from strikes during the year. As a coal producing State Alabama ranks fifth, being surpassed only by Pennsylvania, Illinois, West Virginia, and Ohio. Alabama produced in 1907, 14,240,454 tons of coal valued at \$18,405,468. Estimates prepared by the chief mine inspector and by the secretary of the Co-operators' Association of the State indicate that the coal production for 1908 will be between 12,500,000 and 13,000,000 tons. Of the coal mined in 1907 1,762,948 tons were mined by machines, 197 of these being in use in that year, a decrease from the number employed in 1906, which was 238. There were employed in the coal mines of the State 21,388 men as against 20,555 men in 1906. During 1907 there were killed in the mines of the State 154 men as compared with 96 killed in 1906. In the production of coke Alabama ranks third in the number of States, being surpassed only by Pennsylvania and West Virginia. There were forty-three coke making establishments in 1907, an increase of one over 1906. The total production was 3,021,794 short tons, valued at \$9,216,194 as against 3,034,501 tons in 1906 valued at \$8,477,899. There were in the State two by-product recovery plants with 280 ovens, all of which were operated during 1907. Other important mineral productions of the State are clay products which were produced in 1907 to the value of \$1,754,409 as compared with \$1,668,899 in 1906, and gold, lime, limestone, and graphite. See COAL; GOLD; PIG-IRON; IRON; SILVER.

AGRICULTURE AND STOCK RAISING. The acreage and production of principal crops in the State in 1908, according to figures of the United States Department of Agriculture were as follows: excepting cotton: Corn, 44,835,000 bushels, from 3,050,000 acres, valued at \$37,213,000; winter wheat, 1,092,000 bushels, valued at \$1,168,000, from 95,000 acres; oats, 4,230,000 bushels, valued at \$2,792,000 from 235,000

acres; rye, 20,000 bushels, valued at \$25,000 from 2000 acres; rice, 63,000 bushels, valued at \$50,400 from 1400 acres; potatoes, 1,275,000 bushels, valued at \$1,211,000 from 15,000 acres; hay, 176,000 tons, valued at \$2,200,000 from 110,000 acres; tobacco, 283,500 pounds, valued at \$73,710 from 630 acres. The most notable feature in the agricultural development of Alabama in the last few years is the increase in the production of corn, which in 1900 amounted to 29,300,000 bushels. Cotton is the chief agricultural product of the State. The cotton crop in 1908 was estimated at 1,273,000 bales as compared with 1,216,000 bales in 1907. Since 1903 the value of the crop has greatly exceeded that of the years previous.

The number of farm animals in the State has increased notably from 1900 to the close of 1908. At the end of the latter year the numbers were as follows: horses, 168,000; mules, 248,000; milch cows, 289,000; other cattle, 544,000; sheep, 184,000; swine, 1,238,000. The number of mules, milch cows and other cattle has markedly increased in the last few years. The estimated value of the wool clip in 1908 was \$136,500.

MANUFACTURES. Alabama made considerable progress in manufactures between the two censuses of 1900 and 1905. A comparison of eleven selected industries showed that they reported 1403 establishments, 45,248 wage-earners and products valued at \$60,459,793 in 1900, while in 1905 they reported 1,312 establishments, 54,073 wage-earners, and products valued at \$93,953,829. There was a small decrease in the number of establishments, but an increase of 19.5 per cent. in the number of wage-earners, and of 55.4 per cent. in the value of products. The value of products of the seven leading industries in 1905, with the per cent. of increase since 1900, were: iron and steel, \$24,687,359 (42 per cent.); cotton goods, \$16,760,332 (105 per cent.); lumber and timber products, \$15,939,814 (175 per cent.); foundry and machine shop products, \$9,122,874 (65 per cent.); railroad shop work, \$6,681,074 (60 per cent.); coke, \$6,175,126 (66 per cent.); and cottonseed oil and cake, \$5,769,061 (93 per cent.). The rapidly growing importance of Alabama as a manufacturing State is due mainly to two groups of industries, namely, cotton products and iron and steel with allied products. The value of the cotton manufactures more than doubled from 1900 to 1905. The number of active spindles increased from 772,727 in 1905 to 939,942 in 1908, Alabama ranking fourth among cotton growing States.

EDUCATION. In 1906, the nearest year for which statistics are available, the school population was 697,465, of whom 57 per cent. were white and 43 per cent. colored. The enrollment of white pupils was 230,005 and of colored 146,101. The teachers numbered 5966, of whom 4412 were white and 1554 colored. The average monthly salary of white teachers was \$41.73 and of colored, \$24.04. A law passed in 1907 provided for a high school in every county, and carried with it an annual State appropriation of \$200,000 to aid in paying the salaries of teachers in high schools established under it. The State has made important progress in educational advancement in recent years.

FINANCE. According to the report of the State Treasurer a balance remained in the Treasury on December 30, 1907 of \$1,819,736.80. The receipts from October 1, 1907, to September

30, 1908, were \$4,661,902.35 and the disbursements for the same period were \$5,120,805.53, leaving a balance in the treasury on Sept. 30, 1908, of \$1,360,833.62. Of the receipts, there were received from State tax in 1907, \$1,044,695.99; from the special school tax of 1907, \$1,282,366.66; from the Insurance Department, \$188,051.47; from the convict funds, \$891,512.87. For educational purposes there were disbursed \$1,669,156.61.

CHARITIES AND CORRECTIONS. The State charitable and correctional institutions include the Alabama Insane Hospitals at Tuscaloosa; Alabama Schools for the Deaf, Dumb and Blind at Talladega; Alabama Boys' Industrial School at East Lake, which is a reform school for white boys. The Bryce Hospital for Insane White at Tuscaloosa and the Mount Vernon Hospital at Mount Vernon, for Insane Negroes, are under the control of a Board of seven Trustees. In both institutions there were in 1908 1727 patients, 1129 being whites and 598 negroes. The State appropriates \$3.65 per capita a week for the maintenance and improvement of these institutions. For the Alabama School for the Deaf was expended in 1908, \$37,605, and for the building fund of the same institution, \$15,960; for the School for the Blind was expended \$20,240 and for the School for the Negro Deaf and Blind, \$11,500.

POLITICS AND GOVERNMENT. There was no session of the State legislature in Alabama in 1908. The year was notable for the gradual elimination of the legalized liquor traffic through the operation of the county local option law passed overwhelmingly by the legislature of the previous year. In addition to the county local option law the legislature provided for statutory state-wide prohibition, to become effective Jan. 1, 1909. A number of the larger counties, including Jefferson in which Birmingham is located, became "dry" Jan. 1, 1908, under local option. By the provisions of the statutory act all breweries and distilleries ceased operations July 1, 1908. Fifty counties of Alabama were dry on Jan. 1, many of them after bitterly contested elections. Attempts were at once made on the part of those interested in the sale of liquor to have the law declared unconstitutional and the Probate Judge of Cullman County issued nine saloon licenses for saloons in that county. The county voted on Dec. 8, 1907, for prohibition and the saloon men claimed that the local option law was unconstitutional because it was a local and not a general law, inasmuch as it made exception of counties which voted on the proposition prior to Dec. 12. The Probate Judge of Lowndes County refused to issue licenses, and application was made for a mandamus to compel him to take such action. On April 19 the Supreme Court of the State rejected the contentions made against the State local option Law and the Nine o'Clock Closing Law and held that these two laws were constitutional. There was no dissenting opinion. On April 21, a Federal Judge enjoined operation of the railroad rate laws passed by the legislature of 1907.

A serious strike took place at Birmingham in July and the miners resorted to such violence that three companies of State militia were ordered to Birmingham on July 17. Soon afterward an entire regiment was stationed in the various mining camps. A fight took place on July 17 at Adamsville between the miners and the sheriff's deputies, when the train bearing

strike breakers was held up by the miners. One deputy was killed and many strikers and sympathizers were wounded. On July 29 a non-union miner at the Pratt mines in Birmingham was attacked by striking miners and was killed. Two union miners were seriously wounded. On August 9th, 3 men were instantly killed and 11 injured when striking miners fired into a passenger train on the Birmingham Mineral Railroad at Blocton. Governor Comer at once ordered a company of militia to this place. For a discussion of the causes of these strikes, see article STRIKES.

CONVENTIONS AND ELECTIONS. The Republican party of Alabama was divided by party dissensions into two factions in 1908. The so-called "Davidson faction" held its convention at Birmingham on April 29 and chose four delegates to the National Convention. No instructions were given as to the candidate for whom these delegates should vote. Nominations for State officers were made and a new State Committee was chosen. Resolutions in regard to national affairs and the race question were avoided. The so-called "Thompson" or Administration faction held its convention at Birmingham on May 6. Resolutions were adopted endorsing President Roosevelt and J. O. Thompson and instructing the delegates for Secretary Taft. At the Democratic State primaries held on May 18th, the majority for William J. Bryan over Governor Johnson of Minnesota for endorsement for the presidency, was very large—about 25,000. Mr. Bryan therefore received the vote of the State delegation. Delegates to the National Convention were named by State primary. In the election of Nov. 3 the State vote was as follows: Bryan, 74,374; Taft, 25,305; Watson, 1565; Debs, 1347.

OTHER STATE EVENTS. On April 24, a tornado swept over the northern part of the State and two towns, Bergen, Walker County, and Albertville, Marshall County, were badly wrecked. Four persons were killed outright at Bergen and 50 were hurt. At Albertville 12 were killed and 75 injured. The total dead in the vicinity of Albertville was 26 and the total injured 165. Several were killed or injured in Blount County and there were four or five fatalities in DeKalb County. On Jan. 10, 7 persons were killed and 12 others injured when a freight train ran into a passenger train on the Alabama and Mississippi Railroad near Vinegar Bend.

LEGISLATION. Among the important measures passed by the legislative session of 1907-1908 are the following: An act was passed permitting graduates of the Law Department of the University of Alabama, upon presentation of their diplomas, and the payment of license fees, and proof of good moral character, to practise in all the courts of the State. Provision was made for a State Commission of Forestry, which shall publish annually a report upon the forest conditions of the State with reference to the preservation of forests. This Commission is to report to each session of the legislature as to the results of their investigations. The legislation bearing upon the question of the liquor traffic is noted above. Acts were passed regulating the practice of pharmacy and the sale of poisons in cities and towns of more than 900 inhabitants. The legislature also provided for the establishment of an epileptic colony. Several measures were passed affecting rail-

roads, but nothing of the importance of the legislation that was enacted in 1907, in which year Alabama probably passed more legislation affecting railroads than any other State in the same period.

STATE OFFICERS. Governor, B. B. Comer; Lieutenant-Governor, Henry B. Gray; Secretary of State, Frank N. Julian; Auditor, W. W. Brandon; Adjutant-General, Bibb Graves; Attorney-General, A. M. Garber; Treasurer, W. D. Seed; Superintendent of Education, H. C. Gunnells; Commissioner of Agriculture, J. A. Wilkinson; ex-officio Commissioner of Insurance, A. C. Sexton; Commissioner of Public Lands, Frank N. Julian—all Democrats.

JUDICIARY. Supreme Court; Chief Justice, John R. Tyson; Associate Justices, Jonathan Haralson, N. D. Denson, John C. Anderson, R. T. Simpson, James R. Dowdell, and Thomas McClellan; Clerk, R. F. Ligon, Jr.—all Democrats.

The Legislature of 1908 was composed of 35 Democrats in the Senate, and 104 Democrats, one Populist and one Republican in the House. The representatives in Congress will be found under *Congress* in the article UNITED STATES.

ALASKA. A territory of the United States, whose government is as yet unorganized, situated at the northeastern extremity of North America. The total area, according to the revised survey of 1906 is 586,400 square miles. The population, according to the best data available, was in 1908 about 31,000, distributed as follows: First Judicial Division, 9,000; Second Judicial Division, with Nome as its centre of population, 10,000; Third Judicial Division, with Fairbanks and Valdez as centres of population, 12,000. This is a liberal estimate of the permanent white population of Alaska, but does not include some six or seven thousand people of mixed nationalities, who are employed in the mines, canneries, and in railroad construction during the summer, and who leave at the close of the season of activity. The population of Alaska is engaged almost entirely in mining and railroad construction and occupations incident thereto. Near the settlements a few people are engaged in the cultivation of the soil, mainly in truck farming. The native population is approximately 35,000.

AGRICULTURE. During 1908 an agent of the Department of Agriculture conducted experiment stations with satisfactory results and established a new station near Fairbanks, where there are large areas of rolling ground. A few attempts at extensive agriculture or stock raising are made in the territory. A great variety of vegetables and plants are being cultivated with success at Manly Hot Springs near Tanana and at the Hot Springs near Nome. In 1907 the government began experimenting with Galloway cattle on Kodiak Island, and in 1908 it was reported that these experiments were meeting with success. Sheep are being raised at the same place.

FISHERIES. The total pack of the salmon canneries for 1908 was about 2,000,000 cases of four dozen one pound cans. The price of red salmon during the year was such as to insure a good profit to the canneries on the year's pack of that kind of fish. The price of pink salmon, however, was so low as to leave little if any margin to the canneries whose pack is chiefly that species of fish. The mild curing of king salmon continued during the year in southeastern Alaska. The experiments of hatching salmon fry were carried on during the year under the direction

of the United States Fish Commissioner, and some of the canneries. The law provides a rebate on the tax on canned salmon to the canneries maintaining private hatcheries. Halibut fishing continued during the year, but suffered from the low price of that fish. A few vessels were engaged in catching cod, salting them and taking them to San Francisco and Seattle for final preparation for the market. A plant for extracting oil and making guano from whales was in successful operation at Tyee, Admiralty Island during the year. The value of the fish shipped from Alaska in 1908 was as follows: salmon, canned, \$8,125,951; all other fish, \$800,165.

FURS. The quantity and quality of furs shipped from Alaska was practically the same in the fiscal year 1908 as in 1907, but the value decreased, owing to the low price which prevailed after November, 1907. The value of the furs and fur skins shipped from Alaska in 1908 was \$463,108 as compared with a value of \$648,652 in 1907.

MINING. The total value of the mineral production of Alaska for the calendar year 1908 is estimated by the United States Geological Survey at \$19,600,000 as compared with \$20,870,771 in 1907. This decrease is to be charged to the gold placers and copper mines, as most of the other mining industries of the territory show an increase in value of output. The value of the total mineral production of Alaska from 1880, when mining first began, to the close of 1908 is, in round numbers, \$148,000,000. Of this amount the gold mines produced about \$142,000,000, the silver mines about \$1,150,000 and the copper mines, \$4,100,000. The balance represents the value of the marble, gypsum, tin and coal output. Metal mining in 1908 included the operating of gold placers and lodes, and copper lode mines, together with prospecting for tin and antimony deposits. The sources of the precious metals, according to the best data available, were as follows: Siliceous ores: gold, \$3,525,000; silver, \$20,000; Copper ores: gold, \$75,000; silver, \$25,000; copper, \$634,000; Placers: gold, \$15,000,000; silver, \$35,000. There were twelve gold and silver lode mines on a productive basis in 1908 as compared with 13 in 1907, and nine copper mines made some shipments of ore as compared with 13 in 1907. It is estimated that the copper production of Alaska in 1908 was about 4,800,00 pounds as compared with 6,308,786 pounds in 1907. Of the 1908 production, something over 1,000,000 pounds is to be credited to the Prince William Sound, and the rest to the Kasaan Peninsula and the copper mining districts of Prince William Island.

Coal exists in large quantities in Alaska, and extensive fields of high grade coal have been found in the Matanuska and Bering River valleys. Owing to the difficulty in obtaining titles to the coal lands, extensive development of these fields has not yet taken place, but Congress in the 60th session approved a law by which titles to coal lands can be quickly obtained. This should insure great development in the Bering River valley where transportation is probably assured. Gypsum and marble are produced and deposits of antimony, graphite, bismuth, cinnabar and talc have been found.

TRANSPORTATION. Improved transportation facilities are among the most urgent needs of the mining industry in Alaska. Much progress was

made during 1908 in the construction of roads and trails, but these can only supplement and cannot supplant railways. The inadequacy of the river transportation lines in seasons of low water was strongly emphasized during the year by conditions that prevailed in the Yukon in the summer season. Advancement of several railroads, among which were the railways of the Matanuska coal fields and to the inland copper fields from both Valdez and Katalla, which had been actively pushed during 1907, were greatly retarded during 1908 by the unfavorable financial conditions. Rapid progress was made, however, by the railway being built up Copper River from Cordova. This line was completed to Childs Glacier in September. In connection with this road, steamers are to be run from Abercrombie Rapids, so that during 1909 it will be possible to avoid the long overland journey from the coast to reach the Chitini Copper belt. Following is a table of mileage, compiled from the best available data and prepared for the United States Geological Survey.

Mileage and terminals of Alaska railways, December 4, 1908.

Seward Peninsula:	Miles.
Seward Peninsula Ry., Nome to Shelton.....	80
Paystreak to Branch S. P. Ry.	6.5
Council City and Solomon River R. R., Council to Penelope Creek	32.5
Wild Goose Ry., Council to Ophir Creek	5
Fairbanks:	
Tanana Valley R. R. Fairbanks and Chena to Chatanika	46
Kena Peninsula:	
Alaska Central R. R., Seward to near head of Turnagain Arm	53
Copper River:	
Copper River R. R., Cordova to Childs Glacier (Sept. 17)	47
(Probably 11 miles have been built since September 17. Same railroad at Katalla, where there has also been some work done by a rival company, has built between 3 and 4 miles. At Valdez a few miles of track of the Alaska Home Ry. were laid in 1907.)	
White Pass:	
White Pass and Yukon R. R., Skagway to White Pass	20.4
(Terminal at White Horse, Yukon Territory.)	
Yakutat Bay:	
Yakutat Southern Ry., Yakutat to Situk River..	9
Portions of the Council City and Solomon River and of the Alaska Central are out of repair and not in use.	

COMMERCE. There was a slight decrease in the commerce between the United States and Alaska during the fiscal year 1908, but it was not of such character, or so large in amount as to indicate any halt in the development of the territory. Labor troubles in the placer districts caused a decrease in the output of gold and the consequent decrease in the demand for merchandise, and the sudden fall in the price of copper resulted in a material decrease of the production of this metal and in the demand for merchandise by those engaged in the copper mining. The domestic merchandise shipped from the United States to Alaska in the fiscal year ended June 30, 1908 was valued at \$15,957,576, as compared with a value in 1907 of \$17,811,093. This merchandise was divided as follows: Coal, \$182,942; lumber, \$419,170; hardware and machinery, \$4,824,509; provisions, \$5,625,681; liquors, \$733,281; all other, \$4,171,993. The value of merchandise and precious metals shipped from Alaska to the United States in the same period was \$31,766,044 as compared with a value of \$37,537,676 in 1907. This merchandise was divided as follows: Salmon, canned, \$8,125,951; all other fish, \$800,165; copper ore,

\$474,172; whalebone, \$138,989; furs and fur skins, \$463,108; all other domestic merchandise, \$915,412; gold, \$17,490,777; silver, \$13,007. In addition foreign gold was shipped to the value of \$3,337,338, and foreign silver to the value of \$7,125.

EDUCATION. The people of Alaska show great interest and take great pride in the public schools, and gratifying results were shown during the year from their operation. The schools in the incorporated towns are supported largely by the license money collected in these towns, and are under the control of the school boards and town councils. During 1908 schools were successfully maintained at the following places: Chena, Douglas, Eagle, Fairbanks, Juneau, Ketchikan, Nome, Skagway, Treadwell, Valdez, and Wrangell. In the schools established in the province by the act of Congress of Jan. 27, 1905, there were 672 pupils. The cost of maintaining these schools during the year was \$38,116. The government schools for the education of natives are under the charge of the Bureau of Education, and during 1908 these schools were increased from 52 to 62. The number of pupils increased from 2443 to 3067. A determined effort is being made by this Bureau to increase the efficiency of the schools under its control, and make them extend their influence to the parents as well as to the children. The Bureau is engaged in a determined effort to reach the physical needs of the natives through the schools which they have established and maintain, and by the employment of physicians and nurses throughout the territory. The Presbyterians, Roman Catholics, Moravians, Methodists, Baptists, Episcopalians, Friends, the Swedish Evangelical and the Orthodox Greek Churches carry on educational work, and the influence of their schools and missions is very apparent among the natives.

INDIANS. The educational work among the Indians is indicated in the paragraph above. The general condition of the Coast Indians is reported by the government of Alaska to be improving. Their physical condition, however, is not improving. Constitutional diseases are prevalent among them, and unless strong measures are taken to minimize the effect of disease and to more carefully rear the young, it will be but a short time before the natives are practically gone. Congress at its last session, provided an appropriation of \$6,000 to be used in the detection and prosecution of people engaged in selling liquor to Indians.

CABLES AND TELEGRAPHS. Excellent service is rendered to the people of Alaska by the military cable and telegraph. The cable is being extended to Cordova, the terminus of the Copper River and Northwestern Railway. Experiments for the establishment of wireless stations, undertaken during the summer of 1907, were not entirely successful, but in Sept., 1908 a wireless station was established at Circle City by the United States Signal Corps, and some successful experiments were made in receiving and transmitting wireless messages.

PUBLIC LANDS. Numerous tracts of land have been taken up under the Homestead law, approved March 3, 1903, but no extensive development of homesteads is being made. In many instances, the land taken under this act is for timber, and in some instances, to obstruct rights of way of railroads under construction. The

total number of homesteads taken up at the end of the fiscal year 1908 was 439.

POLITICS AND GOVERNMENT. A bill providing for a fourth judicial division passed the House of Representatives during the first session of the 60th Congress. The creation of this division is urgently needed. The governor in his annual report, urges the enactment into a law of that portion of the bill which provides for the change in license for the sale of intoxicating liquor in Alaska in order that the sale of all liquor may be prevented. The growing importance of shipping to Alaska calls for the better lighting and surveying of the coast. The government recommends that more lights be established and a separate lighthouse district be created for Alaska with headquarters at a suitable point in the territory. He recommends also that the natives of Alaska be given the right to acquire public land and to hold and transmit property, and he urges the enactment of some form of compulsory education law in order to secure results commensurate with the expense of the maintenance of schools for native children. The Geological, and Coast and Geodetic Surveys continued their work in Alaska during the year. In the early part of the year serious strikes took place in the Treadwell mines, and Governor Hoggatt requested aid from the Federal Government in quelling the trouble.

OFFICERS: Governor, Wilfrid B. Hoggatt; Secretary to the Governor, William H. Loller; Ex-officio Secretary to Alaska, William L. Dustin; Delegate to Congress, Thomas Cale; Delegate Elect, James Wickersham. Judiciary: First Division, Russell A. Gunnison, Judge, C. C. Page, Clerk; Second Division, Alfred S. Moore, Judge, John H. Dunn, Clerk; Third Division, Silas H. Reid, Judge, Oscar A. Wells, Clerk. The Governor is ex-officio Superintendent of Public Instruction of schools outside incorporated towns for schols maintained for children of white and mixed blood.

ALASKA YUKON PACIFIC EXPOSITION. See EXPOSITIONS.

ALBERTA. A province of Canada. Area, 253,540 square miles; population (1906), 185,412. Edmonton, the capital, had 11,167 inhabitants in 1906. For details concerning population, education, production, etc., see CANADA. The provincial government consists of the Lieutenant-Governor, appointed by the Governor-General of Canada and acting through a responsible ministry, or Executive Council, and a unicameral Legislative Assembly consisting of twenty-five members. The present Lieutenant-Governor is George H. V. Bulyea, appointed September 1, 1905. The Premier in 1908 was A. C. Rutherford.

HISTORY. The chief feature of progress during the year was the carrying into effect of a vigorous policy of railway extension, which the provincial government has assisted. With that end in view a Department of Railways was added to the government. A new license law, which was put in force on May 1, so reduced the receipts of hotels that the price of intoxicating liquors was nearly doubled and the hotel keepers sought remedial legislation. There was also considerable agitation in favor of state-owned railways, and state-ownership of interior grain elevators. The agitation for state-owned railways was based on the argument that, as under the constitution of Alberta the federal government

retained control of the provincial lands, it should build the new railways.

ALBERTI, PETER A., Former Danish Minister of Justice, who while holding that office is said to have made away with about \$5,000,000 of the funds of companies in which he was interested. He was born on the Island of Zealand, was educated at the University of Copenhagen, was called to the bar at the age of twenty-one and was admitted to the Supreme Court at the age of twenty-five. Ten years afterward he became manager of the Zealand Peasants' Savings Bank, and subsequently he established the Zealand Fire Insurance Company, and the Danish Farmers' Syndicate, all of which institutions he conducted at first with signal ability. He was elected to the Danish Parliament at the age of forty, became a conspicuous member of the Radical party, and was made Minister of Justice in the first Liberal Ministry formed in Denmark. This position he used to advance his own commercial interests while ostensibly developing the companies of which he was the controlling director. This involved the falsification of books, and a series of colossal peculations. In one instance he borrowed from the government for the Zealand Savings Bank \$500,000 all of which he is believed to have appropriated to his own uses. He resigned from the cabinet in July, 1908, avowedly in order to devote all of his time to his business enterprises, but on September 8, was arrested on a charge of forgery. See DENMARK.

ALCOHOL. The question as to the harmfulness of moderate amounts of alcohol was debated with considerable fervor during 1908. The influence of alcohol in the military service was investigated by Lt. Colonel Davies of the British Army. His conclusion is that, in the ordinary healthy man, alcohol is unnecessary under any circumstances that may arise in military service, even those conditions in which it is usually held to be desirable: *e. g.* after exposure to extremes of heat and cold, excessive bodily or mental labor, or the fatigues incident to active service. Davies next considered whether alcoholic beverages in moderate amounts as used by ordinary healthy men are harmful or the reverse, and whether their use should be encouraged, prohibited, regulated or let alone. In this connection he adduces statistics referring to the comparative healthiness of abstainers and non-abstainers obtained from these two classes of membership in the United Kingdom Temperance and General Provident Institution for sixty years. These figures go to show that even moderate quantities of alcohol such as would naturally be used by those insured in this society tend to diminish the expectation of life. Becker conducted researches among persons habituated to constant moderate amounts of alcohol daily. He could not obtain these conditions in the young, and therefore restricted his inquiry to persons 90 years old or over. The sexes were about equally divided, and the cases were from all ranks of society. The average consumption of alcohol was about one-half ounce daily per capita among these selected individuals all of whom were hale and hearty for their time of life. Becker therefore accepts this as the maximal safe daily dose. This may be compared with the opinions of 40 years ago, exemplified in Anstie's rule concerning the use of alcohol, first enunciated by Dr. Francis Ed-

mund Anstic, a London physician, in a monograph, *The Uses of Wine in Health and Disease*, published in 1870. Briefly it is to the effect that the maximum amount of absolute alcohol which can be taken by an adult without injury is one and a half ounces daily. This is equivalent to about three ounces of whiskey, brandy, gin or rum, about four wineglassfuls of sherry or other heavy wine, to one pint of claret, champagne or other light wine, to three glasses of strong ale or porter, or five glasses of beer or light ale. The mortality from alcohol in the Paris hospitals and asylums has been the subject of investigation by C. Fernet for several years. He finds that in insane asylums alcohol was directly or indirectly responsible for about half and in the general hospitals for about a third of the deaths.

It is stated by Ferris of the New York State Commission in Lunacy that of the ascertainable causes of the 6200 new cases of insanity annually admitted into the New York State Hospitals, the use of alcoholic beverages was the direct cause of the lunacy in 19.8 per cent., and a known contributing cause in 4.7 per cent. additional; total, 24.5 per cent.

Copp of Massachusetts ascribes alcoholic intemperance as the cause of 16.65 per cent. of 1676 new admissions of insane patients, and states that it was the predisposing cause in 5.35 per cent. additional, or 22 per cent. in all.

ALDEN, WILLIAM LIVINGSTON. An American author and journalist, died in Buffalo, N. Y., on January 14, 1908. He was born in Williamstown, Mass., on October 9, 1837, a lineal descendant of John and Priscilla Alden; graduated at Jefferson College in 1858, was admitted to the New York bar in 1860, and practiced until 1865. In the latter year he joined the staff of the *New York Times* for which, and for the *New York World*, *Graphic* and other papers, he wrote editorials until 1885. In 1885-89 he was United States Consul General at Rome, where he received from King Humbert the decoration of Knight of the Crown of Italy. He was on the staff of the Paris edition of the *New York Herald* in 1890-93, after which, until shortly before his death, he lived in London, where he was literary correspondent of the *New York Times*, and was well known. His many books, some of which were quite popular, include: *Domestic Explosions* (1878); *Shooting Stars* (1879); *Cruise of the Canoe Club* (1883); *The Mystery of Elias G. Roebuck* (1896); *His Daughter* (1897); *Dreobitt's Dream* (1902); *New Robinson Crusoe* (1903); *Cat's Tales* (1905), and *Jimmy Brown Trying to Find Europe* (1905).

ALDRICH, NELSON WILMARTH. An American legislator, United States Senator (Republican), from Rhode Island. He was born at Foster, R. I., on November 6, 1841, was educated in the public schools and at the East Greenwich Academy and became engaged in wholesale business. From 1871 to 1873 he was president of the Providence Common Council, and in 1875 and 1876 represented his district in the lower house of the State legislature, having been chosen speaker in the last-named year. In 1878 he was elected representative to Congress, and he served in that body until 1881, when he resigned to become United States Senator. He has since served continuously in the Senate, having been reelected for the fourth

time in 1904. Senator Aldrich is the Republican leader of the Senate and has for several years been chairman of the Committee on Finance. In January, 1908, he introduced the currency bill, which, in its compromise form and known as the Aldrich-Vreeland bill, was approved on May 30, 1908. See UNITED STATES, section on Congress; CURRENCY.

ALEXIS, ALEXANDROVITCH. A Russian Grand Duke and the fourth son of Alexander II., died in Paris, on November 14, 1908. He was born on January 14, 1850. As Grand Admiral of the Russian fleet, he took an active part in the reorganization of the navy during Alexander's reign, and had much to do with the buying of ships for the volunteer fleet. For the disastrous defeat of the Russian fleet in the Battle of the Sea of Japan, he was held partly accountable, with the result that he asked to be relieved of his command, and soon afterward made his permanent home in Paris. The Grand Duke visited the United States in 1872, and was very cordially received.

ALFALFA. In the production of the total hay yield for 1908 alfalfa, especially in the Western States where it did unusually well, proved a very important factor. The average yield of alfalfa hay was estimated at 2.5 tons per acre, and according to the United States Department of Agriculture, the yield of 1908 represented 90.7% of a full crop as compared with 89.8% of a full crop in 1907. It was believed that the acreage of alfalfa has more than doubled during the past 10 years and that in 1908 over 4,000,000 acres were devoted to this crop. In Kansas alone the increase in acreage since 1899 was estimated as 500,000 acres and that over 700,000 acres were now grown within the state.

In various sections the hay grasses such as timothy suffered much from drouth but the alfalfa crop owing to its deeper growing root system was better able to cope with these conditions and consequently the reduction in yield was not so marked. Alfalfa was fast making its way into Eastern and Southern sections. Farmers and feeders everywhere were beginning to realize its value on account of the good prices secured for hay generally and because of the need of feeds richer in protein than hay made from the grasses or corn fodder and other forms of roughage. In protein production alfalfa leads most hay crops, even the cowpea and red clover, although here the difference is not so great as when compared with the grasses. On a protein basis alfalfa hay is worth about three times as much as prairie hay and from six to eight times as much as timothy hay. The Colorado experiment station determined that alfalfa produced approximately 2000 pounds of digestible dry matter, 900 pounds of digestible protein, and 925 pounds of digestible starch and sugar more per acre than corn. While alfalfa is recognized as an important land improver, it is also true that it uses large quantities of potash which sooner or later must be replaced. Investigators determined that an acre crop removed from the soil about 200 pounds of potash, 60 pounds of phosphates, and 90 pounds of lime and this fact accounted for the beneficial effects generally when these substances are applied to the crop. The difficulties in obtaining a stand of alfalfa are overcome in the same measure as farmers realize the necessity of soil inocula-

tion and thorough soil preparation. The seed bed for alfalfa cannot be prepared too well. It was reported from the State of Washington that the practice of sowing from 10 to 15 pounds of orchard grass seed with 10 pounds of alfalfa seed has been found to give excellent pasture and to prevent bloat in the grazing animals. To grow crops together with alfalfa on the same ground, however, is not always desirable. The Arizona Experiment Station in some of its recent work found that nurse crops of rye, wheat, barley and oats all retarded the development of the roots as well as the stems of the alfalfa plants. Progress in securing pure seed was made during the year by the Experiment Station at Geneva, N. Y., which worked out a method of screening alfalfa seed to free it from fodder seeds, and the United States Department of Agriculture perfected a method of removing buckhorn seed from alfalfa seed. The experiment stations also inaugurated work in breeding alfalfa for either seed or forage production.

ALGERIA. A French colony in North Africa, consisting of Algeria proper and the Southern Territory, the latter having been formed out of portions of Algeria and the Sahara. Algeria proper has an area of 77,208 square miles and a population (1906) of 4,785,759, including 718,984 Europeans. The Southern Territory has an area of 316,629 square miles and (1906) 446,091 inhabitants, including 10,976 Europeans. The natives are all Mohammedans. The Jews, numbering 57,132 in 1901, are French citizens. The principal towns, with their populations in 1906, are as follows (the communal populations being indicated in parentheses): Algiers, the capital and chief seaport, 138,240 (154,049); Oran, 100,499 (106,517); Constantine, 46,806 (58,435); Bone, 36,004 (42,934); Sidi-bel-Abbes, 24,494 (29,088); Tlemcen, 24,060 (39,757); Mostaganem, 19,528 (22,011).

PRODUCTION. In 1907 the area under wheat was 3,257,377 acres (1908: 3,387,858), and its production, 31,260,809 bushels; barley, 3,168,555 acres (1908: 3,208,275) and 41,543,231 bushels; oats, 340,658 acres (1908: 334,768) and 10,651,274 bushels. Other important crops are maize, (1906: 400,000 bushels) beans, and dari. The production of olive oil in 1906-7 was 10,400 metric tons; of wine in 1907, 227,072,400 gallons. In 1907 experiments in cotton cultivation were continued under the auspices of the Colonial Cotton Association; the production was 35,053 pounds, against 3,832 in 1906. Tobacco is cultivated, as well as peas, potatoes, artichokes, tomatoes etc. There are numerous fig, date, orange, lemon, mandarine, and almond trees. The soap tree is successfully cultivated. The forests contain numerous cork trees. In 1905 there were 1,066,404 cattle, 221,140 horses, 174,234 mules, 277,523 asses, 199,715 camels, 9,062,636 sheep, 4,030,208 goats, and 91,267 pigs. The fisheries yield tunny-fish, sardines, anchovies, sprats, shell-fish, etc. In 1908 rich banks of coral were discovered at Mansouriah and Azianra, at a depth of 150 feet. About 218 pounds of coral were collected, and the search for it was to be undertaken on a large scale. In 1906 there were worked 44 mines for iron, zinc, silver, lead, mercury, copper, antimony, and coal, the total output being valued at 20,257,147 francs. The phosphate deposits yield about 6,500,000 francs worth annually. Petro-

leum has been found in the department of Oran, and lignite deposits several feet thick were found in 1908 in the Souk-Ahras district, at Oued-Mouyras.

COMMERCE AND COMMUNICATIONS. In 1906 imports and exports (special trade) amounted to 401,652,000 and 280,295,000 francs respectively, against 383,900,000 and 228,800,000 respectively in 1905. In the general commerce of 1907 imports were valued at 461,000,000 and exports at 359,000,000 francs. The principal imports are textiles, clothing, leather goods, metal goods, machinery, casks, butter, cheese, sugar, coffee, and timber. The principal exports in 1906, in francs, were: Wine, 51,486,000; cereals, 47,158,000; living animals, 28,179,000; wool, 18,286,000; cork, 15,594,000; hides and skins, 11,212,000; zinc, 11,157,000; fruits, 10,666,000; iron ore, 9,518,000; phosphates, 9,053,000; olive oil, 7,484,000; alfa, 7,297,000; tobacco, 6,645,000, besides vegetable hair, legumes, fish, potatoes, lead, tanning bark, etc. The imports from France amounted to 340,341,000 francs in 1906 and 392,700,000 in 1907; exports to France, 202,353,000 in 1906 and 290,600,000 in 1907. The other leading countries in the foreign trade are Belgium, Germany, Great Britain, Spain, Italy, Brazil, and French colonies. The tonnage entered in 1906 was 3,956,291 (2,231,299 French) and cleared, 4,038,616 (2,295,154 French). The merchant marine at the beginning of 1907 consisted of 804 vessels of 10,134 tons. The length of railway on Dec. 31, 1906, was 1968 miles; of telegraph lines, 8920 miles. The railways receive an annual subvention amounting to between 14,000,000 and 15,000,000 francs.

GOVERNMENT AND FINANCE. The whole of Algeria is under a Governor-General, but its two divisions have separate administrations and budgets. A part of the Southern Territory is still under military rule. The laws for Algeria are made by the French National Assembly, in which each of the three departments (Algiers, Oran, and Constantine) of Algeria proper is represented by one senator and two deputies.

The budget is prepared by the Governor-General with the advice and consent of the Superior Council, composed of high officials and delegates from the departmental councils, and the three delegations, representing respectively the natives, the French colonists, and the French taxpayers other than colonists. The budget for 1908 estimated the revenue and expenditure of Algeria proper at 108,592,201 and 99,090,203 francs respectively; of the Southern Territory, at 3,345,745 and 3,243,665. The debt stood at the end of 1905 at 168,559,719 francs. The cost of the army, which numbers over 56,000, is borne by the French budget. The Governor-General in 1908 was M. Jonnart.

HISTORY. By the law of Feb. 28, 1908, the French Parliament authorized Algeria to contract a loan of 175,000,000 francs, a great part of which was to be devoted to public works. In so doing, the Chamber expressed its desire that the Algerian budget should provide the necessary funds for schools, and that schools should be established sufficient for the teaching of 120,000 children. This aroused some criticism in the colony, as an interference in native affairs. Moreover, the opinion of the colonists was not in favor of increasing schools, but rather in favor of closing some that now exist. Owing to the concili-

atory attitude of the Financial Delegations, and the moral influence of the Governor-General, the matter was satisfactorily settled, the Delegations agreeing to set apart for this purpose 520,000 francs each year for ten years. It was urged by the colonists against this policy of extending the school system among the natives, that it might lead to the forming of a half-educated, discontented class who would turn their instruction to account against their rulers, and on this point, the educated natives of British India were cited as a warning. Then it was said that the policy would tend to withdraw the mass of people from their old influences, without fitting them for the new, detach them from the soil, and deprive them of their taste for work. The educational programme tried to avoid these dangers by offering as practical an education as possible, having in view the fitting of pupils for certain trades or professions. It required, however, the teaching of French in the primary schools, and this was criticised as unlikely to lead to any real knowledge of the language and as tending to confuse the minds of the children and waste their time.

THE OUEENZA AFFAIR. A question of importance as to the economic future of Algeria arose from some mining concessions at Ouenza in the province of Constantine near the border of Tunis, and about 135 miles from the port of Bône. Several years before, a deposit of iron had been discovered, whose yield, according to experts, promised to be one of the richest in the world. Its working would, in their opinion, tend to break the practical monopoly which was held by the Swedish mines. Through an error, the government had granted two concessions, one for surface mining and the other for mining proper, and as a result, litigation ensued for several years between the concessionaries, thus preventing any exploitation of the mines. Finally, the concessionary company to which the rights of mining underground had been given, agreed to complete, at its own expense, a railway connecting the mine with the port of Bône, from which the ore would be shipped. By accepting this offer, the government would obtain, without expense, a railroad valued at 14,000,000 francs, to say nothing of the opening of a new region, the increased commerce of Bône, the impetus that the new line would give to trade and to the demand for labor, and the annual income of a million francs as rent for the line. M. Jonnart, the Governor-General, succeeded in effecting an arrangement between the contesting concessionaries and only the consent of Parliament was now necessary for its conclusion. This, however, was opposed, the chief speakers against it being the Socialists, MM. Zévaès and Jaurès. The main argument that they employed was the danger of permitting foreign capital to exploit the mine. In the group of capitalists interested in the project, there were Belgians, Germans, Italians and English, as well as French. The Socialist opponents of the measure dwelt at length on the dangers of international capitalism. Its defenders urged the fact that the council in control of the company would contain a majority of Frenchmen, and emphasized the great advantage that the working of the mines would have for Algeria in particular, and for iron manufacturers in general by breaking the Swedish monopoly. The arguments against the measure

prevailed, however, and the consent of Parliament was withheld.

BORDER FIGHTING. The conflict between the French and Mulai Hafid in Morocco (q. v.) affected the situation on the Algerian border. Moorish emissaries stirred up some unrest among the South Algerian tribes while an invasion by Moorish tribesmen on the north-western frontier in the summer led to a sharp battle with French troops, in which the invaders were routed with heavy loss but not before they had seriously threatened the French position for a time. In December there was a short mutiny among the soldiers of the Foreign Legion which the French were inclined to attribute to German machinations. On the whole, however, the government's confidence in the loyalty of the Algerian natives has remained unshaken. This was shown in the spring of 1908, when a plan was brought forward for withdrawing the greater part of the French army of occupation from the country, its place to be taken by two or three army corps raised among the natives and made liable for service in Europe in case of necessity.

ALI MIRZA. Shah of Persia. See PERSIA.

ALLEN, ALEXANDER VIETS GRISWOLD. An American Episcopalian minister and theological writer, died on July 1, 1908. He was born in Otis, Mass., on May 4, 1841. He graduated at Kenyon College in 1862, and at Andover Theological Seminary in 1865, when he was ordained as priest in the Protestant Episcopal Church and installed as rector of St. John's Church, in Lawrence, Mass. In 1867 he was appointed professor of church history at the Episcopal Theological School, Cambridge, Mass. He occupied this chair for the remainder of his life. He wrote numerous theological and biographical works, including a *Life of Jonathan Edwards* (1889); *Religious Progress* (1894); and *Life and Letters of Phillips Brooks* (2 vol., 1901). His last book, *Freedom in the Church*, (1907), was written in defense of his friend Dr. Algernon S. Crapey.

ALLISON, WILLIAM BOYD. United States Senator from Iowa, who had the remarkable record of having been a member of Congress for forty-three years, and for several years "father of the Senate," of which he had been a member since 1873, died at his home in Dubuque, Iowa, on August 4, 1908. He was born in Perry Township, Wayne County, Ohio, the son of a farmer; attended the district school, and a private school in Wooster, Ohio, and then studied for a year at Allegheny College, Meadville, Pa., and for another year at the Western Reserve University. He then studied law, in Wooster, and in 1851 was admitted to the bar in Ashland, where he practiced for several years. He was a delegate to the Republican State convention which nominated Salmon P. Chase for governor of Ohio in 1856, and supported John C. Frémont in the presidential campaign that year. In 1857 he established himself in Dubuque, where he became a member of a law firm; in 1859 he was a member of the Republican State convention and voted for the nomination of Samuel J. Kirkwood. As assistant secretary of the Chicago convention of 1860, he called the roll of States when Lincoln was nominated for president. At the beginning of the Civil War, he became a member of Governor

Kirkwood's staff, and rendered very valuable services in enlisting and equipping Iowa volunteers. Mr Allison was elected a representative from Iowa in the Thirty-eighth Congress, took his seat on December 7, 1863, and served four successive terms—until March 3, 1871. During this period he formed lasting personal friendships with James G. Blaine and James A. Garfield. During his second term, as a member of the Committee on Ways and Means, he began his study of national financial policies, which he continued during the remainder of his career. At the end of his fourth term in the House he declined a renomination, but on December, 1873 he took his seat in the United States Senate, a post which he continued to hold during the remainder of his life. By the primaries of June, 1908, he had been renominated, and if he had been reelected and had completed his term, his period of continuous service would have been longer than that of any other senator, since the establishment of the national government.

An exceedingly cautious, painstaking and thorough man, Senator Allison either initiated, or had an important part in shaping most of the financial legislation during his long service in Congress. He had been a member of the Senate Committee on Finance for thirty years, and chairman of the Committee on Appropriations for twenty-five years. He was on the special committee which drew up the bill for the resumption of specie payments in 1875. In 1878, after the Bland bill had passed the House by more than two-thirds majority, he brought about its emasculation in the Senate by means of an amendment (afterward concurred in by the House), substituting for the free coinage of silver at the ratio of 16 to 1 the provision that the Government should buy bullion at its market price, coin it into dollars and use these dollars in the payment of the national debt, or in the buying of more bullion. Another clause of this amendment authorized the President to call an international monetary conference—the Paris conference of 1878. Senator Allison was a member of the sub-committee which drew up the Senate amendments to the McKinley Tariff bill in 1890, and he introduced the amendment to the Civil Service Bill (1883) by which the independence of the Commission was insured. Of his service in the Senate, George F. Hoar, the distinguished Senator from Massachusetts, said: "During all that time he has done what no other man in the country, in my judgment, could have done so well. . . . He has controlled more than any other man, indeed more than any other ten men, the vast and constantly increasing public expenditure, now amounting to more than 1,000 millions annually. It has been an economical, honest and wise expenditure. He has been compelled in the discharge of his duties to understand the complications and mechanism of public administration and public expenditure. That is a knowledge in which nobody else in the Senate, except Senator Hale of Maine, and Senator Cockrell of Missouri, can compare with him. He has by his wise and moderate counsel drawn the fire from many a wild and dangerous scheme which menaced the public peace and safety." (Hoar, *Autobiography of Seventy Years*, New York, 1903.) As to the criticism of Senator Allison that he was "very careful not to offend anybody," and that he was "unwilling to take re-

sponsibility, or to commit himself," Senator Hoar remarked that if Allison's attitude were otherwise "he would find it very hard to maintain the personal influence necessary to success in the duties to which he is immediately devoted," Senator Allison's ingrained conservatism led him bitterly and persistently to oppose the Iowa "radical" Republican faction led in 1908 by Governor Albert B. Cummins (q. v.).

ALL RED ROUTE. See CANADA.

ALUMINUM. The year 1908 was important in the aluminum industry for the expiration of an agreement among the European producers, so that with large stocks on hand competition developed and the price fell to 13 1/2 and 14 cents a pound, with the result that in Europe aluminum could be purchased pound for pound at less cost than copper. This was significant in that for the first time aluminum, the world's production of which in 1907 amounted to 32,500 metric tons, became a commercial metal, subject to competitive manufacture and sale just as iron, copper, lead etc. In the United States the consumption of aluminum as reported by the U. S. Geological Survey during 1907 was 17,211,000 pounds, valued at \$4,926,948, as against 14,910,000 pounds, valued at \$4,262,286, in 1906. The change in European conditions during 1908 had its corresponding effect in America as aluminum is produced in the United States by a single producer which aided by a tariff duty of 8 cents per pound was able to maintain a price of 33 cents until Oct. 1. Successive reductions down to 24 cents were made, but foreign aluminum was in the market as low as 22 cents. In 1907 the price ranged from 36 cents in January to 38 cents in December reaching a maximum of 50 cents in April.

AMERICAN ASSOCIATIONS AND SOCIETIES. The associations and societies whose official titles begin with the word American will be found under the names of subjects in which such organizations are interested. For example, for the American Academy of Political and Social Science, see POLITICAL AND SOCIAL SCIENCE, AMERICAN ACADEMY OF.

AMHERST COLLEGE, an institution of higher learning at Amherst, Mass., founded in 1821. In 1907-8 the attendance was 510, an increase of .35 over the previous year. At the beginning of 1908-9, it was 528, the largest registration in the history of the college. New biological and geological laboratories were brought nearly to completion in 1908 and will be occupied in 1909. The college will then have complete scientific equipment with extensive physical and chemical laboratories and a new observatory. Scholarships are awarded on the basis of academic standing. The productive funds in 1908 were \$2,000,000 and the income of the college is \$130,000. The faculty consists of 45 members. The President is Rev. Dr. George Harris.

AMICIS, EDMONDO DE. One of the most gifted and popular of contemporary Italian writers, died on March 11, 1908. He was born in Oneglia, Liguria, on October 21, 1846, graduated at the Military Academy at Modena in 1861, and served for several years in the Italian army, taking part in the battle of Custoza in 1866. He edited for a short time *L'Italia Militare*, at Florence, but upon the occupation of Rome by the Italian troops (1870), he retired from this position and from the army,

and thereafter devoted himself entirely to writing, his volume of military sketches, *Bozzetti della vita militare* (1868) having already proved very popular. He travelled in England, Holland, Spain, Africa, Turkey and South America, and his books wherein he describes these journeys, reveal not only keen observation but much kindly humor, a sympathetic view-point, broad tolerance, and a talent for vivid description. Such volumes include *Constantinople*, translated by Caroline Tilton (1878); *Studies in Paris*, translated by W. W. Cady (1879); *Spain and the Spaniards*, translated by W. W. Cady (1881); *Holland and Its People*, translated by Caroline Tilton (1881); and *Morocco and Its People*, translated by C. Rollin-Tilton (1882). He is best known, however, through a single book on child life, *Cuore, an Italian Schoolboy's Diary*, translated by Isabel F. Hapgood (1887-95), which was very widely read, and warmly praised not only in Europe but in America. On educational themes de Amicis wrote *La maestrina degli opera* (1895), and *Il romanzo d'un maestro* (1895), the last named suggesting his socialistic sympathies which become more and more strongly marked in his later works, notably in his pamphlet *Ai Nemici del Socialismo* (1896). His other works include the *Novelle* (1872); the historical tales, *Alle porte d'Italia* (1884); and *La carrozza di tutti* (1899); *Memorie* (1899); *Speranza e loria* (1900), and *Ricordi d'infanzia et di scuola* (1901.)

ANÆSTHESIA. SPINAL ANÆSTHESIA was frequently used in Europe in 1908. Though invented by Corning, of New York, American surgeons have never taken kindly to this method, which consists of injecting solutions of cocaine, storain, alypin or other derivatives of coca, into the spinal canal, after removing a corresponding amount of spinal fluid. The method was designed for operations on the lower part of the body, in patients unable to take a general anæsthetic. The results of several years' trial, however, seem to doom this procedure to ultimate abandonment, owing not only to the high percentage of evil after-effects, but also to the mortality, and to the added fact that in a considerable number of cases anæsthesia was not induced. The subject was reviewed at a meeting of the Paris Surgical Society in March. Besides a number of fatalities there were reported the following unfortunate by- and after-effects: Collapse, syncope, temporary paralysis of the lower extremities, oculo-motor paralysis, complete paralysis of arms, legs, and back of neck, pain and other sensory disturbances, loss of control over the bladder and the bowels. Death occurred in some patients from softening of the brain, as long as a year after operation. Other cases of death occurred from cerebrospinal meningitis. Headache, vomiting and other minor symptoms were present in at least twenty per cent. of the cases. Altogether the accumulated experience of several years will lead to careful selection of cases and the employment of the method only in hospitals where every safeguard against ill results is at hand.

SCOPOLMINE ANALGESIA. Scopolamine, an alkaloid of hyoscyamus, in combination with morphine, has had extensive use during 1908, for the easing of labor pains and as a preparation for general anæsthesia. The substance is injected hypodermatically. Testimony as to its value is conflicting. Certain writers report a high per-

centage of painless labors; in the experience of others the drug has often failed of the desired effect and produced undesirable sequale. Bertino of Florence reports 400 obstetric cases treated in Professor Resinelli's clinic. His conclusions are that the method is not without danger to the child, that the drug is unreliable, no action being obtained in thirty-six per cent. of the cases, and that although pains are lessened, regular uterine contractions were interfered with. In thirty-eight cases labor was suspended or retrogressed. In a considerable number of women labor was arrested for periods from a few hours to several days. Dangers to the infant were manifested during the first few hours after birth, by undue somnolence, torpidity, cyanosis, shallow respiration and asphyxia. Two fatalities in infants could be directly traced to scopolamine. It will be seen that the percentage of abnormal phenomena both in mother and child make the method undesirable. In seventy women visual disturbances, mental confusion, hallucinations and sub-delirium occurred.

LOCAL ANÆSTHESIA. A novel method of obtaining local anæsthesia by transfusion was practised by Bier. The technic is as follows: The blood is carefully expelled from the selected extremity by bandaging. Then above the operative field of operation. A subcutaneous vein is opened elastic band wound many times about the limb. A second elastic bandage is applied below the field of operation. A subcutaneous vein is opened and a weak solution of the anæsthetic injected. Anæsthesia follows in from two to fifteen minutes. This procedure is painless, and extensive operations upon the limbs, such as resection of joints and tendon transplantation, can be performed. The anæsthetic is confined to the operative area by suspension of the circulation.

ANAPHYLAXIS. See ANTITOXIN.

ANARCHY. The outbreaks of violence, including the murder of Father Leo Heinrich in Denver (see COLORADO); the attempted assassination of the Chief of Police of Chicago (see ILLINOIS), and the throwing of a bomb in New York, caused by avowed or suspected anarchists, inspired the government to resort to drastic measures for dealing with those who inspired such outrages. On March 3, Oscar S. Straus, Secretary of Commerce and Labor, issued a circular letter of instruction to the commissioners of immigration and immigrant inspectors in charge, directing them to inform police officials in their respective cities of the Federal laws relating to anarchists and persons of excluded classes, and to obtain the coöperation of these officials "in an effort to rid the country of alien anarchists and criminals." On March 23, the Postmaster General issued an order, excluding from the mails the Anarchist weekly paper, *La Questione Sociale*, published at Paterson, New Jersey. This action was taken at the direction of President Roosevelt in response to a letter sent by the Mayor of Paterson to the President, asking his aid in the effort being made to rid Paterson of anarchists, and especially calling his attention to this publication. This newspaper, it was alleged, advocated murder by dynamite and specifically urged the murder of enlisted men in the United States Army, officers of the police force, and the burning of houses of private citizens. On April 9, President Roosevelt sent a special message to Congress demanding new legislation on the subject

of anarchy. He urged further legislation by Congress in the matter of preventing periodicals which advocate violence from circulating in the mails. He said: "When compared to the suppression of anarchy, every other question sinks into insignificance. The anarchist is the enemy of humanity, the enemy of all mankind, and his is a deeper degree of criminality than any other. No emigrant is allowed to come to our shores, if he is an anarchist; and no paper, published here or abroad, should be permitted circulation in this country if it propagates anarchistic opinions." Measures were passed by Congress in line with the President's recommendation.

ANDREW AND PHILIP, BROTHERHOOD or. A religious organization, interdenominational in character, founded in 1888. Its members are included in twenty-four evangelical denominations in the United States as follows: The Reformed Church in America, the Reformed Church in the United States, Congregational, Presbyterian, Protestant Episcopal, Methodist Protestant, Baptist, Free Baptist, United Brethren, Lutheran Reformed Episcopal, Church of Christ, Aggressive Brethren, Friends, United Evangelical, Free and African Methodist Episcopal, and Evangelical Associations. It has branches in Australia, Japan, China, England, and Canada. Its object is the propagation of the gospel by the active support of its work. This organization since its foundation has 1100 chapters, enrolling 4500 men and 89 boys' chapters, with 1870 members. The President is Rev. Rufus W. Miller, D. D., and the General Secretary, Rev. William H. Pheley.

ANGLICAN CHURCH. The collective name given to that group of autonomous churches, which are in communion with or have sprung from the Church of England. They include the following: The Church of Ireland; the Episcopal Church of Scotland; the Protestant Episcopal Church of the United States of America; the Church of Canada; the Church of Australia; the Indian Church, and the Church of South Africa. In addition to these autonomous churches, there are in connection with the Anglican communion 28 missionary bishops representing the English Church in various remote regions of Asia, Africa, and America; 10 representing the Protestant Episcopal Church of America, the Reformed Episcopal Church of America and the Free Church of England, which are not recognized as authentic branches of the Anglican Church. See ENGLAND, CHURCH OF.

ANGOLA. A Portuguese colony in West Africa. Area (including Kabinda, to the north of the Congo), over 490,000 square miles; population, about 3,800,000. The principal towns are Loanda, the capital; Benguela, Novo Redondo, Ambriz, Kabinda, Mossamedes, and Port Alexander. The chief products are coffee, rubber, sugar, wax, vegetable oils, cocoanuts, ivory, cattle, and fish. The rubber supplies of the coast region are becoming exhausted, but immense rubber-producing areas exist inland, which await the development of means of transportation for their exploitation. The defective mode of preparation of Angola rubber caused its value in the European markets to drop to an alarming extent, and the question of proper preparation was being seriously considered by the Governor-General. Experiments were made on a government plantation, resulting in a small quantity of

rubber which obtained nearly twice the price previously paid. Para and Ceara rubber seeds were distributed to the local planters, with successful results. The export of rubber in 1905-6 was 1250 tons. Coffee production was declining, owing to low price, lack of labor, difficulty of transport, and the heavy export duty. The exportation of the produce of all fibre-producing plants was being encouraged by the government. A trial shipment of kapok was made to Great Britain. This fibre is abundant in various districts, but at present the scarcity of labor and the difficulty of preparation stand in the way of its immediate success as an export product. A few years before an attempt had been made to work up an export trade in the fibre of the baobab tree (*Adansonia*), which obtained a price of \$30 a ton in Europe, but the attempt failed owing to heavy steamer and railway charges and customs duties. The export of cotton was on the increase. The government supplied the planters with American and Egyptian seed, and issued from its press a Portuguese translation of the *A. B. C. of Cotton Growing*. The government also established an experimental station near the river Bengo, where experiments were being made in planting, ginning, and in the preparation of oil cake from the seed. The hut tax is payable by the natives in cotton. The principal cotton growing district is served by the railway, and the river Bengo is to be made navigable to the sea. The sugar industry was declining, owing to the prohibition of the sale of rum to the natives in accordance with the Brussels Liquor Convention of 1906. The planters used to make their chief profits from the preparation of rum. Some tobacco is grown and consumed locally. Petroleum and asphalt deposits are worked by a British company. Some gold has been found, and copper, iron, petroleum, salt, and malachite are reported to exist in large quantities. Textiles and coal are the principal imports, and coffee and rubber the principal exports. In 1907 the imports were valued at \$6,671,000, and the exports at \$4,322,000. The coasting and transit trade amounted to \$1,425,000. About half the imports are from Great Britain. The colony is visited by Portuguese, British, and German steamships. The length of railway in 1908 was over 390 miles. The railway from the port of Loanda to Ambaka, 226 miles, was being extended to Melange. Of the line from the port of Mossamedes to Chella, 42 miles were reported completed at the beginning of 1908. A line was being constructed from Lobito Bay, near Benguela, to the rich mineral field of Katanga, in the Congo Free State (q. v.). Its ultimate length is to be 1,200 miles, linking it with the railway system of the Transvaal, Orange River Colony, and Rhodesia. (See CONGO FREE STATE.) By Oct., 1908, rails were laid to Katengue, 76 miles from Lobito and across the dry zone, while grading at the end of 1907 was completed to 100 miles. After the dry zone had been crossed there was no difficulty in obtaining local labor, while contingents were also imported from Senegal, and over 2,000 Indian coolies from Natal. The 143 miles constituting the present contract was to have been completed by April, 1909. A lighthouse 575 feet from the end of Lobito Spit, near Lobito, was to have been completed by the end of May, 1908. The length of telegraph lines in the colony was about 1860 miles. The Governor-General resides at Loanda. The colony

is divided into six districts. The budget for 1907-8 estimated the revenue at 2,269,105 and the expenditure at 3,325,067 milreis (1 milreis = \$1.08.)

ANIMAL DISEASES. See **VETERINARY SCIENCE.**

ANKENY, DEVI. United States senator from Washington. He was born at St. Joseph, Mo., on Aug. 1, 1844. His parents went to Oregon in 1850, and he was educated in the public schools of Portland. He was chairman of the Pan-American Commission from Washington, and was an unsuccessful candidate for the United States Senate from that State in 1895 and 1899. In 1903, however, he was elected senator for the term ending in 1909. He was a candidate for re-election in 1908, the election being conducted under the direct primary law for the first time, but was defeated by Wesley L. Jones, after a bitter contest in which Senator Ankeny was charged by the leading newspapers with having bought his first election to the Senate. See **WASHINGTON; PRIMARIES, DIRECT.**

ANNAM. A French protectorate in Indo-China. Area, about 52,100 square miles; population (1906) \$5,565,597, including a few thousand Chinese and a few hundred Europeans. There are 420,000 Roman Catholics. Hué, the capital, has 50,000 inhabitants; Bin-Dinh, 73,306. The minerals include coal, of which some 25,000 tons are mined annually; iron, worked in primitive furnaces; copper, zinc, gold, and salt. The agricultural products are rice, maize, betel-nuts, sugar, coffee, tobacco, manoc, cinnamon, etc. Cotton of inferior quality is cultivated in the district of Than-Hoa, in the north. Some 700,000 pounds of raw silk are produced annually, two-thirds of it being used in native manufactures. Silk-weaving is on the increase. Silk crêpes are made at Quinhon, on the coast. Cattle-raising is of importance; the number of cattle is reported to be 1,250,000. The forests furnish timber, medicinal and dye plants, and rubber. The imports and exports are included in those of French Indo-China (q. v.). Internal affairs are administered by native officials under the control of the French Superior Resident. Duy Tan, born in 1899, son of King Than Thai, became King on Sept. 9, 1907. The local budget for 1908 balanced at 2,915,000 dollars (1 dollar = about 4* cents.) See **FRENCH INDO-CHINA.**

ANTARCTIC EXPLORATION. See **POLAR RESEARCH.**

ANTHONY, WILLIAM ARNOLD. An American physicist, died on May 29, 1908. He was born in Coventry, R. I., on November 17, 1835, studied in the Sheffield Scientific School, of Yale University, and after teaching physics and chemistry at Antioch College in 1867-69, physics at the Iowa Agricultural College in 1869-72 and the same subject at Cornell University in 1872-87, became a consulting electrician in New York City, and also professor of physics at the Cooper Union night school there. He was a member, and had been president of the American Institute of Electrical Engineers, and of the Franklin Institute, of Philadelphia, and had published *Theory of Electrical Measurements* (1902), and (with C. F. Brackett) a *Manual of Physics* (1898), besides contributing a chapter to Thompson's *Röntgen Rays and Phenomena of the Anode and Cathode* (1896).

ANTHROPOLOGICAL ASSOCIATION AMERICAN. See **ANTHROPOLOGY.**

ANTHROPOLOGY. Compared with the previous year, 1908 did not produce many novel points of view with respect either to man's origin or antiquity. Schwalbe reiterated his views on the specific character of the Neanderthal skull, which is disputed by Stolywo; Kollman still attaches phylogenetic significance to the pygmy races, and Kohlbrugge published a careful critical survey of these and kindred problems, without, however, making a positive contribution to the discussion. Towards the close of the year a sensational find was reported from France by Prof. Edmond Perrier. Skeletal remains found in strata of middle Pleistocene age include the skull of an ape-man of more than simian cerebral development, while the thick, low cranial dome, flattened forehead, prominent orbital ridges, broad nose and elongated snout-like maxillaries give it a gorilla-like appearance. The limb-bones are curved and seem to indicate that the anthropoid walked on all-fours. In Prof. Perrier's opinion, the remains represent a far more archaic type than those of Neanderthal or Spy, a type really intermediate between Pithecanthropus and recent man. At the end of the year the scientific world had hardly had ample time for adjudicating on the claims advanced for these interesting specimens and was awaiting a more detailed report.

There was steady progress in almost every field of ethnological, linguistic and archaeological research, especially in America. Of the North Pacific coast tribes, the Tlingit received adequate treatment in the course of the year. Lieutenant Emmons has described in detail the technique of the Chilkat blanket, the ceremonial robe of the northwestern tribes, while Boas showed that the decorative features of the garment are bodily derived from those of painted pattern-boards. Swanton, as the result of a thorough linguistic comparison, argues for an unmistakable, though very remote and possibly indirect historical relationship between the Tlingit and Haida languages. The labors of Kroeber, Barrett, Sparkman and Miss Constance G. Dubois have helped to clear up the problems of South Californian culture. It is now a definitely established fact that both the Shoshonean Luiseno and Cahuilla and the Yuman Diegueno made pottery prior to European influence. The Cahuilla present an interesting example of the mixed effects of geographical and historical environment. While neither a farming nor a fishing population like their eastern neighbors, the Mohave, they have nevertheless adopted a number of important traits from that tribe. Their houses are of Mohave type, the pottery is identical in material, shape and ornamentation, and both tribes have mesquite for their staple food, preparing and storing it in the same way. On the other hand, the Cahuilla reveal their kinship with fellow-Shoshonean tribes in their economic life, lack of martial sense and tribal organization, absence of totemic clan grouping, and the fundamental features of their spiritual life.

The presence of human remains in the auriferous gravels of California has been re-considered by Sinclair with negative results. The Pima have, for the first time, received extensive treatment in Dr. Frank Russell's posthumous monograph. The existence of notched calendar sticks recording historical events for a period of seven-

ty years is one of the most interesting discoveries made by the author.

Spinden's investigation of the Nez Percé clearly establishes the fact that this tribe, as a typical Plateau population, shared in approximately equal degree elements of Plains and North Pacific culture, and possessed originally one of the simplest cultures of North America. The deerskin garments of both sexes are of Prairie type, while the women's basket hat came from the coast. War regalia, parfleches and medicine bags were derived from eastern neighbors, while stone pestles, basketry technique and fishing implements came from the west. One type of habitation approaches the Sioux tipi, while the long-house suggests the plank village-houses of Colombian tribes. The social organization was characterized by village communities akin to those of the coast from California to the Straits of Juan de Fuca, and Nez Percé mythology shows relationship in either direction. The indigenous culture pristine to the acquisition of the horse was probably allied to that of northern California and southern Oregon.

Our knowledge of Plains mythology has been enriched by two substantial contributions,—Kroeber's Gros Ventre collection and Wissler's Blackfoot myths. From Wissler's discussion it appears that the trickster tales now centreing in the figure of the Old Man probably correspond to the old Central Algonkin mythological heritage of the Blackfoot. Many of the traditions are shared by other Plains tribes, but the ritualistic stories seem to be an original product of the Blackfoot mind. The ethnology of the Gros Ventre has been monographically treated by Kroeber. The author indicates the close similarity of the age-class ceremonial organization of the Gros Ventre and the Arapaho; at the same time the Gros Ventre differ, apparently, from all other Plains peoples, in having the same ceremony performed by several distinct companies of men of approximately the same age. Kroeber also essays a comparative analysis of the decorative art of the Plains area. In embroidered ornamentation the Blackfoot are shown to have developed a clearly differentiated style, while the Sioux-Assiniboine and Arapaho-Ute-Shoshone form the other distinct groups and the Gros Ventre and Cheyenne present no marked individuality. In parfleche painting the Shoshone stand out as the originators of a distinct style based on the combination of square and triangular motives, while with other tribes the triangular type pure and simple is predominant. An interesting problem of South American ethnology has been broached by Joyce in connection with a description of inlaid and incrustated specimens from Peru. As the inlay has been definitely identified as turquoise, which is not known to occur in Peru, the question arises whether this material was introduced from Mexico, between the inhabitants of which and the ancient Peruvians there is as yet no evidence of cultural contact, or whether turquoise deposits run within the ancient Peruvian culture-area. The archaeology of the Calchaqui valley was described by Ambrosetti, whose discoveries indicate the occurrence of two distinct cultures of respectively lower and higher type.

In Africa, the problem of ancient Egyptian somatology has again been attacked by Dr. C. S. Myers. The current view upholds the simul-

taneous existence of two races from time immemorial, one Caucasian, the other negroid, and that both still persist throughout the country. Dr. Myers contends that every province contains a homogeneous population, with provincial variations as to the extent of negroid characteristics. The Egyptians, he argues, were always a homogeneous people, varying now towards negroids, now towards Caucasian characteristics according to their own environment. A new point of interest in Egyptian history is Flinders Petrie's discovery of the existence of a Persian colony at Memphis. In northwestern Africa Benhazera and Aymard have made substantial contributions to the ethnology of the Tuareg of the Sahara, the former confining himself to the Ahaggar, the latter to the southern branch of the tribe. The Tuareg are Mohammedans, but practise monogamy, and in their religious life manifest a strong adherence to residual pre-islamitic conceptions. Old graves are consulted as to distant events, and there is a strong belief in vampires and other demons. Socially, there is a fairly sharp division into castes of nobles, vassals and slaves. Inheritance of caste is in the maternal line, and the women enjoy an almost unique degree of freedom, having property rights, suffrage in the tribal council, and the privilege of dissolving marriage bonds at will. From Nigeria, Desplagnes reports the discovery of the ruins of an old city west of the Niger which he identifies with the capital of the old Ghanata realm mentioned in Arabian literature. In the same area, Leo Frobenius, having returned from his expedition to the Kasai region in the Congo State, is again at work among the Mandingo and neighboring tribes. He reports elaborate historical traditions apparently tallying with and complementary to those of Arabian chroniclers and extending back to mediæval times. The industrial life of the natives seems to have degenerated, but ceremonial activity manifests itself in numerous secret societies and circumcision festivals of overshadowing prominence. Like his French predecessor, Desplagnes, Frobenius was able to make interesting finds of stone artifacts.

The origin of the Benin culture revealed by the English punitive expedition of 1897, differing as it does in its bronze castings and ivory carvings from anything else of African provenience, has long baffled European investigators. Influenced by Prof. Grunwedel, Crahmer has recently suggested that the Benin industries were largely derived from East India. Our knowledge of East African ethnology was materially advanced by Prof. Karl Weule's preliminary report on his expedition to the Yao, Makua, and other tribes between the Lukuledi and Rovuma rivers. His discovery of the throwing-stick, which, while known in Australia, the South Sea, and in America, had never been observed among negroes, is noteworthy. He also succeeded for the first time in gaining an insight into the complicated boys' and girls' puberty ceremonials of Eastern Africa. While in Kamerun, Upper Guinea and Loango secret societies are closely connected with age-classes, the relation of age-classes and masquerade dances similar to those of secret societies proved far less intimate among the tribes mentioned. As the social organization of the Bantu was practically a terra incognita, the unraveling of the exogamic matrilinear clan system of the Yao, Makua and Makonde by Weule is another achieve-

ment of great importance. The historical traditions, military, social and hunting customs of the Wahehe of German East Africa were investigated by Captain Nigmann. It is a noteworthy fact that among the Wahehe "totemism" is restricted to food taboos inherited in the male line; neither marriage regulations nor acts of religious veneration are connected with them. An important contribution to our knowledge of Southern Africa is offered in an atlas of Kaffir industries with explanatory text by Muller and Snelleman, while newly observed rock-paintings of the Bushmen have been described by Professor Von Luschan.

Only a relatively small part of Asia is peopled by primitive races lacking historical records. Under the editorial supervision of Sir C. Lyall much light has been thrown on the ethnography of Assam by monographs on the Mikirs and Meitheids. The Mikirs are an agricultural people, distinguished from most of their neighbors by living in pile dwellings and differing from some by the absence of matriarchal institutions. The Meitheids of Manipur represent probably an offshoot of one of the Indian hill tribes. Both Mikirs and Meitheids have been affected by Hindu influences, which make themselves felt with special force in the sphere of religious belief and practice. Among the Mikirs even a vague belief in metempsychosis has been discovered. The epoch-making discovery of a Veddah stone-age by the Sarasin cousins in 1907 was followed in 1908 by Dr. Seligman's expedition to Ceylon. This investigator was able, by additional finds of quartz implements, to confirm the results of the Sarasins. While these explorers had investigated the technology of the tribe, Seligman devoted himself to the study of the social and religious customs. He discovered the existence of maternal descent with exogamy in most of the tribal groups, while in others there is paternal descent without exogamy. The subordination of some of the clans to others is a noteworthy feature of the social system. Religious life is dominated by the worship of the dead, who receive food-offerings and through the mediation of a shaman express their satisfaction, pledge their support, or give counsel to the tribe. Decorative art is very slightly developed, being practically confined to crude rock-paintings, and legendary material is also extremely scant. On the whole, Dr. Seligman finds traces of a far more intimate contact with Singhalese culture than is commonly supposed.

An extremely important contribution to Asiatic ethnology was made in the second part of Dr. Jochelson's memoir on the Koryak, continuing Volume VI of the results of the Jesup North Pacific Expedition and dealing with the history, material culture and sociology of the tribe. The Koryak are divided into two large groups, the Reindeer and the Maritime Koryak. The former live in reindeer-skin dwellings consisting of an outside tent and an inner sleeping-tent, the characteristic of the former being the union of a lower cylindrical part with a conical roof, such as is found among the nomad Mongol and Turkish tribes. The Koryak form of this type of dwelling, Dr. Jochelson conceives as a compromise between the Asiatic nomad type and the Eskimo snow-house. The Maritime Koryak dwell in semi-subterranean earth-lodges with a funnel-shaped storm-roof; these represent an older form of habitation, while the tents probably appeared among the Koryak together with

the domesticated reindeer. Jochelson shows that the semi-subterranean house formerly existed among all palæ-Asiatic people, such as the Chukchee, Kamchadal, Gilyak, Ainu, and Yukaghir, while they were absent from the territory of the Turkish Mongolian tribes. Jochelson compares the palæ-Asiatic underground house with that of northwestern America and finds its closest parallel in the dwellings of the ancient Aleut and Alaskan Eskimo; he inclines to the theory that historical contact, not independent invention accounts for the spread of the semi-subterranean lodge over the northeastern Asia and the North Pacific coast of America. As a moiety of the Koryak tribe breed reindeer, the problem of the origin of this cultural feature obtrudes itself on the ethnologist's attention. Jochelson traces its distribution from Lapland to the Chukchee. As the Lapps own the best-trained race of reindeer and have advanced to the stage of storing provender for their herds, he inclines to the view that, if reindeer-breeding spread from a common centre, its origin is to be sought in the extreme west of the Old World rather than in northeastern Asia, where but partial domestication has been effected and where the Koryak use the domesticated animal more for slaughter than for transportation. It is possible, as Bogoros suggests, that the Koryak and Chukchee tamed wild reindeer found in their territory under the influence of Tungus culture, but without actually obtaining tamed animals from the Tungus. This is supported both by the diversity of the Tungus and Koryak species and from the use of the animal for riding by Tungus and for draught by the Koryak. The fact that the Koryak were originally a sedentary people and later adopted a nomadic life as a necessary incident to maintaining herds is of high theoretical significance in view of the commonly accepted scheme of human evolution from an originally roaming to an ultimately settled mode of life. Excavations of ancient Koryak underground dwellings led to the discovery of potsherds, establishing the existence of pottery among the Koryak in the recent past. Turning to the ceramic finds of other palæ-Asiatic tribes, especially the Ainu, Jochelson, in accord with Koganei and Laufer, refutes the assumption that the pottery was made by any race other than the immediate predecessors of the present populations. The Ainu, more particularly, must simply be supposed to have lost the art with the advent of metal utensils.

In Australia, Dr. Eylmann has supplemented the labors of Howitt, Spencer, Gillen and Roth by a study of the South Australian aborigines. Strehlow has begun the publication of reports on the Arunta (Aranda) and their southwestern neighbors, the Loritja. He is able to correct some statements of Spencer and Gillen with respect to totemistic conceptions. According to these authors, the totem deities wandered about in the mythological age and ultimately descended into the ground, while their bodies assumed the shape of trees, rocks, or stone and wooden charms called *churingas*; the birth of children is uniformly ascribed to the never-ceasing re-incarnation of the totem. Strehlow has found a variety of conceptions as to the cause of birth. Either a germ inherent in the transformed totem-body may enter the body of a female passer-by; or, the totem may ascend from under-ground and throw at her a small bull-roarer, which develops into an infant; or,

the totem itself may enter the woman and be re-incarnated. The last case, however, is rare, and never can a totem experience a second re-incarnation. The linguistic problem was attacked by Planert, who, on the basis of data furnished by an Australian missionary, has worked out the grammar of the Arunta and Dieri languages. The sixth volume of the Reports of the Torres Straits Expedition sheds a flood of light on the magic and religion of the Eastern Torres Straits islanders. It is the joint work of Drs. Haddon, W. H. R. Rivers and C. S. Myers. A point of interest in this work as well as its predecessor, is the original plan devised by Prof. Rivers, of studying the complicated kinship system of a primitive tribe by means of an elaborate genealogical record. Van der Sande's *Nova Guinea* furnishes a mass of information on the ethnography of Dutch New Guinea. The author refutes the theory that all Papuans are dolichocephalic and establishes the hitherto ignored occurrence of weaving in part of the island.

Certain wide problems of theoretical significance continue to excite lively discussion. Among these is the origin of geometrical art designs, as to which three principal theories are advanced. Prof. Haddon suggests their derivation from life-like representations of the organic world, which have gradually become conventionalized. The German school, especially as represented by Dr. Max Schmidt, who has recently added a discussion of Peruvian decorative art to his former contributions to this subject, holds that the technique of basketry has led to designs which have later had a realistic meaning read into them. American students, such as Boas, Wissler and Kroeber, also contend that the name or symbolical interpretation of geometrical patterns is a secondary feature, but do not accept the technological theory, because it is found that even when technical conditions are the same, the artistic style may be quite different in different areas. The origin of higher religious conceptions has been rather vigorously discussed in England since Andrew Lang's theory that the most primitive tribes have already the conception of a morally pure supreme "all-father." In Germany Ehrenreich has adopted the same view, which was also being defended by P. W. Schmidt in a series of erudite articles in *Anthropos*.

The question of the dispersion of myths was given a curious interpretation by Assyriologists, who assume that all astral mythology originated in Babylonia and has thence traveled to the four corners of the globe. This curious theory was ably refuted during 1908 by P. W. Schmidt, who once more calls attention to the psychical unity of mankind as an explanation of strikingly homologous myths among unrelated or geographically remote peoples. The interpretation of myths is also a moot question. Frobenius, Ehrenreich and Stucken assume that myths are primarily representations of celestial phenomena; in America the standpoint has recently been defended that myths are originally nothing but folk-tales, which may subsequently be invested with an explanatory function or a celestial setting.

As always, there is a great deal of interest in the existence or non-existence of mental and physiological differences between the white and other races. Dr. F. G. Bruner made a special

study of Indians, Negroes and Filipinos subjected to the mental tests of the psychological laboratory from which it appears that in the hearing sense at least positive differences do exist, the whites showing superiority in most cases. This is in general agreement with the results of the Cambridge Anthropological Expedition to Torres Straits. Dr. Aleš Hrdlička has brought out a discussion of his observations on the physiology of the Indians from which it appears that there are some differences in rate of pulse, muscular strength, in dentition, respiration rate, etc., though he himself considers them of no functional significance.

ANTHROPOLOGICAL SOCIETIES AND FIELDWORK. An anthropological event of cosmopolitan significance was the Sixteenth International Congress of Americanists, which met at Vienna from September 9th to 14th. The United States was represented by Profs. Boas, Saville, MacCurdy and Peabody. The sessions were marked by a very full consideration of South American problems. Owing to the national celebrations planned for 1910 by Mexico and the Argentine Republic, it was decided to hold two distinct sessions in that year, one in each of these countries. The difficulty of considering American problems apart from those of the Old World having become manifest at the meetings, the idea was broached of expanding the Congress into an ethnological convention embracing in the scope of its programme the entire field of anthropological science without continental limitations.

The American Anthropological Association held its annual meeting during Christmas week, joint sessions with the American Folk-Lore Society and Section 14 of the American Association for the Advancement of Science being held at Johns Hopkins University, Baltimore. The officers for 1908 are: President, Professor Franz Boas; Vice-Presidents, Miss Fletcher, Dr. G. A. Dorsey, Mr. Clarence B. Moore, and Prof. W. H. Holmes; Secretary, Dr. George G. MacCurdy; Treasurer, Mr. B. T. B. Hyde; Editor (of the *American Anthropologist*, the organ of the Association), Mr. F. W. Hodge. The Association is continuing to publish Volume I of its *Memoirs*. The Anthropological Society of Washington met regularly throughout the year, embracing in the scope of its discussions practical problems of Indian education and administration as well as strictly anthropological questions. Its officers are: President, Dr. Walter Hough; Vice-President, Mr. James Mooney; Secretary, Dr. John R. Swanton; Treasurer, Mr. George C. Maynard; Councilors, Messrs. F. W. Hodge, C. L. Robinson, J. N. B. Hewitt, I. M. Casanowicz, and W. E. Safford. Monthly meetings were held by the Ethnological Society of New York, which is affiliated both with the New York Academy of Sciences and the National Anthropological Association. General Wilson, President, and Prof. Saville, Secretary, are the executive officers. The American Folk-Lore Society continues the publication of its *Journal* under the new editor, Prof. Franz Boas.

The Bureau of American Ethnology (Chief: Professor Wm. H. Holmes) has issued its *Twenty-sixth Annual Report*, embodying Frank Russell's "The Pima Indians" and Swanton's "Social Condition, Beliefs, and Linguistic Relationship of the Tlingit Indians." Progress is reported in the preparation of the second volume of the *Handbook of the American Indians*

North of Mexico and of the *Handbook of American Languages*, both of which were in the proof-sheet stage. The United States National Museum has published in its *Proceedings* Prof. Mason's "Vocabulary of Malaysian Basket-Work" and Prof. Boas' "Decorative Designs of Alaskan Needle-cases." The death during the year of Prof. Otis T. Mason (q. v.) was deplored by technological students the world over, and Dr. Walter Hough temporarily assumed the head of the division of ethnology. A considerable number of field expeditions have been conducted under the auspices of American institutions. The American Museum of Natural History equipped the Stefansson expedition to the Eskimo between the Mackenzie and Coppermine rivers. Mr. Harlan I. Smith continued his archaeological survey of Wyoming; Dr. Robert H. Lowie studied the Chipewyan of Lake Athabasca and the Assiniboine of Montana; Mr. Alanson Skinner visited the Cree of James Bay; and Mr. Gilbert L. Wilson commenced his investigations of the Hidatsa. Dr. George A. Dorsey, curator of ethnology at the Field Columbian Museum, undertook an ethnological trip around the world, in the course of which he crossed the Island of Bougainville; Dr. William Jones and Mr. Fay Cole were continuing their work in the Philippines. Dr. Frank G. Speck of the University of Pennsylvania and Free Museum of Arts and Sciences investigated the Montagnais of Eastern Canada. The Department of Archaeology of Phillips Academy, Andover, Massachusetts, explored certain caverns in the Ozark Mountains, Arkansas, under the direction of Prof. Charles Peabody and Mr. W. K. Moorehead. The School of American Archaeology founded by the Archaeological Institute of America undertook excavations in Colorado, Utah, and New Mexico and has projected an expedition for the study of Maya culture. Dr. J. Walter Fewkes of the Bureau of American Ethnology went to the Mesa Verde National Park in Colorado to direct the excavation and preservation of the cliff-dwellings there. Professor A. L. Kroeber of the University of California made another trip to the Mohave Indians of Arizona and California, while other members of the department completed the survey of about three hundred shellmounds on the northern shores of San Francisco Bay and continued ethnological studies among various Californian tribes. Mr. George G. Heye of New York equipped an ethnological expedition, undertaken by Dr. S. A. Barrett, to the little-known tribes of Ecuador, and under the same auspices Prof. Saville made an archaeological trip to this country in the early part of the year. Of English expeditions may be mentioned Dr. Seligman's visit to the Vedda, Dr. W. H. R. Rivers' investigations of the Solomon Islands and E. Torday's researches among the Upper Congo tribes. The ethnological section of the great Russian Riabouschinsky expedition has started, under the leadership of Dr. Waldemar Jochelson, to explore the Aleutian Islands and Kamchatka. The French besides exhaustive studies of the archaeology of their native land, are carrying on investigations among the natives of Nigeria. Dr. Leo Frobenius, the well-known German scholar, was at work in the same region, and in Costa Rica Dr. Walter Lehman of the Royal Ethnographical Museum of Berlin was engaged during the year in linguistic studies and archaeological excavations.

To the anthropological journals there has been added the *Revue des Etudes Ethnographiques et Sociologiques* (Paris), edited by M. Arnold Van Gennep, known for his writings on Madagascar and Australia.

The teaching of anthropology has been advanced in several American institutions. The University of Pennsylvania has added to its corps of instructors, Dr. Edward Sapir, who lectures on North American linguistics; Mr. Spinden has been appointed a teaching fellow at Harvard University; at the University of Minnesota the Department of Anthropology has been organized into a division co-ordinate with the Department of Sociology, into which it had previously been merged; and at the University of Nebraska, Dr. Hutton Webster lectures on both sociology and anthropology.

ANTIGUA. An island of the British West Indies, constituting, with Barbuda and Redonda, a Presidency of the Leeward Islands (q. v.). Total area, 170 square miles; total population (1904), 34,953. St. John's, the capital, had 9,262 inhabitants in 1901. About 17,000 acres are under cultivation, mainly with sugar-cane. There are two central sugar factories. The sugar output was 23,000 tons in 1907-8, and 25,000 tons in 1908-9. Other products are cotton, tamarinds, arrow-root, and molasses. The imports and exports in 1907-8 were valued at £168,396 and £174,972 respectively. The revenue in 1907-8 was £50,620; the expenditure, £46,968; and the public debt, £130,500. Antigua is the seat of the Governor of the Leeward Islands—in 1908 Sir E. B. Sweet-Escott.

ANTIMONY. As antimony was in slight demand during 1908, but little of the metal was mined during the year in the United States and low prices prevailed. In 1907 the United States Geological Survey reported the production as 2,022 short tons valued at \$622,046 as compared with 166 short tons valued at \$602,949 in 1906. In 1908 there were heavy imports of Chinese ore at low prices which filled the American market restricted as it was by the absence of any demand from the railroads by whom it is used in the manufacture of anti-friction metal. But one smelter, that at Chelsea, Staten Island, was in operation during the year and the price for the metal averaged 8.704 and 8.419 cents per pound for Cookson's and Hallett's brands respectively as compared with 16.969 and 15.527 cents in 1907. The imports of antimony in the form of metal, regulus, ore and salts far exceed the domestic production and in 1908 amounted in value to \$679,909 as compared with \$1,604,179 in 1907.

ANTIQUARIAN SOCIETY, AMERICAN. A learned society, organized in 1812. The membership is restricted to 140, new members being elected because of prominence in some phase of historical or intellectual activity. Its library which is located at Worcester, Mass., contains 100,000 volumes and many thousand pamphlets and is rich in early American imprints, newspapers, almanacs, Spanish Americana and American history and antiquities. It has published eight volumes of *Transactions*, as well as its *Proceedings* from 1843 up to date. Its officers are: President, Waldo Lincoln; Vice-Presidents, Edward Everett Hale, and Samuel Abbott Green; Secretary for Foreign Correspondence, Franklin Bowditch Dexter; Secretary

for Domestic Correspondence, Charles Francis Adams; Recording Secretary, Andrew McFarland Davis; Librarian, Clarence Saunders Brigham.

ANTI-SALOON LEAGUE. This organization, which has done notable work in the spread of the prohibition sentiment throughout the United States, especially in the South, began with the organization of an Anti-Saloon League in the District of Columbia, on June 23, 1893. From this grew the national organization, which was founded in Washington on Dec. 18, 1895, mainly through the efforts of Bishop Wilson of the Methodist Episcopal Church. The object of the League is the federation of churches of every name with the temperance societies and other organizations opposed to the liquor traffic, and the concentration of these forces against the common enemy. Its object is thus expressed by one of its chief officers: "The object of the League is the ultimate extinction of the liquor traffic; it does the possible good while pressing on to what is yet the impossible best. It has no permissive feature in its creed. It stands for prohibition in every foot of territory that existing public sentiment will capture or keep. To this end it bolts conventions, puts principle above party, and absolutely refuses to quarrel with any individual or agent that hates the liquor traffic." The work of the League in 1908 will be found noted in the article PROHIBITION. The officers in 1908 were as follows: (1907-1909) President, Bishop L. B. Wilson (Methodist Episcopal); Vice-Presidents, Bishop G. M. Mathews (United Brethren), Father James M. Cleary (Roman Catholic), Rev. David J. Burrell, D. D. (Reformed), Bishop J. W. Hamilton (Methodist Episcopal), Rev. Frederick D. Power, LL.D. (Disciples), Rev. W. B. Crumpton, D. D. (Baptist), Judge Charles A. Pollock (Methodist Episcopal), Rev. Washington Gladden, D. D. (Congregational), Rev. William L. McEwan, D. D. (Presbyterian), Rev. J. C. Barr, D. D. (Southern Presbyterian), Bishop H. C. Morrison (Methodist Episcopal Church, South), Bishop William N. McVickar (Protestant Episcopal); General Superintendent, Rev. Purley A. Baker, D. D. (Methodist Episcopal); Recording Secretary and Secretary of Headquarters Committee, Rev. S. E. Nicholson (Friends); Corresponding Secretary, Mr. James L. Ewin (Methodist Episcopal); Treasurer, Mr. Foster Copeland (Presbyterian); Assistant General Superintendent, Rev. G. W. Young, D. D. (Methodist Episcopal Church, South); Chairman Headquarters Committee, Rev. Howard H. Russell, D. D. (Congregational); President Board of Trustees, Rev. Brooks Lawrence (Presbyterian).

ANTITOXIN. The annual report of the Metropolitan Asylums Board, London, England, for 1907, supplied further testimony to the value of antitoxin in diphtheria. From 1887 to 1891 the death rate in cases admitted to the board's hospitals was 33.6 per cent., and in 1893, the year previous to the advent of antitoxin, 30.1 per cent. During 1907, it was 9.6 per cent. and from 1902 to 1906, 9.3 per cent. The significance of these figures is accentuated by those of the Brook Hospital, at which a record has been kept of the mortality according to the day of the disease on which the antitoxin was given. During the decade, 1897 to 1907,

6,556 cases were treated. Of these 250 patients received an injection of antitoxin on the first day of the disease and all recovered; 1,513 were injected on the second day with a death rate of 4.3 per cent.; 1,690 received antitoxin on the third day, with a mortality of 11.2 per cent.; 1,338 were injected on the fourth day, with a mortality of 16.9 per cent.; and 1,765 received antitoxin on the fifth day with a mortality of 18.6 per cent. Antitoxin sera was administered by Parkinson through the rectum in cases where objection was made to the hypodermatic needle. A cleansing enema was given where necessary, and the serum injected into the lower bowel through a glass syringe. The antitoxins were absorbed, and took effect in the same way as after subcutaneous injection.

ANAPHYLAXIS is the term applied to a condition of hypersensitiveness developed in certain individuals after a dose of antitoxin has been given them. A second injection in such individuals, if given within a short time, produces symptoms of profound toxemia, not seldom ending in death. This phenomenon attracted wide notice in 1908; a large number of cases were reported and extensive investigations were undertaken in the hope of solving the problem. At the end of the year no satisfying theory had been evolved, and there was no means of determining beforehand whether anaphylaxis will develop in a given individual. The reaction is caused not only by the bacterial vaccines, but also by other proteid materials such as ordinary horse serum and white of egg. Wells studied certain phases of the chemistry of anaphylaxis, and found that egg albumen freed from other proteins of egg-white, sensitizes in doses as small as 1/20 of a millionth of a gram and that the minimum lethal dose for sensitized guinea pigs is about half a milligram by intraperitoneal injections, and from 1/20 to 1/10 milligram when thrown directly into the blood. He thinks that, in view of the effect being produced by such minute doses, the injected material is not the lethal agent, but that it causes death by liberating toxic substances from the cells of the intoxicated animal; and further, that both sensitizing and intoxicating agents are either identical or different portions of the same molecule. Consult "Anaphylaxis Induced by Bacterial Proteins," by D. H. Bergey, M. D., in the *Jour. Am. Med. Association*, Sept. 5, 1908.

ANTI-VIVISECTION. See VIVISECTION.

AQUEDUCTS. The Catskill Aqueduct of the New York City water supply, which is to deliver 500,000,000 gals. per day, will carry water from the Catskill Mountains to within the city limits. During the years 1907 and 1908 the proposed line was under careful examination, particularly that portion of it crossing beneath the Hudson from Storm King Mountain on the west, to Breakneck Mountain on the east. Numerous wash boring and diamond drill hole examinations were made to determine the nature of the material through which the line must pass, especially at the Hudson River section. In connection with the same general scheme to supply New York City, and which at first it was estimated would require \$161,000,000, but later found, would cost \$210,000,000, it was proposed to develop a supply from driven wells to be sunk on Long Island, in Suffolk County. This it was believed would furnish 250,000,000 gals. per day, and at a cost, not in excess of \$47,000,000,

part of which would be required for the construction of a 75 mile aqueduct to convey water to Brooklyn, and other sections at the western end of the Island. All American records were broken for tunnel work during the month of October, when measurements in the south heading of the Elizabeth Lake tunnel of the Los Angeles aqueduct showed an advance of 446 feet, the best previous figure having been obtained on the Gunnison Tunnel which is part of the Uncompahgre irrigation project of the United States Reclamation Service. The Elizabeth Lake Tunnel, forming part of the aqueduct, will carry the water through the Coast Range Mountains, and be 27,215 feet long when completed. It is 12 by 12 feet in cross section and located about 60 miles north of Los Angeles. The Los Angeles Aqueduct, which was begun in 1907, is one of the most important works of the kind ever put under construction, and its cost was estimated at \$25,000,000.

ARBITRATION AND CONCILIATION, INDUSTRIAL. Conditions in 1908 were favorable for the increased adoption of methods of arbitration in the settlement of trade disputes. Several causes were contributing to this result. The consolidation of industry and the increasing centralization of labor union organization and control have resulted in the possibility of labor disturbances affecting wide areas and a large proportion of the supply of some service or commodity upon which public welfare depends. The public in self-defence have asserted the primacy of their interests, and have made a vigorous demand that trade disputes be settled without resort to industrial war. These conditions are especially apparent in the supply of transportation both municipal and interstate, and the supply of coal, but exist in many less important cases. As a result, both employers and workmen are more and more recognizing the rights of the public and resorting to arbitration to settle their differences. Though 1908 was a year of industrial depression and unemployment (see UNEMPLOYMENT), it was by no means notable for strikes and lockouts. See STRIKES AND LOCKOUTS.) This was very largely due to the unusual use of arbitration and conciliation. Arbitration takes the form of the submission of disputed points to a joint committee representing employer and employees or to a board of public men so chosen as to insure impartiality or to state labor bureaus. The method to be used is usually prescribed in joint trade agreements between employer and union. Conciliation is usually the result of intervention of state or national labor bureaus under laws authorizing such interference in the interest of the public, though occasionally conciliation is brought about by private agency. Thus the New York Bureau of Mediation and Arbitration reported that between January 1 and September 1, 1908 there were 94 new joint trade agreements between employers and unions in that State; some of these were between associations of employers and organized labor. During the same period the Bureau intervened in more than two-score of strikes and lockouts, while a half dozen cases were successfully arbitrated by the Bureau and private agencies.

The National Bureau of Labor was equally active in conciliating labor differences. The Erdman Law of 1898 which remained practically unused until 1907, became in 1908 a most effective means of averting strikes. For the

first time, a year of serious industrial depression was passed without an extensive railroad strike. This was due to the uniform maintenance of the wage level brought about largely by Chas. P. Neill, Commissioner of Labor, and Martin A. Knapp, Chairman of the Interstate Commerce Commission, constituting a sort of government board of mediation and arbitration. These men mediated not only in cases involving wages of railway employees, but in others involving various phases of the relation of union labor to employers. The undoubted success of this board during 1908 will add greatly to its growing prestige with both labor and capital, a condition increasingly favorable to its success. The significance of the board's activities is increased by the fact that wage reductions by the railways would have stimulated wage reductions elsewhere with consequent increase in labor disturbances. A bill was introduced in Congress favoring compulsory investigation of trade disputes, but received little consideration. Organized labor opposed it as a step toward compulsory arbitration. President Roosevelt's interest in maintenance of industrial peace led him to send Mr. Victor S. Clark to Canada to inquire into the working of the new Industrial Disputes Investigation Act of March 22, 1907. His report was published in the *Bulletin of the Bureau of Labor* for May, 1908. The Canadian law provides for compulsory investigation of trades disputes, and their decision by an impartial board; it leaves the disputants free to accept or reject the award. Mr. Clark found that the act had undoubtedly reduced the number of strikes. While the time during which the act had been in force was short and trade conditions abnormal, Mr. Clark judged that it had on the whole affected working conditions favorably, and had not affected industries adversely. He believed it much more applicable to conditions in the United States than compulsory arbitration would be. He found that both employers and public in Canada with very few exceptions are favorable to the act, while considerable division exists among the working people. The labor opposition he found to be due to the belief that workmen can accomplish more by negotiations backed by sudden strikes than when strikes are deferred; and also to the belief that government intervention is likely to have a class bias hostile to labor. The results of the operation of the law during the year show these beliefs not to be well founded. A law embodying the essential features of the Canadian law was proposed in Wisconsin near the close of the year for legislative action in 1909.

CANADA. The new law of March 22, 1907 was called into operation in several important and many minor labor disputes with uniformly satisfactory results. This law compels the submission of trade disputes to an arbitration board and forbids either a strike or lockout during the deliberation of this board, but does not attempt to compel acquiescence by either party to the decision rendered. The belief that this latter service will be accomplished in all important cases by a determined expression of public opinion was fully warranted by the results of the first year's experience. During this first year 29 trade disputes in which strikes were threatened were submitted to an arbitration board under the new law. Of these 28 were successfully settled. Of the disputes settled 13

concerned coal mines, 3 metalliferous mines, 8 railroads, 2 shipping and one street railways; the one not settled concerned coal mines. Later, in 1908 occurred a second notable failure resulting in the strike of the machinists of the Canadian Pacific Railroad. (See STRIKES AND LOCKOUTS.) In addition to the comments made on this law in the preceding paragraphs it should be noted that the success attending a skillful arbitrator has tended to bring about his selection over and over again. The best results have been achieved by informal proceedings, with an almost entire absence of court methods and dominated by an evident spirit of conciliation. The other method of more strictly judicial procedure with sworn witness and an attempt to thrust forward the police features of the law has not proven successful.

ENGLAND. The Board of Trade issued during the summer a report of the proceedings, under the Trade Disputes or Conciliation Act of 1896. This act provides for voluntary arbitration or conciliation, the arbitrators to be chosen jointly by the parties interested or by means of the intervention of the Board of Trade. This latest report shows that in the period between August 1896 and July 1907 there were 232 cases dealt with under the act, and that of these 168 were successfully handled. In 140 of all the cases application for arbitration or conciliation was made by both parties to the dispute, in 60 cases by workmen, in 22 cases by employers, and in the remaining cases by arbitrators who had failed to agree. Of the cases dealt with 82 were in the building trades, 45 in the metal, engineering and shipbuilding trades, 27 in mining and quarrying, 20 in the boot and shoe industry, 17 in transportation, 14 in printing trades and 11 in textile industries. Some of the largest and most portentous trades disputes have been settled by the voluntary methods provided by this act. The large strikes of 1908 were thus settled. (See STRIKES AND LOCKOUTS.) In July the Scottish Miners' Conciliation Board agreed to a reduction of 6d per day in wages. About 100,000 miners were affected.

NEW ZEALAND. New Zealand was known for many years as "the land without a strike." This was owing to the compulsory arbitration law requiring the submission of trade disputes to a special Arbitration Court, whose decisions must be obeyed. However late in 1907 a group of slaughtermen struck; they gained an advance in pay, but all those who could be located were fined more or less heavily for violating the compulsory arbitration law. Since then several strikes have occurred. These strikes have all been small; no sympathetic strikes have occurred so that disturbances have been locally confined. The apparent reason for this breaking down of the arbitration system is that labor is becoming more and more dissatisfied with the results of the system. So long as the decrees of the Arbitration Court tended to be favorable to labor no trouble was experienced in enforcing the law. Public opinion, even among laborers, strongly resented resort to illegal means of industrial warfare. Advancing wages reappeared in higher prices, and the Court latterly has refused many times to grant labor demands, on the ground that workmen are receiving fair wages and fair treatment. Hence the growth of opinion among workmen adverse to the law and favorable to resort to more vigorous methods. They

say that since employers, who at first were opposed to the law, are now supporting it, it must be advantageous to them, and therefore disadvantageous to labor. The acute political controversy arising out of the situation led to most drastic legislation. The new law passed in October completely remodeled previous arbitration acts. It provides a penalty of £10 for each striker and an additional fine of £1 for each week the strike continues. Lockouts are made punishable by a fine of £200, plus £50 for each week they are in force. Special penalties are provided for strikes in industries most closely connected with public convenience and welfare. If strikers default in payment of fines, these are to be deducted from their wages when they return to work, employers retaining 20 per cent. of weekly wages. The Boards of Conciliation are abolished and replaced by Councils of Conciliation to be composed of a salaried commissioner and six assessors from the industry concerned, three appointed by each party to the dispute. If the Council fail, the case goes to the Arbitration Court. The previous uniform wages law was also amended, the Arbitration Court being authorized to fix a normal or average wage and also an "exertion" wage, or extra pay for extra work. The new law was received with expressions of bitter opposition by the New Zealand Trades Council, representing organized labor. The bone of contention was the right to strike, and labor manifestoes issued near the close of the year indicated that the new act is likely to be put to severe tests.

NEW SOUTH WALES. A struggle similar to that in New Zealand was acute in New South Wales. Labor demands the right to strike and the public has outlawed the strike as destructive of its welfare. In March the arbitration act was amended by the creation of conciliation boards for each industry. The primary object was to reduce the number of cases that must be taken to the arbitration court, thus expediting the settlement of disputes. In July occurred a strike of State employees on tramways in Sydney. The government refused any investigation except that provided for by the new act. The Premier obtained from the Industrial Disputes Court permission to prosecute the strike leaders and collect heavy fines from the trade union involved. After a few days of conciliatory persuasion most of the strikers returned to work. Both during the strike and at its close there were almost riotous manifestations of dissatisfaction with the arbitration laws.

ARBITRATION, INTERNATIONAL. See INTERNATIONAL ARBITRATION.

ARBITRATION, LABOR. See ARBITRATION AND CONCILIATION, INDUSTRIAL.

ARCHÆOLOGICAL INSTITUTE OF AMERICA. A learned society, founded in Boston in 1879 and incorporated by act of Congress, approved May 26, 1906. The legal act of incorporation was achieved on January 2, 1907. The purpose of the institute is to promote archæological research by founding schools and maintaining fellowships; by conducting excavations and explorations, and aiding in those conducted by others; by publishing the results of archæological research and by holding meetings for the presentation and discussion of archæological subjects, and by maintaining courses of public lectures. Under the auspices of the Institute, the American School of Classical Studies at Athens was established in 1881 and incor-

porated in 1886. This school has an endowment of about \$100,000 and a building and library in Athens. The Institute and the School maintain each a fellowship, and the Carnegie Institution at Washington supports a fellowship in architecture in the school and grants \$1400 annually for excavation. The American School of Classical Studies in Rome was organized in 1895. It has an endowment of \$100,000. The Carnegie Institution maintains two fellowships for research in the school and grants \$1000 annually for publication. The American School for Oriental Study and Research was founded in 1900 and has already done important work in explorations in Palestine. The School of American Archæology was founded in 1907. It directs all the researches of the Institute in the American field, and affords opportunities for field work and training students in archæology. An extensive system of coöperation with universities and scientific organizations for investigation in the various parts of the American Continent is in process of organization. During 1908 excavations were conducted in Colorado, Utah, New Mexico, and Central America. See ANTHROPOLOGY.

Courses of lectures are provided annually for each society. American scholars, representing various fields of archæology, art, and literature, are sent as lecturers, and arrangements are made to secure the services of foreign lecturers from time to time. The Institute is composed of twenty-one affiliated societies. These were in 1908 as follows: Boston Society, New York Society, Baltimore Society, Pennsylvania Society, Chicago Society, Detroit Society, Wisconsin Society, Cleveland Society, Connecticut Society, Washington Society, Iowa Society, Pittsburg Society, Southwest Society, Colorado Society, Cincinnati Society, St. Louis Society, Rochester Society, the Utah Society, San Francisco Society, Kansas City Society and Northwest Society. The membership is about 2,000; the official publication is the *American Journal of Archaeology*. The officers in 1908 were as follows: President, Francis W. Kelsey; Vice-Presidents, Charles P. Bowditch, Allen Marquand, George F. Moore, Edward Robinson, and F. B. Tarbell; Secretary, Mitchell Carroll, George Washington University, Washington, D. C.; Treasurer, William Sloane.

ARCHÆOLOGY. If possible, 1908 saw greater archæological activity than ever before. Not only were the Americans, English, French, Germans, and Italians busy, but the growing interest in the work is evinced by the formation of a new society in Italy, organized for the purpose of excavating in Egypt.

At Assur the Germans continued their explorations. The site of the great city wall on the western edge of the hill was examined and four building periods, extending from 1300 B. C. to 600 B. C., were made out. Of the inner wall 1100 meters were searched, in which extent twenty-nine towers and two doors were uncovered; of the outer wall 1300 meters were followed and four doors located. In the course of the digging, houses of various periods were discovered. These belonged to Assyrian and Parthian settlements. Of particular interest is the recovery of a chest-shaped document of Shalmanasar II, containing details about the building of walls. Of prime importance was the finding of inscriptions of Sin-šar-iškum which tell that he gave a Nebo Temple in Assur.

At Babylon the excavations on the western edge and southern corner of the Southern City, so-called, were finished. By means of a sectional cut the outer city wall between Babil and Nilbrücke has been examined. It proved to consist really of two walls, an inner one seven meters in thickness, and an outer one 7.66 meters thick, with an intervening space of 12.40 meters between them. Before the outer wall lay still a third one of 3.33 meters thickness. The excavations on the site have brought about a necessity for revising our ideas as to the size of ancient Babylon. The enclosed area was found to be much smaller than has been supposed. In the "palace" mound were discovered two palaces, one of them erected by Nabopolassar, the other by Nebuchadrezzar. Between them ran a street. The later building consisted of series of chambers arranged around courts. Of the latter the royal was the largest, and on the southern side of it was found the audience chamber of the Selamik. The front of the chamber showed a rich floral decoration in enamelled bricks.

At Susa the French excavations under the direction of de Morgan met with results quite comparable with anything done before on the site. The deposit representing the old town begins at a depth 75 feet below the present ground level and consists of a stratum varying from 12 meters to 15 meters in thickness. The antiquity of this deposit is proved by the inscription found in it. From this stratum came almost innumerable objects, such as painted vases, axes, spear-heads, saws, and cooking utensils of bronze, and a large collection of carved images; owing to repeated sacking of the town but little gold and silver were found. There was discovered, however, a fine statue of King Kari-busha-Shushinak. His throne is decorated with an heraldic group of lions. Besides this statue were recovered a magnificent head of a priest-prince, and a stele of Sargon the Elder dating about 3800 B. C. and showing a sculptured decoration of warriors, captives, and vultures feeding on corpses.

At Saktjegözy, north of Aleppo, Garstang excavated, and discovered a temple surrounded by a wall six and one-half feet thick. The main gate of the wall was decorated with lions and composite figures in the form of winged quadrupeds with human heads, and tails ending in birds' heads. Several bas-reliefs showing the king accompanied by his falconer and other officials, and a winged disk containing a crescent and a star were discovered, as well as a circular altar supported by two sphinxes; and other bas-reliefs showing the king or god seated at a table with a worshiper and an eagle-headed demon performing the ceremony interpreted usually as the fertilization of the date palm. While Assyrian influences are present in the work, the treatment suggests rather the work of Hittite artists of the eighth century B. C.

At Olbia in Southern Russia excavations brought to light the foundations of what appears to be a fortress. An interesting find was that of a gilded spindle of human bones.

SYRIA AND PALESTINE. The examination of the great tunnel at Gezer was completed. It was found that it ended in a cave in which was an abundant spring. The tunnel itself descended by a sequence of eighty steps until its lowest one was 130 feet below the level of the ground and only an inch or so above the level of

the water. The length of the tunnel is 219 feet. In niches along its sides probably stood statuettes. The tunnel was first dug at a date not later than 2000 B. C. From that time it continued in use until abandoned in the years between 1400 B. C. and 1200 B. C. The spring with its underground approach may well have been used to supply the city with water in time of siege, and may also have been used for religious rites. An interesting find in connection with the excavations was that of two small lumps of iron, the oldest evidence we have of the use of that metal in Palestine. On the same site, Gezer, was found an ivory pectoral bearing a figure of the Egyptian King Meren-Ptah adoring Thoth. On the ivory were also cartouches of the King. This corroborates what has been known for some time, namely, that Meren-Ptah had obtained control of Gezer. In a cistern, contemporary with the eighteenth dynasty in Egypt, were found the fragments of three fine alabaster vases and a beautiful saucer. In a trench, among other objects, was discovered a scarab of a Hyksos King. A skeleton of a youth who had been cut in two was found in one of the foundation deposits.

EGYPT. At Abusir the Germans completed the excavation of the temple for the cult of the dead. This splendid building, which was built before all the pyramids, was erected by Schu're. At Abydos Garstang found a grave, dating in the Hyksos period, which contained black and glazed vases of non-Egyptian character resembling those coming from Syria and Asia Minor. On the strength of this evidence the idea is put forward that the much discussed Hyksos belonged to the Hittite folk-group. The work of the Egyptian Research Account at Gizeh has brought to light remains of the first three dynasties. The remains give the impression that the civilization at this place was similar to that of Abydos. Stone vases and objects of flint and ivory were discovered. The Expedition of the Metropolitan Museum of New York City uncovered the northern side of the pyramid at Lisht and also laid bare its entrance. Work was inaugurated as well at the Oasis of Kharga, where, it is hoped, material important for the study of the Græco-Roman and early Christian periods will be found.

By his excavations on the site of the temple of Ptah at Memphis, Petrie showed that in both the first and second temple court were great granite doors in form like the entrances to tombs, and that these served for offerings made in honor of the builder King Rameses. During the eighteenth dynasty, apparently the offerings were collected, and, except for the most important, thrown away. In the earth under the foundations of the great west hall were discovered a considerable number of small offering tablets, dating before the beginning of Rameses temple. More than twenty are complete. The arrangement of this west hall is noteworthy. In the middle is a great group of columns whose function was to support a special roof and to afford light for the hall. Opposite the great pylons were colossals of white limestone, and behind them another colossal statue of alabaster. On both sides of the entrance were similar ones of red granite. In the valley of the tombs of the Kings at Thebes Mr. Davis continued his remarkable discoveries. Here was opened a tomb in which were found jewels belonging to Queen Ta-usert, the grand-daughter of Rameses II.

The work in this tomb was rendered especially difficult owing to the fact that the clay with which the chamber had been filled had solidified to the hardness of rock. The tomb apparently was a private one to which for some reason the jewels had been removed. Inscriptions on some of the jewelry prove that Ta-usert was the wife of Seti II. As a fact some objects found had been the property of this King. Such were two epaulets, in the form of poppy flowers suspended from a plate which in turn hangs from a gold bar. On these was Seti's name. Along with these epaulets should be mentioned a couple of silver bracelets, on which are represented Seti seated on his throne with his wife before him. In addition were found a large number of rosettes bearing the names of both the King and Queen. On what appears to be the King's signet ring is a vulture goddess surmounted by a symbol of the sun-god. The decoration was inlaid in precious stones. Still another ring showed the name of Rameses II in open work of gold. Among the jewels of the Queen were hundreds of open-work balls and poppy flowers, which had been strung as a necklace. In the same valley was also found a prehistoric grave containing the embalmed bodies of men of small stature. Near the tomb in which were found Ta-usert's jewelry were discovered the foundations of workmen's huts. These exhibited the interesting feature of a pot set into the floor—to conceal money probably. From a neighboring rubbish heap was taken a bouquet of papyrus blossoms which had been stitched to keep the petals in place.

In the winter of 1907 and 1908 was recovered at Antinopolis two parchment sheets containing thirty lines each from the *Perikeiromene* of Menander. The manuscript which dates from the third or fourth century A. D. bears the original page numbers 51, 52 and 71, 72. Korte finds that these two pieces overlap by 57 lines a portion of the *Lefebvre papyrus*, a fact which identifies the two sheets as surely belonging to the *Perikeiromene*. The second sheet also pieces out the *Oxyrhynchus* fragment of the same play published by Grenfell and Hunt in 1899, following the latter after a gap of about seven lines. So by means of these two new sheets we can get the length of the play—which was about 1000 lines long—and can reconstruct the plot with comparative certainty.

One of the most interesting recent discoveries is that of Brugsch who has found the hieroglyphic record of the seven years' famine described in Genesis. In the inscription it is told how the Nile did not overflow for seven years, and how, as a result, the vegetation withered, the crops failed, and famine, pestilence and misery devastated the country. The date of the inscription is 1700 B. C., which is close to the time given in Genesis.

Grenfell and Hunt recently edited a fragment of an uncanonical gospel from *Oxyrhynchus* and while not written before the fourth or fifth century, it goes back to an original dating before 200 A. D. The bit concerns the Jewish ceremonies of purification in connection with the temple worship. A Pharisee has been angry at Christ and his disciples for neglect of the necessary ceremonies, while he himself was clean. The narrative goes on, "The Saviour answered and said unto him, 'Woe, ye blind, who see not. Thou hast washed in these running waters wherein dogs and swine have been cast night

and day. . . . But I and my disciples, who thou sayest have not bathed, have been dipped in the waters of eternal life."

As a result of the dam at Assuan fifteen temples besides Philæ have been submerged.

GREECE. The Greeks were active in the archæological field during the year. The stupendous task, undertaken by the Greek Archæological Society, of laying bare the Agora and the north slope of the Acropolis at Athens (see YEAR BOOK, 1907) was begun. In the area to the east of the Theseum, from which the houses were removed in 1907, certain walls of ancient date have been uncovered. Unfortunately they cannot yet be assigned to any known buildings, and their place in the complex of buildings which we know to have surrounded the Agora is not to be determined until the remaining portion of this territory, now covered with buildings, is expropriated and rendered accessible to the excavators. The cost entailed by such expropriation is great. Outside of Athens much work was done. At Oropos the Amphiareion was the scene of excavation, and at Chalcis prehistoric tombs were opened. At Charonea a tumulus of the neolithic age was excavated, and among other objects, pottery bearing red decorations on a white ground were taken from it. The resemblance of the pottery to that recovered by the English in Phthiotis proves that the same culture spread over this northern portion of Greece in the neolithic age. From the same tumulus other vase fragments bearing a dull dark, painted decoration were taken. Their style suggests that of ware from Ægina described by Furtwängler as early hand-made Mycenaean ware.

The most notable find made by the Greek Society was at Pagasæ in Thessaly. Here in Roman times a large tower had been constructed around a smaller one of the fifth century, and for filling between the two the builders had made use of hundreds of stelai from a necropolis. The remarkable feature of these stelai of which some thirty complete specimens and over 1000 fragments were found, is that the decoration is painted and not sculptured. The stones date between the fourth and the second centuries B. C., and inasmuch as the list of colors is large and the work not flat but shaded, we have in them one of the best means for reconstructing the art of painting in Greece at the time of their production. Work was continued at Sounion. On both sides of the road leading from the harbor to the temple, houses were discovered, and many votive offerings dating before the Persian war. The Society was also busy at Tegea. At Mycenæ it has excavated and strengthened the so-called tomb of Clytemnestra. To complete the excavation of the site of the Throne of the Amyclæan Apollo, upon which work was interrupted by the death of Furtwängler, the Church of Hagia Kyriaki, which stood on top of the mound, has been removed, and the digging completed.

CRETE continues to offer much of archæological interest. In the spring of 1908 Evans concentrated his efforts at Knossos on what he calls the Little Palace, which lies to the west of the Great Palace. The building proved to be of great size, that is to say, it is over 114 feet along the front and covers an area of something over 9400 square feet. From the evidence offered by the remains of its stone stairways we know that, like the

Great Palace, it was of more than one story. Its date is about 1700-1600 B. C. One of the most interesting finds made on the site was a black steatite vase in the form of a bull's head, found in a chamber sanctuary. The eyes of this remarkable head were of rock crystal hollowed out and colored on the under side to represent the pupil and iris, and the nostrils were inlaid with shell. Another object worthy of notice is a finely carved relief in ivory of a griffin pulling down a bull. In the southwestern part of the Palace, work was continued on a great rock-hewn vault, the size of which may be judged from the fact that excavation has shown the floor of it 52 feet below its dome. Perhaps the most remarkable finds in Crete and its related islands have been made by the American Seager who worked so successfully in 1907 at Psaira. In the island of Mokolós, which is not far from Psaira, he found a Minoan settlement, the history of which falls into two periods. The first ends at the beginning of the Middle Minoan period, the second dates from the end of the Middle Minoan and closes during the Late Minoan. Of these two settlements the earlier is the more important. From six chamber tombs of the older town came a remarkable collection of vases of alabaster, marble, and other stones, some of which are as thin as modern china. From the same tombs were recovered various gold objects, such as diadems, hairpins, chains, etc., of very delicate workmanship. Suggesting an analogy with the seal, recorded in the YEAR BOOK for 1907, which showed a horse in a boat, is a fine gold signet ring on which is shown a boat with the bow in the form of a horse's head. The Greek excavations have shown that the plain of Messará in Crete was thickly populated in the Early Minoan age.

The Italians continued their work at Pharastos. As a result of their labors it is now possible to make out fairly well the plans of the two Minoan Palaces on the site. In connection with the older, which dates from the Middle Minoan period, it was discovered that the Cyclopean substructures of the outer walls were not constructed with an unbroken surface but with rectangular bastions breaking out at intervals. The entrances were guarded by towers of a square plan, and strongly built. The remains thus suggest that Pharastos was not, like Knossos, an unfortified palace, but was like Tiryns well protected and able to withstand assault. The propylaia discovered on this site is the oldest known in Greece. Up to it led a flight of 12 steps over 40 feet broad. Directly in front of the gate was a broad paved area. The gateway itself, which differs somewhat from that at Tiryns, is flanked by two square pillars, while a column standing between them produces a double entrance.

Probably the most important discovery made by the Italians was in the northeastern part of the site during the work of clearing some houses contemporary with the early palace. The find is that of a terra cotta disk about 6 inches in diameter stamped on both sides with symbols in the form of men, fishes, birds, trees, plants, and various utensils. These symbols which number over 120 on each face are stamped, as with type, between lines which run spirally from the centre to the edge of the disk. The archaic temple found by these same archæologists at Prinia

last year, has now been completely excavated with the result that the building is now known to consist of a cella and pronaos. The former was open wholly or in part. The east wall, which supported the heavy frieze, was much thicker than the side walls, which were built of a concrete of mud and small stones. In the middle of the inner chamber was located a rectangular pit lined on its four sides with gypsum plates. Traces of burning in this pit make it evident that this, contrary to the usual custom in Greece, was an altar for burnt offerings. Before this altar was found the base of a cylindrical column. Near this temple was discovered another which had both a pronaos and epinaos. To judge from the remains such as vase fragments and other votive offerings, the date of the temple is the same as the one previously found. In the epinaos which was used as a store-room were found pithoi decorated in low relief. In the temple and near by were also recovered fragments of vases decorated in a manner suggestive of late Mycenaean and early Geometric. This temple, like the other mentioned, had an altar for burnt offerings. These altars may mark the transition from the open air sacrifice of the Mycenaean period to the subsequent altars for bloodless offerings in the classic times.

At Delos the French continued their excavation of the great building which they found last year. It proved to be a hall 36 by 55 meters divided on the inside into six aisles by five rows of nine columns. The building was evidently constructed with a clearstory, and was hypæthral in the middle. The treasures have been completely excavated.

The German excavations at Olympia have brought to light house walls underneath the Pelopion, which demonstrate that the antiquity of Olympia is much greater than has usually been believed. Other excavations on this site have shown that three periods can be made out for Olympia, namely, the classical, geometric, and prehistoric. In the neighborhood of the Heraion, Pelopion, and Metroon a number of prehistoric house walls have been located, of which four are well enough preserved to allow a reconstruction of the ground plan. These buildings ended in an apse of semicircular form. From the hill of Kronos prehistoric and Greek vase fragments have been recovered.

The work of the British School at Sparta produced some interesting results. In investigating the deposit around the old altar found in the arena of the Roman Amphitheatre the English archaeologists found a rich deposit dating in the late sixth and early fifth centuries B. C. Below this came to light the remains of what is doubtless the ancient temple associated with this altar. Although only parts of the foundation remain it can be made out that the building was of sun-dried brick and wood. Its date is believed to be as early as the eighth or ninth century B. C. One of the most interesting results connected with a work of the English at Sparta is the proof that the so-called Cyrenaic ware is but a development of the Laconian ware. Here at Sparta it has been found that the orientalizing style of pottery, which is akin to what has been known as the Cyrenaic, begins after the Geometric, passes through a pre-Cyrenaic into a true Cyrenaic style and degenerates in the fifth century B. C. The British School

also excavated the site of ancient Itonos in Phthiotis. Here a neolithic deposit of great depth was examined from which was taken specimens of hand-made pottery with red decoration on a white ground, of a nature akin to that found by the Greeks at Chæroneia, and in Thessaly. The excavations have shown that the Bronze Age in Northern Greece began much later than in the Southern Ægean.

Dörpfeld, still intent on proving Leukas the ancient Ithaka, continued his work in the plain of Nidri the southern part of which has been thoroughly explored. The remains found in one place, where the water has been led into the plain, Dörpfeld is inclined to believe to be those of a prehistoric garden. In another locality in the plain the German scholar found eight cist graves containing contracted burials. Parallels with this method of interment Dörpfeld sees at Tiryns, Orchomenos, and near Knossos. The pottery found bears a resemblance to that found at Drachmani and recorded in the Year Book for 1907. The objects discovered have led the excavator to the belief that the settlement represented by them was the Achæan city of Homeric Ithaka, and that the inhabitants under the pressure of the Dorians moved to modern Ithaka. Perhaps the most important find for Dörpfeld's theory is that of the remains of a prehistoric building some 30 meters in length which the excavator believes to be the palace of Odysseus. Near by were found graves, the contents of which resemble those of the shaft graves at Mycenæ. To prove that Kakóvatos is the site of the Homeric Pylos Dörpfeld has continued his excavations on that site.

The Americans continued their undertaking of laying bare the site of ancient Corinth. Besides this, their attention was directed to the Propylæa at Athens which they carefully studied with a view to the restoration of the structure.

On the coast of Asia Minor the Germans carried on their excavations at Pergamon. The neighborhood of the gymnasium has been the scene of most of their labors. A temple has been cleared and the base of a group of three statues dedicated possibly to Herakles, Hermes, and Asklepios. Besides this a number of fine halls were laid bare. The inscriptions discovered relate, in some instances, to the ruling house of Pergamon, and in others to the native and foreign epebes. At Miletos work has been initiated with the result that the history of the older portions of the town has been made out from Mycenaean times down to the time of the Persian invasion of 494 B. C. The pottery on the site extends in an unbroken series from the late Mycenaean style down to the Attic red-figured fabric. On the Lion Harbor the building, which was formerly believed to be the Prytaneum has been shown to be a gymnasium for free boys. It was founded about the middle of the second century B. C. by Eudemos, whose gift for the purpose was ten talents of silver. The excavations conducted on the site of the temple of Apollo at Didyma has brought to light a great wall of pre-Hellenic date which served to separate the terraces lying to the east of the Temple.

At Lindus, in Rhodes, the Danes have cleared the town and tombs which they had previously located. Inside the walls of this town two sanctuaries have been discovered, and one outside. The pottery recovered is of importance,

for by it light is thrown on the intimate trade relations which existed between Naukratis and Rhodes.

Among the individual finds made is one which should be recorded. It is that of a terra cotta figurine recently discovered in a tomb, by a peasant it is said, in the neighborhood of Monemvasia. This figurine, about 50 cm. in height, is of interest because of the close likeness which it bears to the famous Aphrodite of Melos, now in the Louvre. If the statue is genuine (some doubts have been expressed on that point) it shows us that the Aphrodite of the Louvre may have held a mirror in her left hand, while she supported her slipping drapery with her right—for such is the position and action of the arms preserved on the statuette.

ITALY. In excavations at Rome conducted at the Arch of Titus, foundations were found which the excavator, Boni, thinks to belong to a structure reared by Romulus. At Ostia a room was excavated on the walls of which were painted single figures at each of the four corners. The floor was paved with black and white mosaic. On it were found ancient money, several amphoræ with painted inscriptions, glass with gold letters, lamps, remains of inlaid furniture, etc. A corridor led to a lower room, the windows of which were evidently glazed with mica. At Nola during the digging preliminary to laying a sewer were found a bust of the Emperor Claudius, a torso of a figure on a cuirass, and a late Latin inscription. At Pompeii in five places were found Oscan inscriptions painted in red about ten feet from the ground on columns of houses. It is thought that they were notices to tell visiting strangers where to find the nearest bankers.

Excavations at Gela in Sicily have shown that this city occupied the site of modern Terra Nuova. A number of notable finds have been made here. Among these may be mentioned sarcophagi with rich decorations painted on them, and an especially interesting vase with a decoration representing a theatre scene. The subject represented is a Satyr play and the two doors of the proscenion are visible one at the right and one at the left. In Sardinia Mackenzie reports the discovery of a number of prehistoric dwellings and graves scattered over the island.

AFRICA. At Dougga the French have discovered a temple of Saturn with a large number of the columns still preserved. A statue of Athena was found whose girdle was ornamented with a head of Medusa. An Apollo nearly ten feet high was also discovered. At Timgad a Byzantine mosaic has been recovered which represents Aphrodite Anadyomene accompanied by a Triton and a Nereid. The work is completely preserved and was found in a house of Trajan's city.

FRANCE. Excavations at Alesia have disclosed a small temple and a square which is surrounded by a portico. This is probably the forum. On the west side of it was found a building with three apses—perhaps a basilica—and several houses with deep cellars of careful construction. Under these remains were traces of a Gallic settlement the buildings of which were round, square, or irregular shaped huts, some with and some without walled foundations. The upper part of these huts was of wattle and daub.

BELGIUM. At Liège traces of a Roman villa were found, and at Trèves one of the most interesting Roman villas yet found has been cleared. It consists really of three buildings, which are connected by curving corridors so that the baths are in one wing and another group of buildings on the other. There are two courts, and the entire plan of the villa has been adapted to the curve of the river at this point.

ENGLAND. Under a church in Dorchester was found a stone, probably placed there by the Norman builders of the church, which bears an inscription reading "To Caius Aristus, Roman citizen, aged 50, Rufinus and Charina, and Avea, his children, and Romana, his wife (or his Roman wife) set up this stone." While excavating for building purposes near Christ's Hospital, London, a portion of the Roman inclosing wall of the city was found, as well as a number of objects, among which were curious bone skates, broad and polished underneath, and pierced with holes for fastening them to the feet.

ARCHÆOLOGY, AMERICAN. See ANTHROPOLOGY.

ARCHBOLD, JOHN DUSTIN. Vice-president and active head of the Standard Oil Company, was born in Leesburg, Ohio, on July 26, 1848, and had a public school education. As early as 1864 he had become interested in Pennsylvania oil fields, especially those of the Titusville region, and his activities there brought him into contact with the Standard Oil Company. In 1872 he was one of the group of producers who attacked the South Improvement Company, a concern controlled by the Standard, and formed, it was openly charged, solely to get from the railroads more favorable shipping rates than could be obtained by other producers, but in 1873 he was one of the supporters of what was then known as the "Pittsburg plan," also a rebate scheme believed to have been fathered by the Standard. Two years later he became publicly identified with the Acme Oil Company of Titusville, reported at that time to be one of the Standard's subsidiary companies, and in this capacity was very active in getting control of oil properties in the neighborhood of Titusville for the Acme company. At this time he became a director of the Standard, and subsequently was made its vice-president. During the presidential campaign of 1908 Mr. Archbold was made conspicuous by reason of certain letters he had written several years before to Senators Foraker, McLaurin and other politicians, copies of which were read at political meetings by William R. Hearst. See **PRESIDENTIAL CAMPAIGN; STANDARD OIL.**

ARCHERY. This sport is under the control of the National Archery Association of the United States. The thirtieth annual tournament took place in Chicago on August 18, 19, 20 and 21. The double York round championship was won by W. H. Thompson, with a total score of 973, the double American round by Robert Williams, with a score of 1007, and the double national and the double Columbia rounds by Miss Harriet Case with scores of 398 and 546 respectively.

ARCHITECTURE. In the minds of architectural scholars one of the most notable events in the architectural record of the year 1908 was an exhibition of archaeological drawings. Mr. H. Hulot, "pensionnaire" holder of the

Grand Prix de Rome in Architecture had been for some time engaged in investigating the ruins of the ancient Greek city of Selinus in Southern Italy. The result, in a superb series of drawings exhibited in Paris, presented a wonderful and surprisingly complete exemplar of an ancient Greek maritime city, its walls, gates, streets, quays, harbor, open spaces, monuments and houses, constituting one of the most important contributions ever made to our knowledge of the civic architecture of ancient times. In the popular mind, however, interest in the architectural progress of the year 1908 chiefly centered in the development of concrete as a material of construction and a medium of architectural expression. In the widening applications of this material, France, the country of its origin, and the United States, appeared to be leading the rest of the world, with Germany and Austria closely following. English conservatism was only slowly entering upon this use of concrete in architecture, although the year has witnessed far more rapid progress in this line than any of its predecessors. It was still, however, in its experimental stage both in the United States and Europe, but tests, formulæ and text books were multiplying and a body of experience has accumulated which would before long lead to concentration of effort along certain definite lines. But little use has so far been made of concrete as a material for external expression in architecture, most designers preferring to conceal it behind brick, stone or marble or to face it with stucco. There can, however, be no doubt that it will in the near future come into wide use for exterior and monumental design, powerfully influencing and perhaps revolutionizing architectural style. Mr. Edison's "monolith" concrete house, produced at one casting, has contributed nothing to this result; for it is of so barbarous a design as not to enter into the category of architecture at all.

In the matter of *style*, the year 1908 showed no marked advances, although the tendencies of previous years continued to manifest themselves. Thus in France the old struggle between the Latin or classic and the Gallic or romantic tendencies continued in evidence. The house on the Rue Benneville in Paris which was awarded the annual prize in 1908 as the best exterior composition was a remarkably refined design in the classic Renaissance spirit by M. Tersling. At the same time the street architecture of hotels, apartments and business houses in Paris was marked by a frequent eccentricity of mass and outline and a studied avoidance of classic precedent which resulted in façades often indescribably ugly, in spite of much exquisite carved detail of flowers and figures. The Art Nouveau movement has by no means produced a real style in architecture, and many of its efforts in this line, especially in Germany, have far overstepped the limits of architectural propriety and entered the domain of the absurd and the grotesque. But there can be no denying that the reflex influence of the movement has been beneficial on the whole, inspiring in those who still adhere to the traditional styles a greater freedom, and in many cases a greater regard for the pure logic of design, than has been common in the past. Perhaps the greatest of all living masters of architectural design in 1908 was Professor Otto Wagner of Vienna, who succeeded to a wonderful degree in blending the

freedom of the New Art with the repose, dignity and beauty of mass and proportion, of the classic styles.

In the United States something of the divergent tendencies noted in France is to be observed in the past year's work, but divided along very different lines. The French form of the style of innovation and protest called L'Art Nouveau did not make its appearance in serious architecture in this country; but the kindred spirit was manifested in a very interesting way, and with results superior to most of its European products, in many places, but especially in much recent work by a group of Chicago architects who may be held to constitute a veritable school, under the acknowledged leadership and inspiration of Mr. Louis H. Sullivan, and among whom may be numbered such men as H. v. D. Shaw, I. L. Wright, Myron Hunt, G. W. Maher and others. Their work displayed vigor, originality and refinement, and was only rarely eccentric in either mass or detail. Largely consisting of suburban and rural dwellings, small and large, it also included not a few striking and important commercial and public buildings, of which the most original is without question a bank by L. H. Sullivan in Ottumwa, Ia.

The division between this and other schools following more traditional lines, is largely geographical. In New York, and indeed throughout the country at large, the work of the year 1908 exhibited the continuance of the previously noted tendency to apply particular styles to particular types of building. The banks and libraries, public buildings for cities, States or the Federal Government, and museums of art, erected, begun or completed in 1908 were almost invariably in some version of the neo-classic styles; while the churches, a large proportion of the educational buildings, and a few commercial buildings were erected in some form or phase of the mediæval styles.

In England, the work of the year showed a tendency towards a severer classical manner in public buildings and monumental works than has sometimes been the case, although the British architects still cultivated more than most of their neighbors the breaking up the main masses into many parts, and a certain complexity of sky line. As usual, the most interesting work of the English architects was in the two departments of ecclesiastical and of domestic architecture, in which they stand, on the whole, distinctly in the lead. The vagaries of Art Nouveau architecture have apparently found no entrance into the British offices.

No great international competitions were announced during the year. There occurred, however, one interesting case of international collaboration—begun, indeed, in 1907, but brought to fruition in 1908—in the Franco-British Exhibition held in London during the six months from May to November. The architectural part of this enterprise, projected by Mr. Kiralfy, was entrusted to an international commission of six architects, three British—Messrs. Delmar, Belcher and Fulton; and three French—Messrs. Toudoire, Coste and Duquesne; besides many assistants. Like other recent exhibitions this one followed American precedents in its series of separate "palaces" of staff, grouped in an elaborate landscape setting in which basins and bridges played an important part. The usual French superiority in this sort of scenic decora-

tive design was by no means clearly manifest except in cleverness of detail. By contrast with the clever work of the British architects in this exhibition, the architecture of the Scottish National Exhibition at Edinburgh, by Walker and Ramsay, appeared tame and commonplace.

Meanwhile, to close the chapter of exhibition architecture for 1908, the directors of the "Alaska-Yukon-Pacific Exposition of 1909," broke the record for forehandedness by the substantial completion ahead of time, of the principal buildings and even of the grounds of the exhibition in 1908, from designs by Howard and Galloway. The site was upon the grounds of the Washington State University at Seattle, and one of the buildings is a permanent structure to be used in the future by the University.

Turning now to the architectural annals of the Old World in detail, the most important occurrence was the eighth biennial meeting of the World's Congress of Architects, which was held at Vienna under the presidency of Herr Otto Wagner, drawing a large attendance from all parts of the world. In the exhibition of photographs and drawings, the American display attracted wide and favorable notice. The Congress debated many subjects, including the ethics and regulation of competitions, concrete construction, the preservation of historic monuments, and passed resolutions urging international or universal protection of copyright in architectural designs, the establishment by all governments of Fine Arts Commissions, and concurrent action to secure access for architects to the great monuments of the art in the Ottoman Empire.

More or less important buildings begun or completed in the German-speaking world included among many others a new Ministry of War at Vienna, by L. Baumann; and in the same city an interesting Handelsakademie (Commercial High School) by Deininger; a palace for the Landtag (Diet) and Ministry at Oldenburg; a town hall at Barmen; a monumental fountain at Düsseldorf, and a number of theatres, savings banks and churches of varying importance. Most of these were awarded to their architects as the result of public competitions. The architectural possibilities of the new art of aviation were suggested by the competition held in Germany for a landing-stage and floating shed for airships (balloons) at Friedrichshafen. At Berlin there was little new construction of first rate importance, though in spite of the widespread financial depression, there was still considerable work done of the everyday sort. We may note one large commercial building, the Passagekaufhaus ("arcade" building) of Franz Ahrens in the New Art style, well designed, but a little cold in effect; and a strikingly effective cold storage warehouse in brick by Max Bucholz. At Charlottenburg a new building for the Superior Court was completed, in a thoroughly Baroque style.

Little or no work of note was reported from Paris for the year. Throughout France generally there has been the usual grist of theatres, hospitals, hôtels de ville and school buildings, displaying thoughtful design in many cases, and marked by the usual finish and refinement of French work, but without any strongly forthcoming product. One of the most important among the building enterprises of the year was the competition for an extensive hospital in

the suburbs of Toulouse, won by M. Quitard. An interesting City Hall in the Moorish style was erected in the city of Algiers by the French Colonial government.

The Hague reported the award of the design for the gardens of the Peace Palace, now in process of erection, to Thomas Mawson of London after a limited competition; and in Denmark an important competition was held for the development of a new outlying suburban district of Copenhagen.

In Great Britain the architectural activity has been considerable. The extensive improvements begun some years ago in London, and which are destined materially to change the aspect of the city—the Aldwych and King's Way enterprises in particular—were actively prosecuted. The first section of the new Public Offices at Westminster, reported a year ago as in process of erection, was completed, and a fine Doric arch or bridge erected to connect it with the Home Office, from a design by Paul Mountford and the sculptor W. S. Frith. The completion of the entire block—an imposing structure measuring 600 by 300 feet and surrounding a noble circular court—it was thought would occupy several years. The architect in charge was Sir Henry Tanner, succeeding the late John Bryden, to whom was due the original design. Sir H. Tanner was also the architect of the important extension of the London Post Office.

The Franco-British exhibition has already been alluded to. The new Piccadilly Hotel was completed from plans by Woodward, Emden, Shaw and Greening, and many commercial buildings of considerable importance. At Cardiff (Wales), the new Town Hall was completed, designed by Lanchester and Rickards; at Leeds, new University buildings by Paul Waterhouse, continuing the general scheme of his father the late Alfred Waterhouse; at Liverpool the imposing building for the Mersey Docks Board Offices, reported last year, was completed after five years' work (Briggs and Wostenholme, Hobbs, and Thornely, architects); at Birmingham the new Council House by Ashley and Newman, for which the competition was held in 1905, and at Bristol a new Central Library by Percy Adams. One of the most extensive architectural operations in Great Britain, the Royal Infirmary at Manchester, was recently completed from designs by Edwin T. Hall and John Brooke; a group of 49 buildings covering 13 acres, and embodying the most recent developments of hospital architecture and equipment.

An interesting development both from the industrial and architectural points of view, was the continued progress of the movement for the erection of what are called "Garden Cities"—manufacturing settlements laid out on artistic plans with detached houses, as illustrated at Letchworth and Port Sunlight. In the field of mediæval archaeology and architecture, always of vital interest in England, attention was called anew during the year to the deplorable condition of Winchester Cathedral, whose foundations, laid in the eleventh century in a boggy soil, were giving way to an alarming extent, threatening the ruin of that venerable fabric. Hereford Cathedral has been adorned with a new west front, by J. Oldred Scott, which was dedicated this past year. From Spain was announced the impending ruin of the noble thirteenth century cathedral of Toledo, which was

From the drawings of the architects, George B. Post & Sons, N. Y.

THE WISCONSIN STATE CAPITOL — WEST ELEVATION

declared to be beyond the possibility of repair.

No very important constructions are announced either from Spain or Italy. The project for the construction of a monumental public square and civic centre at Bergamo, the competition for which was held a year or two since, appeared to have been not yet completed. The Venetian Campanile of St. Mark was carried up thirty or forty feet further towards completion.

SOUTH AMERICA. Coming now to the New World: from South America there was announced a competition for a Governmental Palace for the State of Rio Grande do Sul; from Buenos Ayres, a competition for extensive buildings for the Faculty of Science of the University. There was considerable building in the progressive republic of Mexico, but unfortunately there appears to have been little effort to acquaint architects in the United States with the details of this activity, either in Mexico or South America; and as little interest on the part of American architects to learn what was going on in the architecture of Latin American centres.

CANADA. In Canada building activity was normal and no edifice of first rate importance claims special notice. There has been held, however, a competition for a Parliament House at Regina, the capital of Saskatchewan.

UNITED STATES. In the United States the financial depression of 1907 and 1908 slightly checked, but by no means arrested the architectural activity of the year. Important operations announced in 1907 were continued or carried to completion. The construction of the great Cathedral of St. John the Divine at New York advanced more rapidly than at any previous stage, the four colossal arches which were to carry the tower having been completed and the choir vaulted and roofed. It is regrettable that the completed work should be so inferior to the original designs as it now appears to be. The Public Library in the same city underwent no change externally, the year's work having been wholly upon its interior finish. At West Point, the process of erection of the fine group of buildings by Cram, Wentworth and Goodhue for the United States Military Academy, made notable progress. The State Capitol of Wisconsin at Madison, by George B. Post and Sons, was externally completed. The interesting group of buildings by the same architects for the College of the City of New York, announced a year ago as under way, were completed and were dedicated with impressive ceremonies on May 14.

Of work not previously reported, it is not easy to select the most important from the vast total of buildings and enterprises begun or completed during the year 1908. There were, however, a number of important competitions for buildings or groups of buildings, the account of whose execution will belong to the annals of later years. Two of these were for public buildings of the first magnitude in New York; for the new Post Office to be erected near the new Pennsylvania terminal, and for a new municipal office building close to the Brooklyn Bridge terminal. Both of these were won by McKim, Mead and White. The first was to be a long and comparatively low building, matching with its columnar façade the classic colonnades of the adjacent Pennsylvania Railroad Station by the same architects, under active construction.

The second was a "skyscraper," also of classic exterior. Two other competitions were for educational institutions. Messrs. Palmer and Hornbostel were the winners in that for the vast group projected for the Western University of Pennsylvania, with a design of strictly and severely classical style. It is noticeable that in both the last-named competitions very meritorious designs were submitted in a style based on the Gothic (by Howells and Stokes for the municipal offices, and by Janssen and Abbott for the University of Western Pennsylvania). The other University competition was for the development of the grounds of the University of Minnesota, and was won by Cass Gilbert of New York. The city of Springfield, Mass. awarded the commission for the new City Hall to Messrs. Pell and Corbett of New York, after an interesting competition. The successful design showed two balanced buildings of classic design respectively for the public auditorium and the municipal offices, dominated by a lofty campanile and clock tower—a novel and effective conception. In the same city the fine new library by E. L. Tilton (upon a very inadequate site) was well advanced towards completion. The competition held by the State of New York for a new State Prison at Fort Montgomery was awarded to Mr. Beardsley of Poughkeepsie, but the award was protested and became the subject of litigation.

In the National Capital, the great railway terminal or Union Station by Daniel Burnham was completed; the Agricultural Department building advanced; a fine design adopted for the National Museum by Hornblower and Marshall; and several banks and other semi-public buildings erected or begun. The Federal Government also adopted designs for or began work upon a new Customs House at Baltimore, by Hornblower and Marshall, and a Post Office at New Orleans from plans by Hale and Rogers. Among scores of other enterprises of equal or almost equal importance which lack of space forbids mentioning, the following may be taken as examples; the school group of the Normal and Latin Schools at Boston, Mass., by Peabody and Stearns, Maginnis, Walsh and Sullivan, Coolidge and Carlson; the University Club at Chicago by Holabird and Roche; the new terminal of the Chicago and Northwestern Railway in the same city, with a train-shed 840 feet long, by Frost and Granger; the new theatre on Central Park West in New York by Carrère and Hastings, well advanced towards completion; the new Academy of Music in Brooklyn by Herts and Tallant—an extremely successful work—opened for use in October; new buildings for the Union Theological Seminary, New York, by Allen and Collins, begun; a new wing added to the imposing structure of the Brooklyn Museum of Arts and Science (McKim, Mead and White); new buildings for the University of California, by J. G. Howard, and a new railway station at Scranton, Pa., by K. M. Murchison.

TALL BUILDINGS. "Skyscraper" architecture counted during the year the completion in New York of the Singer Building, a tower 648 feet high, and the erection nearly to completion of its overtopping rival, the Metropolitan Life tower, 700 feet high, while the Equitable Life Company filed plans for a 1000-foot monstrosity, whose erection still remains in doubt. The tendency was thus towards lofty towers cover-

ing only a part of the building site, instead of massive buildings partly surrounding a court.

Municipal improvement has continued to make progress, its greatest single achievement being the completion of the magnificent stone bridge across the Connecticut at Hartford, Conn., with the adjacent quay and park.

NECROLOGY. The necrology of the year included the distinguished architect and Professor of Theory at the Paris École des Beaux-Arts, Julien Guadet, at the age of 71; of J. M. Olbrich, the leader of the German secessionist or "Moderne Kunst" architects; of E. W. Mountford, F.R.I., B.A., born in 1855, in England; of Alfred Stone of Providence, one of the older members of the American Institute of Architects, and of Wm. Martin Aiken, in New York, formerly supervising architect of the U. S. Treasury.

ARCTIC AND ANTARCTIC EXPLORATION. See POLAR RESEARCH.

ARGENTINA. A republic in South America, consisting of fourteen provinces and ten territories. Area, 1,138,352 square miles. Population (1905) 3,954,911; estimated Dec. 31, 1907, 6,210,428. In 1906 there were 33,964 marriages, 197,861 births, and 103,451 deaths. The eastern provinces of Buenos Ayres, Santa Fé, Entre Rios, and Corrientes are the most thickly settled. The population of the city of Buenos Ayres, the capital of the Republic, at the end of 1907 was estimated at 1,129,286. During the year the birth rate of the city was 34.6 per 1000 of population, and its death rate, 16.4—an exceptionally favorable record. Other important cities, with their populations according to the latest censuses or estimates, are: Rosario (1906), 150,686; La Plata, 80,000; Tucuman, 55,000; Córdoba, 53,000; Bahia Blanca (1906), 37,755; Mendoza (1904), 35,314; Santa Fé, 33,200; Paraná, 27,000; Salta, 18,000; Corrientes, 18,000; San Juan, 11,500; San Luis, 10,500. The number of immigrants in 1907 was 257,924; of emigrants, 138,063. Of the immigrants, 90,282 were Italians, 82,606 Spaniards, 9,530 Russians, 7,436 Turkish, 4,125 French, 3,439 Austrians, 2,322 Germans, 1,659 British, 1,220 Hungarians, 1,118 Portuguese, 1,016 Argentinians, and the remainder, in the order of their numerical importance: Greeks, Swiss, Brazilians, Montenegrins, Bulgarians, Danes, North Americans, Rumanians, Belgians, Moroccans, Dutch, etc. In 1908 the government concluded an arrangement with a German syndicate for colonizing a large area in the Territory of Santa Cruz, in the southern part of the Republic.

EDUCATION. Nearly one half of the population over six years of age are illiterate. In 1907 the total enrollment at the 243 municipal schools of Buenos Ayres was 83,171, the average attendance being 68,183. In the province of Entre Rios, where the children of school age in 1907 were estimated at 83,500, only 46,800 attended school. In 1906 the total number of schools in the country was 5,941, with 16,192 teachers and 557,657 registered pupils. Secondary education is controlled by the Federal government. There are about 20 lycæums and 40 normal schools. For higher education there are national universities at Buenos Ayres and Córdoba; provincial universities at La Plata, Santa Fé, and Paraná; a school of mines, an agricultural college, a naval and a military school, etc.

PRODUCTION. The total area under cultivation in 1907-8 was 36,106,323 acres, of which wheat took up 14,233,158 acres; maize, 6,747,175 acres; linseed, 3,438,371 acres; and oats, 702,000 acres. The production of wheat for the season 1907-8 was 201,502,000 bushels; maize (preliminary estimate), 137,120,000 bushels; linseed, 42,695,000 bushels; and oats, 30,520,000 bushels. The area under rice in 1907-8 was 4352 hectares (1 hectare = 2.471 acres), and the production, about 13,000 tons, nearly all in the husk. In Jujuy some rice is shelled, but by such primitive methods that the product is broken and deteriorated. Sugar, which is protected by high customs duties, is produced mainly in the province of Tucuman. The output of sugar in 1907 was about 109,000 tons, to which Tucuman contributed 91,000 tons. For 1908 the sugar production was estimated at between 115,000 and 120,000 tons. The annual consumption of sugar in the country is between 140,000 and 150,000 tons, so that a considerable amount has to be imported. Wine is produced mainly in Mendoza, in which in 1907 vineyards covered 26,116 hectares, yielding 6,334,937 tons of grapes. The 1908 vintage of Mendoza and San Juan province was reported at about 1,200,000 barrels of excellent quality. Cotton covered in 1907 about 11,475 acres, yielding 7000 metric tons of cotton, or about 3300 bales of 500 pounds each. Silk-worm culture has taken firm root. The total number of mulberry trees is about 11,550,000, of which 5,200,000 are in the province of Santa Fé, 4,500,000 in Córdoba, 1,500,000 in Entre Rios, and over 350,000 in Tucuman, Salta, Jujuy, and Santiago del Estero. In Sept., 1908, a commission was established to study the silk industry and suggest means for its encouragement.

In 1907 the number of cattle was 25,844,800; sheep, 77,581,100; horses, 5,462,170; donkeys and mules, 545,870; goats, 2,566,800; and hogs, 2,841,700. In the southern territories cattle and sheep were increasing in numbers. In March, 1908, the ports were opened for the export of live stock, after having been closed for about a year on account of the foot-and-mouth disease. In 1907 there were exported 74,841 cattle, 7374 horses, and 110,567 sheep. At the beginning of 1907 there were 271 creameries, 18 butter factories, 68 cheese factories, and 37 "mixed" factories. In 1906 the milk used in these various establishments amounted to 168,616,288 litres (1 litre = 1.76 pint), the quantity of butter produced was 8,043,693 kilograms (1 kilogram = 2.205 lbs.), and of cheese, 1,394,292 kilograms. The Province of Buenos Ayres is the centre of the dairy industry. The meat packing industry has assumed large proportions. In 1907 there were slaughtered 931,048 cattle, 2,761,696 sheep, and 12,261 pigs. In the same year there were exported 138,222 tons of beef, 23,781 sheep skins, 1330 goat skins, and 54,375 hides. The export of wool was 154,810 tons.

The northern provinces are rich in valuable woods, and the timber trade should have a bright future. The export of quebracho logs in 1907 amounted to 246,500 tons; of quebracho extract, 28,195 tons. But it is reported that the rudimentary rules of forestry are neglected, that little or no provision is made to replace felled timber, and that deforestation is progressing at an alarming pace.

MINERALS. The mineral production of the republic of Argentina is quite insignificant. There are a few copper mines being worked, but it is said to be doubtful if more than one or two will prove remunerative. Coal has not been found, and experts seem to agree that the geological formation of the country precludes the probability of its existence in a serviceable form. Manganese has been found in considerable quantities, but in places where at present it cannot be worked profitably. Some rich lead pockets have been discovered. Tin ore of an inferior quality exists in the Province of Catamarca. Gold has been found in the territory of Neuquen. In the absence of coal, the industrial future of the country depends on the development of the petroleum deposits, which have been found in the north, in the province of Salta and Jujuy, at the foot of the eastern Cordilleras toward Chaco, and in the southern parts of Mendoza and Neuquen. In 1907 there were exported 33,350 kilograms of tin, 127,528 kilograms of iron ore, 3443 kilograms of silver ore, and 990,000 kilograms of borate of lime.

MANUFACTURES. Manufacturing, as in other South American countries, is in its infancy, and its development is greatly hampered by the lack of fuel. At the end of 1907 there were 350 flour mills, of which 60 were closed. The production of flour amounted in 1906 to 699,000 tons, and in 1907 to 677,536 tons. In 1907 there were exported 127,499 tons of flour to Brazil, which took nearly 93 per cent. of the entire flour export. The first glucose factory was recently opened at Baradera, Province of Buenos Ayres. There are a few small cotton spinning factories, some 200 tanneries, and about 100 shoe factories. In March, 1908, there was established at the town of Bruga, Province Entre Rios, a factory for the manufacture of rope and cord out of a fibre extracted from the wild palm called *caranday*. This is the first rope manufacturing establishment in the country. There is one factory for making cottonseed oil.

FOREIGN COMMERCE. The imports and exports, exclusive of coin and bullion, in 1906 and 1907 were as follows, in gold pesos (1 peso = \$0.965) :

	1906	1907
Imports	269,970,524	285,860,683
Exports	292,263,829	296,204,369

The import of gold and silver in 1907 amounted to 23,552,726 gold pesos, and the exports to 3,133,886.

The leading imports in 1907 were, in gold pesos: Foodstuffs, 20,915,396; tobacco, 5,010,491; wines, spirits, etc., 12,633,739; textiles, 47,333,191; oil, 8,084,771; chemicals and drugs, 8,188,495; timber and appliances, 6,360,043; paper and appliances, 5,702,264; hardware, 33,161,139; metals and appliances, 7,543,106; agricultural implements, 18,541,569; railway materials, 52,320,750; ceramic products, 20,634,552; building materials, 23,020,393. The export classes in 1907 were valued as follows, in gold pesos: Agricultural products, 164,091,621; pastoral products, 123,820,205; forest products, 5,342,357; game products, 829,559; mineral prod-

ucts, 565,039; various, 1,155,588. Among agricultural products wheat figures for 82,727,747 pesos, the total shipments aggregating 2,080,802 tons; linseed, 36,081,221 pesos, with 763,736 tons; oats, 3,593,397 pesos, with 143,566 tons; and maize, 23,711,708 pesos, with 1,417,007 tons. Among pastoral products are included live stock, mostly cattle, valued at 3,158,856 pesos, and tallow, 4,806,835 pesos.

The trade in 1907 with the principal countries of origin and destination is shown in the following table, in gold pesos:

From and to	Imports	Export
Germany	45,811,170	36,423,056
Austria-Hungary	2,394,660	751,974
Belgium	15,896,850	29,592,133
Spain	7,294,469	1,935,605
France	25,468,026	37,762,046
Italy	24,003,241	5,219,466
Netherlands	1,762,006	4,174,490
Great Britain	97,935,743	53,716,152
United States	38,842,277	10,940,436
Brazil	7,849,355	14,018,431
Uruguay	2,472,754	1,376,638

The value of imports from the United States represents 13.6 per cent. of the total value of imports, against 14.62 per cent. in 1906. The exports to the United States represent 3.7 per cent. of the total value of exports, against 4.56 per cent. in 1906. During the first nine months of 1908 imports declined slightly, but exports showed a considerable advance.

SHIPPING AND NAVIGATION. Direct Danish and Swedish lines to Argentina have been inaugurated. The Dutch Parliament voted a subvention for a national line to Argentina. In 1907 two Austrian ships arrived freighted with Austrian goods. A bill was prepared for the approval of the Argentine Congress, providing that river and coastwise trade must be carried on under the national flag. The German "Hamburg-South American" line, which has a regular service down the coast from Buenos Ayres to Punta Arenas, sails under the Argentine flag. The registered Argentine shipping (of over 100 tons) consisted in 1907 of 169 steamers, of 63,632 net tons, and 74 sailing vessels, of 27,155 net tons.

INTERNAL COMMUNICATIONS. At the end of 1907 there were 13,672 miles of railway in operation, 912 miles having been added in course of the year. The total capital invested in railways amounted at that time to 671,688,874 gold pesos; the profits for the year were 33,326,000 gold pesos. Of the 22 railway companies, 18 were English, 1 French, and 3 owned by the government. Towards the end of 1907 the railway from Jujuy to Quiaca, on the Bolivian frontier, 176 miles long, was opened. This is an extension of the Northern Central Railway, which is owned and operated by the government. On Jan. 17, 1908, the governments of Argentina and Bolivia exchanged ratifications of the convention of May 18, 1907, under the terms of which the Northern Central Railway was to be extended into Bolivian territory and a railway constructed from Tupiza, on the frontier, to Potosi. Preparations for the 55 mile extension in southern Bolivia from Quiaca to Tupiza had been begun. The length of the national telegraph lines in 1906 was 15,560 miles.

BANKS. The condition of the 17 banks in the country, including the Argentine National Bank, on March 31, 1908, was as follows, in pesos:

	Gold	Paper
Deposits	22,108,028	739,285,738
Discounts and Loans	37,530,489	683,287,669
Cash on Hand	33,007,739	215,272,714

Compared with Dec. 31, 1907, every one of these items shows a decrease on the gold side of the account, and the cash on hand shows a decrease also in the paper currency. The National Bank was founded in 1891 with a capital of 50,000,000 paper pesos. The net profits are added to the capital and reserve fund, which amounted in 1907 to 53,773,388 pesos paper and 3,695,796 pesos gold. In June, 1908, a law was adopted authorizing the President of the Republic to issue bonds of the internal or external debt, bearing not over 5 per cent. interest, to the amount of 17,800,000 gold pesos, for the purpose of increasing the capital of the National Bank. At the end of 1907 this bank had 104 branches throughout the country. The investments of British capital in Argentina were estimated in 1908 as follows: Government bonds, £70,394,773; municipal bonds, £2,990,680; railways, £137,845,844; banks, £3,580,000; tramways, £8,010,982; various companies, £20,910,584. Total £243,732,863, against £199,213,885 in 1905.

FINANCE. The budget of 1908 estimated the total revenue at 57,830,105 pesos gold and 83,766,359 pesos paper, and the expenditure at 24,450,259 pesos gold and 155,931,230 pesos paper (the paper peso is worth about half the gold peso). The principal estimates of revenue were: Customs, 50,700,000 gold; stamps, 8,800,000 paper; railways, 10,200,000 paper; posts and telegraphs, 8,600,000 paper; sanitary service, 7,100,000 paper. The principal estimates of expenditure were: Public debt, 23,256,390 gold and 19,179,937 paper; justice and instruction, 28,160,778 paper; army, 18,493,098 paper; navy, 17,088 gold and 14,500,076 paper; public works, 500,000 gold and 21,054,944 paper. The public debt stood on Dec. 31, 1907 at 375,017,815 gold and 664,724,627 paper pesos, consisting of an external debt of 319,512,115 gold, an internal debt of 55,505,700 gold and 98,502,240 paper, a floating debt of 34,064,123 paper, and paper money, 532,158,264 pesos.

ARMY. The army consists of a national militia with compulsory service for all citizens from their twentieth to their forty-fifth year, divided into three periods as follows: 10 years in the active army, 10 years in the national guard, and 5 years in the territorial guard. The period of training in the ranks, however, consists of only one year, and this is only exacted of a small proportion of the contingent, the remainder being excused after three months active training. The infantry is armed with a Mauser repeating rifle, the cavalry with a carbine of the same system, and the artillery with the Krupp 7.5 cm. gun.

The peace strength of the active army in 1908 was 1452 officers and 16,687 men. The war strength of the first line is 170,000, of whom 126,000 have had military training from three

months to two years; of the national guard, 215,000 of whom 90,000 have received some training; the territorial guard, 68,000.

NAVY. The effective navy consisted, at the beginning of 1908, of 3 armored coast defense vessels, aggregating 9100 tons; 4 armored cruisers, 28,300 tons; 4 protected small cruisers, 12,700 tons; 5 destroyers, 1750 tons; 24 torpedo boats, 1110 tons, giving a total of 40 ships and 53,050 tons. The increase in 1907 was 220 tons. The crews numbered 5184. About 2000 naval conscripts are levied annually for two years' service. Argentina advertised during 1908 for bids on two battleships of the Dreadnought type; and 18 destroyers and torpedo boats. This was her answer to Brazil's building programme.

GOVERNMENT. The Constitution of the republic is modelled, in the main, on that of the United States, the provinces of Argentina corresponding in their governmental functions to the States of the Union. The President and Vice-President of the republic are elected for six years by electors representing the provinces. The Senate is composed of 30 members, two from each province and two from the capital. The House of Deputies consists of 120 members, the Constitution providing that there shall be one deputy for each 33,000 inhabitants. The President of the Republic in 1908 was Dr. José Figueroa Alcorta, formerly Vice-President, who assumed office on the death of President Quintana in March, 1906.

HISTORY. Congress met on May 11, 1908. In 1907 Congress had refused to vote the budget, and this refusal was repeated in the special session summoned in November of that year. Thereupon the President, Dr. Alcorta, with the consent of the Cabinet, dismissed Congress, and by extra-constitutional executive decree declared the previous year's budget in force. A few weeks before the meeting of Congress, an unsuccessful attempt was made to kill the President by a bomb. On May 11th the President addressed his annual message to Congress, but it contained little of importance aside from a review of financial and industrial conditions, which were declared to be satisfactory. Among the measures passed by Congress was one for the increase of the navy (August), providing for two battleships of 20,000 tons, and several destroyers. Although the army and navy estimates amounted to \$60,000,000 the Minister of Finance declared that no extra taxes on land were necessary, and that the expenditures could be met from the revenue. In September, Congress authorized the improvement of the port of Buenos Ayres, appropriating \$27,000,000 for that purpose. Earlier in the year an application was made to the government for the grant of 11,000 square miles in the southeastern part of Argentina for German colonization. Immigration during the year appeared to be on the increase. In the first two weeks of November the immigrants landing at the port of Buenos Ayres numbered 17,000, a larger number than ever before within the same period of time.

In 1907 the principal events in foreign affairs had been: The conclusion of a treaty of general arbitration with Italy at The Hague, on September 18th, 1907; the consideration of various treaties with Chile by a special commission named by each government for that purpose; closer and more friendly relations with Paraguay, which joined with Argentina in

a project for dredging Paraguay River and rendering it navigable; the approval of the Postal Convention of Rome; the railway convention with Bolivia, whereby the Northern Central Railway was to be extended into Bolivia and a railway constructed from Potosi to Tupiza; the representation of Argentina in The Hague Peace Conference, the Pan-American Conference and the Jamestown Exposition; and the starting of a movement for holding an international conference at Buenos Ayres in 1910 for the purpose of making the international code uniform. The leading event in foreign affairs during 1908 was the conclusion of a treaty of general arbitration with Brazil, to decide all controversies that the contracting parties should not have been able to settle by direct negotiation. If it was decided to submit a question to an arbitral tribunal, that court was to be constituted as follows: Each government to appoint a member, and to try and agree upon a third; if they failed to agree, the President of the Swiss Republic to be requested to make the appointment.

ARGENTINA ANT. See ENTOMOLOGY.

ARID LANDS. See DRAINAGE; IRRIGATION.

ARIZONA. A Territory of the Southwestern United States. Its area is 113,956 square miles, of which but 116 square miles are under water. The population in 1900 was 122,931. According to Federal estimate the population in 1908 was 150,682. The capital is Phenix.

MINERAL RESOURCES. The chief mineral products of the mines of Arizona are copper, gold, silver, and lead. According to the figures given by the United States Geological Survey, the total value of the mineral products of the Territory in 1907, was \$56,753,650 as compared with a value of \$56,365,889 in 1906. In copper mining Arizona ranks third among the States, being surpassed only by Montana and Michigan. The production of copper in 1907 was 256,778,437 pounds valued at \$51,355,687. This was a slight decrease from the production of 1906, which was 262,566,103 pounds, valued at \$50,675,257. The production of copper shows a remarkable increase over 1900 when it amounted to only 188,317,754 pounds. About one-half this product came from Cochise County. The copper product equals about one-fourth the total output of the United States. In 1907 gold was produced to the value of \$2,664,000 from 128,871 fine ounces. The production of silver was valued at \$1,916,000 from 2,913,000 fine ounces. The other mineral products of the Territory which are as yet relatively inconsiderable are lead, valued in 1907 at \$248,040; stone \$237,110; lime, precious stones, stone, tungsten and zinc. The estimates for the mineral production of the Territory in 1908 indicate an increased copper output over 1907. It is probable too that the production of gold and silver will show a slight increase. Early in the year the smelters which had reduced operations regained their normal output, and later increased it. There were seven active smelters operating in Arizona in 1908. The Bureau of the Mint estimated the gold production of the Territory in 1908 at \$2,344,308. The silver production was estimated to be 3,046,137 fine ounces.

AGRICULTURE AND STOCK RAISING. The area of agricultural land assessed for taxation in Arizona in 1908 was about 1,500,000 acres. The area actually under cultivation is little in ex-

cess of 200,000 acres, the greater part of which is in Maricopa County and the Salt River Valley. Cultivation is carried on largely by irrigation. The acreage, production and value of the principal crops in 1908, according to figures of the United States Department of Agriculture were as follows: Corn, 430,000 bushels, valued at \$454,000 from 13,000 acres; spring wheat, 400,000 bushels, valued at \$480,000 from 15,000 acres; oats, 144,000 bushels, valued at \$107,000 from 4,000 acres; barley, 1,102 bushels, valued at \$1,937,000 from 29,000 acres; hay, 330,000 tons, valued at \$4,026,000 from 103,000 acres. Fruits of all kinds, both temperate zone and sub-tropical, are grown on a small scale in the State. Farm animals on Dec. 31, 1908, numbered as follows: Horses, 110,000; cattle, 663,000; sheep, 4,978,000. The numbers of cattle and sheep have increased notably in the last few years, the increase of sheep being nearly 50 per cent. in three years. The estimated value of the wool shipped in 1908 was \$855,400.

MANUFACTURES. A comparison of those establishments classed as factories, showed that they numbered 154 in 1900, with an average of 3126 wage-earners, and products for the year valued at \$20,438,987, while in 1905 they numbered 169, with 4793 wage-earners, and products valued at \$28,083,192. During this period the capital invested in such establishments increased 51.3 per cent., being \$14,395,654 in 1905. The value of the products of leading industries in 1905 and, in parentheses, the per cent. of increase since 1900, were as follows: Smelting and refining copper, \$22,761,981, or 81.1 per cent. of the total value of all industries (31.6 per cent. increase in value since 1900); railway shop work, \$1,329,308 (49 per cent.); lumber and timber products, \$960,778 (75 per cent.); and flour and grist mill products, \$743,124 (65.8 per cent.). In copper smelting and refining, Arizona ranked fourth among the States in 1905. The manufacture of wooden packing boxes has become of considerable importance.

EDUCATION. The report of the Superintendent of Public Instruction for the year ending June 30, 1908, showed the number of school children between the ages of 6 and 21 years as 34,299, as against 33,169 in 1907. Of these there were enrolled in public schools 26,314, and there were enrolled in high schools 709. There were in the Territory 5,463 children of school age who did not attend any school. The average daily attendance in the public schools was 16,386, as against 15,352 in 1907. The number of school districts in the Territory increased from 293 in 1907 to 301 in 1908. There were in the Territory 431 primary schools, 194 grammar schools, and 8 high schools. In 1908 there were 536 female teachers and 109 male teachers. The average monthly salary of men teachers was \$99.50 and for women teachers, \$75.06. The total receipts for school expenditures in 1908 were \$814,062 as against \$697,762 in 1907. There was expended during the year for public school purposes \$811,473, as against \$620,254 in 1907. In addition, there was expended for the education of the deaf, dumb and blind \$1,650; for the maintenance of the University, \$37,851; for the maintenance of Normal Schools, over \$60,000; and for the erection of buildings at the Tempe Normal School, \$37,284. The total amount expended for education in the Territory in 1908 was \$964,427.90, as against

\$701,102.02 in 1907. The valuation of school property increased from \$1,158,335 in 1907 to \$1,409,788 in 1908. The cost of education per capita of school population was \$18.16 in 1908 as against \$14.50 in 1907. There were in the school libraries in the Territory 26,015 volumes.

FINANCE. The Treasury held a balance of \$365,015, June 30, 1907. The receipts for the fiscal year following were \$828,827.58, and the disbursements \$753,667.50, leaving a balance of \$103,283.68 on June 30, 1908. The chief expenditure during the year was for public school purposes, \$811,473.08. The territorial debt, July 1, 1908 was \$1,012,972, and the city and county indebtedness \$2,100,303. The only provision for the debt at that time was that made in 1907 for the retirement of \$78,000 in 1913. There is also a redemption fund to redeem World's Fair bonds in 1912, amounting to \$30,000. The total value of taxable property in 1908 was \$80,637,541.49.

CHARITIES AND CORRECTIONS. The most important correctional and charitable institutions of the State are the Territorial Prison at Yuma, and the Territorial Reform School at Carson. The Territory has no department of charities and corrections. The Associated Charities of Phoenix does important work.

TERRITORIAL OFFICERS. Governor, Jos. H. Kibbey; Secretary, John H. Page; Treasurer, E. E. Kirkland; Auditor, John H. Page; Adjutant-General, J. H. McClintock; Attorney-General, E. S. Clark; Superintendent of Education, R. L. Long—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Edward Kent; Associate Justices, Richard E. Sloan, Fletcher M. Doan, John H. Campbell, Fred'k. S. Nare; Clerk, Shelby M. Collum—all Republicans.

The Legislature of 1909 is composed of 10 Democrats and 2 Republicans in the Council and 17 Democrats and 7 Republicans in the House. The Congressional representation will be found in the article UNITED STATES, section *Congress*.

ARKANSAS. One of the South Central Division of the United States. Its area is 53,335 square miles of which 810 square miles are water. The population in 1900 was 1,311,564. According to the Federal estimate the population in 1908 was 1,458,246. The capital is Little Rock.

MINERAL RESOURCES. The chief mineral production of Arkansas is coal. According to the figures of the United States Geological Survey, there were produced in 1907 in the State 2,670,430 short tons of a spot value of \$4,473,693. This year was the most prosperous in the history of coal mining in the State. During 1905 and 1906 the coal mining industry of Arkansas was in a very unsatisfactory condition. Since 1903, when the production was 2,229,172 short tons, the output decreased each year until in 1906 it amounted to only 1,864,268 short tons, valued at \$3,000,339. The production in 1907 exceeded that of 1903 by 441,266 tons in quantity, \$1,112,862 in value. With the exception of Michigan the Arkansas percentage of increase in coal production over the previous year was the highest in any of the coal producing States. The decreased production in 1906 was due in part to the suspension of mining operations pending the settlement of the wage question. During a portion of that year nearly all the

mines in the State were shut down, and 3,828 out of a total of 4,298 men employed were idle during the year. In 1907 there were 1,185 men idle for an average of 30 days. The coal mines of Arkansas gave employment in 1907 to 5,085 men and the average production per man was 525 tons in 1907 against 433.8 tons in 1906. Practically all the mines in the State are operated on the basis of the eight hour day. The total original supply of coal in Arkansas was 1,887,000,000 short tons, of which 1,797,000,000 were bituminous and semi-anthracite and 90,000,000 were lignite. The lignite areas have not been developed and no production is reported from them. From the bituminous and semi-anthracite areas there had been mined at the beginning of 1908, 23,756,401 short tons, representing about 2 per cent. of the estimated original contents of the Arkansas field. It is estimated that the production of coal in the State in 1908 decreased between 25 and 35 per cent. from the production in 1907. Other mineral products of the State are bauxite, which was produced in 1907 to the value of 50,267 long tons; clay products, which were produced to the value of \$536,286; iron, lime, and limestone. That diamonds have existed in Arkansas has long been known and systematic search has been made for them for several years. Up to February, 1908 some 140 diamonds had been found in the State, with an aggregate weight of about 200 carats. The largest ones weigh 6½ carats, though the average size compares favorably with the general run of most of the South African diamonds. There is a large proportion of white stone, many of which are free from flaws and are very brilliant. Some of the yellow diamonds are also of exceptional quality and color. According to the figures of the United States Geological Survey, from whose reports the statistics given above are taken, the total mineral production of the State in 1907 was valued at \$6,386,747 as compared with a value in 1906 of \$4,933,899. See COAL, IRON AND STEEL; DIAMONDS.

AGRICULTURE. The acreage, production and value of the principal crops, except cotton, in 1908 were given by the United States Department of Agriculture as follows: Corn, 54,035,000 bushels, valued at \$35,663,000 from 2,675,000 acres; winter wheat, 1,620,000 bushels, valued at \$1,539,000 from 162,000 acres; oats, 3,702,000 bushels, valued at \$1,962,000 from 173,000 acres; rye, 20,000 bushels, valued at \$19,000 from 2,000 acres; rice, 467,400 bushels, valued at \$430,008 from 11,400 acres; potatoes, 2,460,000 bushels, valued at \$2,116,000 from 30,000 acres; hay, 267,000 tons, valued at \$2,896,000 from 198,000 acres. The cotton crop of 1908-9 is estimated at 1,009,000 bales as compared with 796,000 bales in 1907-8. The most notable development in the agriculture of the State during the last few years is the increase in the acreage of corn, which has almost doubled in seven years. Although rice is a comparatively new crop in the State, a considerable area in the southeastern part of the State is devoted to its cultivation. The number of farm animals on Dec. 31, 1908 was reported as follows: Horses, 293,000; mules, 217,000; milch cows, 388,000; other cattle, 674,000; sheep, 253,000; swine, 1,150,000. The number of horses and sheep have remained almost the same for several years. Other cattle have increased consider-

ably, while swine have decreased nearly 30 per cent. during the same period. The estimated value of the wool clip in 1908 was \$214,391.

MANUFACTURES. Though Arkansas is not prominent in manufacturing, very notable progress has been made in this industry since 1900. In the industries covered by the census of 1905 which were comparable with those covered by the 1900 census, there was shown an increase of 82.4 per cent. in the amount of capital invested, of 5 per cent. in the average number of wage earners, of 42.8 per cent. in the amount of wages paid, and of 35 per cent. in the value of products. The value of the products of the six leading industries in 1905, with the per cent. of increase over the value of 1900, were as follows: Lumber and timber products, \$28,065,171 (15.4 per cent.); cottonseed oil and cake, \$4,939,919 (54.7 per cent.); planing mill products, \$3,786,772 (70 per cent.); flour and grist mill products, \$3,702,495 (35 per cent.); railway shop work, \$3,077,537 (49 per cent.); printing and publishing, \$1,443,138 (43 per cent.). Cotton manufactures have not developed to any considerable extent. The number of active spindles in the State increased from 13,844 in 1905 to 14,324 in 1908, and the quantity of raw cotton consumed increased from 3408 bales to 4143 bales during the same time.

EDUCATION. Under a special amendment of the Constitution, the Legislature of 1907 passed a measure providing for an increase in the State school tax from 2 to 3 mills, and for allowing school districts to increase their tax from 5 to 7 mills. A State Normal School was also provided for. This is situated at Conway, and was opened in 1908. According to the statement furnished by the State Superintendent, the total school population (children of ages 6 to 21) June 30, 1908, was 544,519, which was an increase of 10,676 over the figures for 1907. The enrollment for the year was 366,054, an increase over 1907 of 25,872. The average daily attendance was 232,670, an increase over 1907 of 12,049. Nearly 30 per cent. of the school population is colored. The average number of days taught in the public schools in 1908 was 93.9. Although the average number of days increased from 77.4 in 1900 to 88.3 in 1905, this State has still the shortest average period of school days of all the States. The amount expended for public school purposes for the year 1908 was \$2,537,122.42. The number of teachers employed in the State in 1908 was 8,297.

FINANCE. The statement of the State Treasurer showed that the total receipts of the Treasury for the fiscal year of 1908 were \$2,616,164.15, and the total expenditures for the same period were \$2,678,428.29, leaving a balance on Sept. 30, 1908 of \$1,130,344. The principal sources of revenue are the State tax, (28 per cent.); liquor licenses, (8 per cent.); school tax, (40 per cent.). The total State tax rate is $6\frac{3}{4}$ mills, divided as follows: State general revenue, $1\frac{1}{4}$ mills; schools, 3 mills; pensions, $1\frac{1}{2}$ mills; capitol, $\frac{1}{2}$ mill. The State owes no floating or outstanding indebtedness. It has invested \$1,250,500, permanent school funds, in its own bonds, and holds the bonds in trust. The State school fund, which is the common school fund, amounted in 1908 to \$1,018,250.53, or \$1.87 per capita to each child of school age (six to 21 years). The Confederate pension fund, apportioned on Septem-

ber 1, 1908, was \$466,688.50. The State taxes each saloon in the State the sum of \$300 per annum.

CHARITIES AND CORRECTIONS. The State charitable institutions are the Arkansas Hospital for Nervous Diseases, the Arkansas School for the Blind, the Arkansas Deaf and Dumb Institute, the Arkansas State Penitentiary, the Arkansas Federal Soldiers Home, and the Arkansas Reform School, all at Little Rock. In the Arkansas Deaf and Dumb Institute there were in 1908, 325 pupils. Appropriations made by the Legislature of 1907 amounted to about \$187,000. Industrial trades of various kinds are taught the inmates of this institution.

POLITICS AND GOVERNMENT. There was no regular session of the State Legislature in 1908. During the absence from the State of Acting Governor Pindall, A. H. Hamiter, speaker of the House of Representatives, assumed the duties of governor and called an extra session of the Legislature. Governor Pindall immediately returned to his office and issued a proclamation revoking the call. A number of members of the Legislature responded to the call for an extra session, but a majority remained at home in compliance with Governor Pindall's proclamation and as there was not a quorum, no session was held. Several suits were filed during the year against the Waters-Pierce Oil Company, charging violation of the anti-trust law of the State. Certain of these suits were terminated on July 27, when the attorneys for the defendant company paid a compromise penalty of \$10,000. Arkansas, in common with several of the other Southern States, experienced incipient "night rider" manifestations in certain regions. There was apparently no regular organization in Arkansas, but individual efforts were made to intimidate cotton growers and ginners into holding the crop of 1908 for a higher price, principally by the posting of threatening notices. On Sept. 19 the State and the railroad commissioners were enjoined from enforcing the two cent rate law and the commission's freight tariff.

CONVENTIONS AND ELECTIONS. The Republican State Convention met at Hot Springs and on April 28th adopted resolutions directing the delegates to the National Convention to cast their votes for Taft. The administration of President Roosevelt was endorsed. The Democratic State Convention met at Little Rock on June 2, by unanimous vote adopting resolutions instructing for Bryan for President. A notable feature of the Convention was the defeat of Senator Jeff Davis for delegate-at-large to the National Convention. He received only 196 of the 550 votes cast. At the Democratic primary election held on Mar. 26th, George W. Donaghey, Faulkner County, was nominated for governor by a small plurality. At the State election held on Sept. 14, the Democratic candidate, Donaghey, was elected over John I. Worthington, the Republican nominee, by about 60,000 votes. Judge Worthington ran on the State-wide Prohibition platform, while Mr. Donaghey insisted that prohibition was not an issue, but that he would recommend submission of the question to the voters of the State at the next Legislature. An amendment authorizing cities and counties to issue bonds for public improvements was defeated, but a poll tax amendment to the constitution received a safe majority. Several thousand more votes were

cast "against license" (of saloons) than "for license," but each county voted on this question separately, as is done every two years. The State Democratic platform recommended that the question of State-wide prohibition be submitted to the people in 1909, and a bill has been introduced in the Legislature to carry out this recommendation. The vote at Little Rock was double that of 1906, yet the saloon majority was reduced 500. The prohibitionists gained two counties in the State. In the election of Nov. 3, the State vote for the national candidates was as follows: Bryan, 87,015; Taft, 56,624; Watson, 1,121; Debs, 5,750. For governor Donaghey, Democrat, received 111,478 votes, and Worthington, Republican, 45,400.

OTHER STATE EVENTS. During June considerable damage was caused by floods in various portions of the State. In November repeated rises in the Arkansas River caused the bank to cave at Pine Bluff and threatened the destruction of several important buildings. It was found necessary to blow away a point of land on the opposite shore in order that the caving of the banks might be stopped. The blowing away of this point resulted in a diversion of the current and the danger passed temporarily.

STATE OFFICERS. Governor, George W. Donaghey; Lieutenant-Governor, X. O. Pindall; Secretary of State, O. C. Ludwig; Treasurer, James L. Yates; Auditor, J. R. Jobe; Attorney-General, Wm. F. Kirby; Superintendent of Education, Geo. B. Cook; Commissioner of Agriculture, Guy B. Tucker; Commissioner of Insurance, A. E. Moore; Commissioner of Public Lands, L. L. Coffman—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Joseph M. Hill; Justices, Edgar A. McCulloch, C. D. Wood, Burrill B. Battle, and Jesse C. Hart; Clerk of the Court, P. D. English—all Democrats.

The legislature of 1909 is composed of 35 Democrats in the Senate, and 95 Democrats and 5 Republicans in the House. The State representatives in Congress will be found in the section *Congress* in the article UNITED STATES.

ARMIES. See MILITARY PROGRESS, and articles on countries.

ARMÍJO, DON ANTONIO AGUILAR Y CORREA, Marquis de la Vega, de. Former Spanish Premier, and President of the Spanish Chamber of Deputies, died at Madrid, on June 13, 1908. He was born at Madrid on June 24, 1824, studied law, and entered public life in 1855; was a member of the Union Liberal Cabinet of O'Donnell and, was successively civic governor of Madrid, Minister of Public Works and Home Secretary. He was one of the instigators of the revolution of 1868 and was a monarchical member of the Cortes for Cordova; but he became especially well known as Ambassador to France, in which capacity he frequently made himself conspicuous, during the uprising of the Carlists (who were believed to be getting much sympathy from the French Government) by his firm insistence upon the full recognition of Spain at the French capital. Upon the fall of the Moret Ministry in December, 1906, Armijo formed a "Liberal Union" Cabinet which, however, lived only until the 25th of January following, when it was succeeded by the Maura Ministry. See SPAIN.

ARSENIC. The output of arsenic in the

United States in 1907 according to the statistics of the United States Geological Survey was 1751 short tons valued at \$163,000, as compared with 737 short tons valued at \$63,460 in 1906. The American arsenic industry, however, is in comparative infancy as imports amounting to 5164 short tons valued at \$574,998 were required in 1907 in addition to smaller amounts of Paris green, London purple and sheep dips. The principal producing countries of the world are Germany, Spain, Portugal, France, England, Turkey and Canada. The price of white arsenic which varied from 5 to 8 cents per pound in 1907 was considerably less in 1908 ranging from 5.125 cents in February to 3.125 cents at the end of the year. The American production is obtained largely from smelting ores containing arsenic, and in 1907 and 1908 work was done at Carmel, New York, where ore in the form of arsenical pyrites was mined and after the low grade material was concentrated so as to average 25 per cent. arsenic it was shipped to England for reduction. The waste of arsenic in the form of fumes at a single copper smelter in Montana would more than equal the combined production and imports in the United States each year.

ARTILLERY. See MILITARY PROGRESS.

ASBESTOS. See MINERAL PRODUCTION.

ASHANTI. A British colony in West Africa, practically a part of the Gold Coast Colony (q.v.). Area, about 10,000 square miles. Population (1901), about 335,651. Kumasi, the chief town, had 5940 inhabitants in 1905. The products are similar to those of the larger colony, and the imports and exports are included in those of the latter. Gold mining yielded in 1907 a value of £329,892. The Governor of the Gold Coast is also Governor of Ashanti, but the laws and ordinances are distinct from those of the latter.

ASPHALTUM. See MINERAL PRODUCTION.

ASQUITH, HERBERT HENRY. An English statesman, who succeeded Sir Henry Campbell-Bannerman as Prime Minister and First Lord of the Treasury, on April 8, 1908. He was born at Morley, Yorkshire, on September 12, 1852, was educated at Oxford, was called to the bar in 1876, and in 1886 was elected a Liberal member of Parliament for East Fife, which constituency he has ever since represented. His amendment to the Queen's speech in 1892 caused a dissolution of the Salisbury government, and resulted in his appointment as Home Secretary in the Gladstone-Rosebery Cabinet. He arbitrated the London cabmen's strike in 1894 and in that year drew up the Church of Wales disestablishment bill. He was an able and aggressive advocate of free trade as opposed to Mr. Chamberlain's preferential tariff programme in 1903, and in December, 1905, upon the dissolution of the Balfour ministry became Chancellor of the Exchequer in the Campbell-Bannerman Cabinet. During his premiership he advocated old age pensions (proposed by him in May, 1907), the "licensing" and "education" bills, and other important measures and policies. See GREAT BRITAIN, paragraphs on *History*.

ASSEMBLY, GENERAL. See PRESBYTERIAN CHURCH IN THE UNITED STATES OF AMERICA; and PRESBYTERIAN CHURCH IN THE UNITED STATES.

ASSOCIATED PRESS. An organization whose purpose is the collection and distribution of news. It was first incorporated in Michigan, later in Illinois and in 1900 in New York. The Associated Press has its own leased wires, which form a network covering the continent. The officers in 1908 were: President, Frank B. Noyes; First Vice-President, Charles Hopkins Clark, *Hartford Courant*; Second Vice-President, Rufus N. Rhodes, Birmingham, Ala.; Secretary, Melville E. Stone; Assistant Secretary, Charles S. Diehl; Treasurer, Herman Ridder.

ASSOCIATE REFORMED SYNOD OF THE SOUTH. A religious denomination, organized in 1803. It was connected until 1822 with the General Synod. The denomination in 1908 included about 12,600 communicants, 120 churches and 115 ministers. The denomination has churches in every Southern State and carries on mission work in Mexico. Its educational institutions are Erskine College, Erskine Theological Seminary and Due West Female College, all at Due West, South Carolina.

ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, BRITISH. A learned society, founded at York, England in 1831 for the purpose of stimulating scientific inquiry and for promoting the intercourse of scientific men. The Association meets annually for one week in some large provincial town, but never in London. The meeting for 1908 was held for the fourth time in Dublin, with an attendance of 2270. The presidential address, delivered by Dr. Francis Darwin, considered the movements of planets. The Association includes eleven sections as follows: Mathematical and Physical; Chemical; Geological; Zoölogical; Geographical; Economic Science and Statistics; Engineering; Anthropology; Physiology; Botany; and Education. Among the notable addresses delivered at the meeting were those of W. N. Shaw in the Mathematical and Physical section, discussing the functions of the State Meteorological Department; Professor F. S. Kipping in the Chemical section, dealing with the question as to whether any steps can be taken to place the chemical industries of Great Britain and Ireland in a more prominent position than that which they now occupy in the world of commerce; Professor John Joly of the Geological section, discussing uranium and geology; Mr. W. M. Acworth, in the Economic Science and Statistics section on the Relation of Railroads to the State; Professor C. L. Miall in the Educational section, discussing useful knowledge, and Professor B. Moore, in the same section, on the Correlation of Primary, Secondary, and University Education in Ireland. The Association will hold its next meeting at Winnipeg, Canada, on Aug. 15, 1909, under the presidency of Professor Sir J. J. Thompson. The officers in 1908 were, President, Dr. Francis Darwin, F. R. S.; General Secretaries, Major P. A. Macmahon, F. R. S., and Professor W. A. Herdman, F. R. S.; Assistant Secretary, A. Silva White.

ASSOCIATION OF AMERICAN AGRICULTURAL COLLEGES AND EXPERIMENT STATIONS. See AGRICULTURAL EXPERIMENT STATIONS.

ASSOCIATION OF AMERICAN UNIVERSITIES. An organization founded in 1900 for the purpose of considering matters of common interest relating to graduate study in American institutions. Its membership in 1908

consisted of the following eighteen universities: University of California; Catholic University of America; University of Chicago; Clark University; Columbia University; Cornell University; Harvard University; Johns Hopkins University; University of Illinois; Leland Stanford Jr. University; University of Michigan; University of Minnesota; University of Missouri; University of Pennsylvania; Princeton University; University of Virginia; University of Wisconsin, and Yale University. The Ninth Annual Conference of the Association was held on Jan. 9th and 10th with the University of Michigan. The Association adopted as a condition for membership the presence in the institution in question of a strong graduate school, and in those institutions which have professional schools in addition to the Graduate Department, the requirement in at least one such school of one or more years of college work as a prerequisite for admission to professional courses, the combination to be so arranged that no professional degree shall be given until the satisfactory completion of at least five years of study. This action was important, since it for the first time defines what an American university is from the standpoint of fifteen of the most important of them, and it places all professional study in America in such institutions ultimately upon a graduate basis in that it is proposed in due time to require that all professional work shall be preceded by college work in the manner indicated. At this meeting, three institutions, the State Universities of Illinois, Minnesota, and Missouri, were admitted to membership in the Association. The officers of the Association for the year are: President, University of Michigan; Vice-President, Leland Stanford Jr. University; Secretary, Harvard University; additional members of the executive committee, Cornell University and Columbia University. The next annual meeting of the Association will be held at Cornell University on January 7th and 8th, 1909.

ASSUR, EXCAVATIONS IN. See ARCHÆOLOGY.

ASTEROIDS. See ASTRONOMY.

ASTOR LIBRARY. See NEW YORK PUBLIC LIBRARY.

ASTRONOMY. The year 1908 was chiefly noticeable for the discovery of a new satellite of Jupiter and the announcement of the probable existence of another large planet lying beyond the orbit of Neptune. Comets and minor planets, variable and double stars, received their usual share of attention. Mars, Jupiter and Saturn again were under observation, and our knowledge of the sun has received notable additions through the researches of Professor Hale and others. The Carnegie Institution at Washington established a new observatory in the southern hemisphere, located at San Luis, about 500 miles west of Buenos Ayres, for the purpose of making meridian observations of all the stars of the southern hemisphere brighter than the seventh magnitude, and any others which Lacaille included in the celestial survey which he made at the Cape of Good Hope in 1750.

THE SUN. The total eclipse of Jan. 3, 1908, was observed by American and English parties on Flint Island in the Southern Pacific. The American expedition was fitted out by the Lick Observatory; the English expedition was due to the initiative and munificence of Mr. Frank McClean. Although heavy rain fell until totality,

the sky cleared, and both parties were able to secure a fine series of photographs of the corona. In addition, the Lick observers obtained a number of photographs of the spectrum. The eclipse was noticeable for the large number of long narrow streamers in the corona, about thirty extending to a distance of more than one solar diameter, and about half of these to one and a half diameters. The photographs of the spectrum showed a shifting of the great intensity of the continuous spectrum towards the red, thus indicating the lower temperature of the corona as compared with that of the photosphere. Several new bright lines were detected. Search was also made for an intra-mercurial planet, but no results were obtained. Perrine, who carefully examined the plates, concluded that no such planet of sufficient magnitude exists as will account for the anomalies of the perturbations of Mercury. Successful bolometric measurements of the heat of the corona were also made.

Professor Hansky published a discussion of the results obtained from a study of the corona photographs taken at Alcocébre (Spain) by the Pulkowa expedition during the total solar eclipse of Aug. 30, 1905. The principal object of the photographs was to determine the velocity of the propagation of the coronal matter. The corona was of the "maximum" type, showing intense activity all round the disc. The streamers were arranged in eight groups. Professor Hansky finds that the centres of emission, though often near sun spots, do not coincide with them. The form and direction of a streamer is apparently to some extent dependent on the prominence above which it is found. The velocity of the coronal clouds above prominences was small, not exceeding 30 kilometers per second, while that of the matter at the prominences themselves often approached 300 kilometers per second.

During the year 1908, two estimates of the temperature of the sun were published, both considerably in excess of the value determined by Fery and Millochau and referred to in the *YEAR BOOK* for 1907. In *Annalen der Physik*, Goldhammer, from a discussion of Langley's observations arrives at the conclusion that the probable actual temperature of the sun is not less than 10,000° absolute. In the *Bulletin of the Philosophical Society of Washington*, Lummer considers that the temperature may, with reasonable assurance, be assumed to be about 7,000° absolute. He discusses the probable nature of the solar envelope, and finds that the broadening of the vortex. Such a field of force would affect lines in the prominences, and other spectral phenomena, can be explained by anomalous dispersion in the various layers of the sun's atmosphere. This was also the view held by Professor Julius of Utrecht, who devised laboratory experiments which supported his conclusions in a striking manner. According to Lummer and Julius, the chromosphere and prominences, faculae and flocculi, have no objective reality, the bright lines of their spectra being merely due to the light of the photosphere which is brought to us by anomalous dispersion through layers of non-homogeneous gases. Astronomers, however, hesitate to admit the validity of their arguments, and preparations were being made at Mt. Wilson Solar Observatory to put these theories to a thorough test.

It is well known that the meridian passage of large sun spots is often attended by sudden vari-

ations of the terrestrial magnetic elements, and to account for this phenomenon, it has been supposed that the spots were regions of magnetic force, but no strong evidence of this explanation has hitherto been forthcoming. Photographs of spots taken during June and July with the spectroheliograph of the Mount Wilson Solar Observatory, using the hydrogen line H α showed unmistakable evidence of strong cyclonic motion. Professor Hale, discussing these photographs in *Contributions from the Mount Wilson Solar Observatory*, suggested that a segregation of positively or negatively charged particles rotating in a solar vortex would give rise to magnetic lines of force at right angles to the plane of the vortex. Such a field of force would affect the light proceeding from the spot along the lines of force, and would produce the doubling of the spectrum lines, with components circularly polarised in opposite directions, which is known as the Zeeman effect. A later series of photographs, taken for the purpose of testing this supposition, confirmed it in every particular, the doubling of the lines being very marked. It was evident that the way was open for a systematic comparison of the solar and terrestrial magnetic fields, which should lead to definite advances in the field of terrestrial magnetism. See under *PHYSICS* paragraph on *Magnetic Field of Sun Spots*.

Professor Charles Lane Poor, of Columbia University, has published an account of his researches on the figure of the sun. He concludes that the commonly accepted belief that the sun is a sphere is not warranted, and finds indications of a fluctuation of the sun's shape corresponding with the 11-year sun spot and aurora periods, with possibly a minor fluctuation with a 28-day period.

SUN SPOTS. During most of the months of the year 1908, the solar surface was free from any marked disturbance, and it would seem as though the decline in solar activity which apparently began in 1906, only to be checked by a renewed outburst in 1907, had at last definitely set in. At no time during the year was there any large individual spots rivaling those of 1905 and 1907, but on several occasions large groups of spots appeared, some of them covering more than a billion square miles of the sun's surface. One of these made its appearance at the end of May, and lasted for more than a week. About the beginning of August, two enormous groups of spots were seen. The more southerly, starting as a few small spots, increased rapidly in size, and in a week had attained a length of more than 100,000 miles. Both groups reappeared at about the end of the month, the more northerly having increased enormously, until its area was more than two billions of square miles. This group again appeared about the end of September. It was then much smaller, but was still visible to the naked eye. Other large groups were noticeable in November.

SATURN. In January, 1908, as in October, 1907, the plane of Saturn's rings passed through the earth. On this occasion, the rings apparently were completely invisible, although the shadow on the planet's disc was quite noticeable. As an explanation of the bright knots observed by Professor Campbell in October, 1907, Lowell advanced the theory that the rings were not flat sheets, but were really flattened torus. The central portions of the rings would thus

be invisible, but, on both sides of the planet, where the depth of each ring in the line of sight is considerable, there would be presented the phenomena seen by Campbell.

Towards the close of the year, announcement was made from the Geneva Observatory of the discovery of a new dusky ring surrounding the bright rings, but confirmation was lacking.

JUPITER. On Feb. 28, Mr. Melotte, one of the assistants at the Greenwich Observatory, while engaged in measuring some photographs of the sixth and seventh satellites of Jupiter taken at Greenwich on Jan. 27, discovered near the planet a small object, which at first was supposed to be a new asteroid and received the temporary designation 1908 CJ. Subsequent examination by various observers soon made it clear that the body was another member of Jupiter's family of satellites. The new satellite was the faintest and most distant of Jupiter's satellites yet discovered. Its orbital motion was retrograde, and, according to its most recently published elements, its period of revolution was about two and a quarter years.

Professor Barnard, in a brief note in *Astronomische Nachrichten*, has published a discussion of the observations of the Great Red Spot which he had made during the previous thirty years. In 1879, he found that the spot exerted some peculiar repellent action on the matter of the South Equatorial Belt, forming what is known as the Red Spot Bay. In 1885 and 1886, the bay was very distinctly noticeable, the material of the equatorial belt north of, and following, the spot being repelled to form the large depression of the bay. In 1908, the spot had become greatly enfeebled and had almost lost all color, but the repellent action seemed to have lost none of its intensity. The material of the equatorial belt had flowed round the spot so that it completely surrounded it, but between the two the bay was still as noticeable as ever.

MARS. One of the strongest arguments against the possibility of Mars being habitable has been the failure to detect with certainty the presence of water vapor in the atmosphere of the planet. This was made the chief text of Dr. Alfred Russell Wallace's *Is Mars Habitable?* in which he subjected to critical examination the arguments presented by Professor Lowell in his recent work, *Mars and Its Canals*. Since the publication of these two works, Mr. Slipher, one of the assistants at the Lowell Observatory at Flagstaff, Arizona, has succeeded in photographing the lines due to water vapor in the atmosphere of Mars. He made use of plates sensitive to the extreme red rays, which with prolonged exposures were capable of photographing the spectrum in the neighborhood of the α band, the most intense of the absorption bands due to water vapor. Photographs of the spectrum of Mars showed this band clearly, while in the spectrum of the moon taken on the same plate it was absent, proving that the effect was not due to water vapor in the terrestrial atmosphere.

JOVIAN ASTEROIDS. In the YEAR BOOK for 1907, mention was made of the discovery of three minor planets, which have been named Achilles, Patroclus and Hector. These minor planets are interesting from the close association of their orbits with that of Jupiter. During the year 1908 another member, designated 1908 CS, was added to this group of Jovian asteroids.

Various suggestions were made as to the origin of the satellites of Jupiter, one being that the eighth satellite was the celebrated comet of Lexell, with a period of five and a half years, which was last seen in 1770. In 1779, this comet approached within a million miles of Jupiter, and may have been drawn into the Jovian system. A more plausible conjecture, however, was that of Professor Tarrida del Marmol, who is of opinion that the sixth, seventh and eighth satellites of Jupiter may have originally formed part of the Jovian group of asteroids and may have at some time been captured by the planet.

VARIABLE STARS. It had been recognized for some years that there was an intimate connection between the colors and periods of variable stars. Herr Beljowsky, of the Göttingen Observatory, contributed to the *Astronomische Nachrichten* an interesting study of this question. Making use of Pickering's second Catalogue of Variable Stars, in which the color data of about 300 stars were given, he found that in general the average color ranged from white, through yellow and orange, to red with an increase of period. The only break in the continuity of the sequence was in the case of stars whose period was 200-250 days, which was more yellow, than those whose period was 100-200 days. The relation between color and period was more strikingly shown when all stars brighter than magnitude 5 and fainter than magnitude 9.5 were excluded from consideration. When the stars are grouped according to declination, it is found that the average color and period of stars in different zones remain practically constant, while, grouped according to magnitude, the brightest stars are found to be the reddest.

STELLAR SPECTRA. In a short note in *Astronomische Nachrichten*, Professor W. H. Pickering suggests the establishment of a new type of stellar spectra in addition to the five types already recognized. Under this sixth type, he would classify a number hitherto placed under the fourth type, but containing rays of much shorter wave length than the ordinary members of this group, peculiar spectra and spectra containing dark bands. A list of 51 stars which conform to the type and almost all of which were determined from the Harvard photographs is given.

COMETS. The periodic comets due to return in 1908 were Giacobini's (1900, III), Denning's (1881, IV), Encke's (first observed in 1786) and Tempel-Swift's (1869 III). The year passed without the detection of the first two, the periods of which are 7 and 8.8 years respectively. Denning's comet was also missed in 1890 and 1908-9, its position at those returns being unfavorable for observation. Encke's comet has been observed at every reappearance since 1819, when its periodic character was first recognized. This year proved to be no exception; it was first noticed by Woodgate at the Cape Observatory on May 27. Comet Tempel-Swift, first observed by Tempel at the end of 1869, and recognized as periodic by Swift in 1880, has a period of about 5.5 years. It was well observed in 1891, but was not detected at either of its last two reappearances, in 1897 and 1903. This year, it was discovered by Javelle at Nice on Sept. 29. Comets Encke and Tempel-Swift are designated 1908b and 1908d respectively.

Two other comets were also discovered. These were: 1908a, a comet discovered by Wolf at Heidelberg on Jan. 2, and on account of its position, at first identified as Encke's. It had previously been photographed on Dec. 25, 1907, but had been overlooked at the time. It soon became evident from the differences between the observed positions and those of the published ephemeris that it was not Encke's comet. Dr. Backlund, director of the Pulkowa Observatory, suggested that possibly Encke's comet had divided itself into two parts, and that this part had been deflected, by the process of dislocation, from its original orbit. Some weight is lent to this explanation, as the true Encke, when discovered, was at some distance from the predicted position, though its motion in right ascension agreed with that given in the ephemeris.

1908c. A new comet discovered photographically by Morehouse at the Yerkes Observatory on Sept. 1. When first observed it possessed a long, continuous tail. Visually, it consisted of a diffuse nebulous mass with a not very distinct tail. It rapidly grew brighter, and, towards the end of September, became just visible to the naked eye. The tail at this time was double and about 40 minutes in length. On Oct. 1 the tail had disappeared, although it was detected again on Oct. 3 when it was shorter than before. During October, the tail underwent a series of startling changes, apparently due to the fact that the comet, in its journey through space, had encountered a number of meteor streams of different densities. At one time the tail had a large bright condensation at some distance from the head. This condensation, which, on Oct. 15, was 360,000 miles from the head, was travelling with accelerated motion at the rate of about 9 miles per second, and, on Oct. 16, was nearly a million miles from the head. A narrow stream of luminous matter connected it with the head, while from it proceeded numerous streamers forming a fan-shaped tail. Other condensations appeared, which gave the comet the appearance of having sloughed its tails.

MINOR PLANETS. Again, the number of minor planets announced as new during the year 1908 exceeds the century, and, as usual, the credit for their discovery rests chiefly with Prof. Max Wolf, of the Heidelberg Observatory, and his assistants, and Rev. Joel Metcalf of Taunton, Mass. The number announced was 120, exceeding by fifteen the total for 1907, and falling short of the total for 1906 by eight only. Of these 103 were discovered during the year. They have been provisionally designated by letters ranging time BM to FK, with the additional letters CE^a, CL^a, DO^a, and DT^a. Sixty-seven of these were first announced from Heidelberg by Wolf (10), and his assistants, Kopff (52), Lorenz (4), and Scheifele (1). One of those announced by Wolf (EA, discovered on Sept. 21) had, however, been found on the previous day by Metcalf, and another (FH, discovered on Dec. 31) was said to be doubtful. Of the remaining 36 discovered during 1908, 30 were due to Metcalf (Taunton, Mass.), 2 to Melotte (Greenwich), 2 to Palisa (Vienna), 1 to Davidson (Greenwich), and 1 to Hirayama (Tokyo). Several were identified previously discovered asteroids and it was thought that more would prove to be the same as known bodies when their orbits had been determined with suf-

ficient accuracy. CJ, discovered by Melotte on Jan. 27, proved to be an eighth satellite of Jupiter, as already mentioned.

Besides the minor planets enumerated above, there were seventeen others, discovered in previous years, but only recently identified. One of these OV^a was found by Barnard as long ago as 1904, but was thought at the time to be Phœbe, the then recently discovered ninth satellite of Saturn. The remaining sixteen, designated by letters ZW^a to ZW^d, AF^a=AN^a, to AN^k, BJ^a were discovered by Metcalf in 1907, but their identification was overlooked at the time on account of their discoverer's illness.

During the year 1908, the following minor planets received permanent numbers, ranging from 636 to 659:

1907 XP (=636); YE (=637); ZQ (=638), ZT, ZW, ZX, ZY, ZZ; AA (=644), AB, AC, AD, AE, AF, AM, AN, AU; BK (=653).
1908 BM (=654), BS, BU, BV, BW; CS (=659).

AU (=652) and BM (=654) are the only two planets which have received names during the year. They have been named *Jubilatrix* and *Belinda* respectively.

BM, the first discovery of the year 1908, was the brightest minor planet which had been discovered for some years. Its brightness was estimated at about 9.5. CS belongs to the Achilles group of asteroids which travel in orbits near that of Jupiter. See subheading *Jovian Asteroids*.

EXTRA-NEPTUNIAN PLANET. During December, Professor W. H. Pickering of the Harvard Observatory announced that, as the result of an investigation, a preliminary notice of which was communicated to the American Academy of Arts and Sciences in November, he had obtained evidence of the existence of a planet lying beyond Neptune. Its position was indicated for 1909 as in right ascension 7 hr. 47 min. and declination 21° North.

SYSTEMATIC MOTIONS OF THE STARS. In 1905, Professor Kapteyn pointed out that the stars surrounding us form a dual system. From a consideration of the motions of the stars of Bradley's catalogue, numbering about 2600, he was able to demonstrate the existence of two great streams of stars of nearly equal importance, in motion relative to each other and to the sun. There are, therefore, two regions of the sky where the stellar density tends to increase, and not one, as had formerly been the generally accepted opinion. Two years later, Eddington extended Kapteyn's researches to include the motions of the stars given in the catalogues of Groombridge and Carrington. These stars are confined to a region within 52° of the north pole. Their number is considerably larger than that considered by Kapteyn, being over 5000. They also include a much larger proportion of faint stars. Each of the zones embraced in these two catalogues was divided into more restricted regions, and for each region was constructed a curve in which the radius vector in a given direction is proportional to the number of stars whose motion is in that direction. If there existed only one stream of stars, each curve ought to possess a single maximum radius vector. Almost all of the curves, however, had two pronounced maxima, and could be decomposed into two simple curves, thus confirming Kapteyn's views. When the pairs of maximum radii were exam-

ined it was found that they could be separated into two groups, the members of each of which converged almost exactly to the same point of the sky. The two streams appear to be almost equivalent in point of numbers, distribution, distance, brilliancy and the character of their spectra. One of the streams, however, has much more pronounced maxima than the other, indicating that its velocity is between three and four times as great as that of the other streams.

During the year 1908, these researches still further were extended by Professor Dyson, the Astronomer Royal of Scotland, in the *Proceedings of the Royal Society of Edinburgh*. He chose only stars of large proper motion—about from 20 to 80 minutes per century—well distributed over the heavens. Of the 1100 stars considered, about 160 were situated within 52° of the north pole, about the same number were within 50° of the south pole, while the remainder were distributed over a belt 30° N. and S. of the equator. The effect of the exclusion of the stars of small proper motion is to bring out more strongly the character of the two streams, at the same time eliminating to a large extent the effects of errors of observation. This is noticeably the case with the stars of Stream II.

The positions of the apices of the two streams, as determined in the three discussions, are shown below:

	Stream I.		Stream II.	
	R. A.	Decl.	R. A.	Decl.
Kapetyn	85°	11° S	260°	48° S
Eddington	90°	19° S	292°	58° S
Dyson	94°	7° S	240°	74° S

HALLEY'S COMET. This famous comet, the return of which is expected in 1910, has been the subject of an extended research by Messrs. Cowell and Crommelin of the Greenwich Observatory. The object of the research was twofold, first, to determine with the necessary accuracy the date of the comet's perihelion passage in 1910, and second, to trace backwards the course of the comet and to identify its several returns. In his calculations of the date of return, Pontécoulant failed to take into account the perturbations due to Jupiter and Saturn. These combine to advance the date of perihelion passage, and the date now set is April 8, 1910. On May 12, the comet will be nearest the Earth. Hind traced back the returns of the comet to B. C. 12, identifying it at each appearance with some notable comet recorded in Chinese or European annals. Of these, perhaps the two most famous appearances were those of 1066 and 1456. In the former year it caused universal consternation throughout Europe, and was looked upon as a presage of the success of the Norman invasion of England. One celebrated record of its appearance at that time is to be seen in the Bayeux Tapestry, which is supposed to have been worked by Matilda, the Queen of William the Conqueror, and her ladies. Three years before the second of these appearances, Constantinople had fallen into the hands of the Turks, whose conquest of Europe seemed then to be assured, and the comet was held to be the forerunner of greater woes. The tail

of the comet at this time was nearly 70 degrees in length, making it a magnificent spectacle. Cowell and Crommelin find that Hind's identifications are in the main correct, the only errors being in the case of the apparitions of 608, 837, 912, and 1223. In the last case, their calculations give 1222 as the date of return. This was the date of a comet recorded by the Chinese, and also mentioned in European records. The records, however, are conflicting, but it is found that a satisfactory identification is obtained by accepting the Chinese records as they stand, and by making a change in the interpretation of the European records. The calculations have been carried back beyond the earliest date of Hind's identifications, and the return of B. C. 87 has been identified with fair certainty, that of B. C. 240 with some probability, while a comet which appeared in B. C. 467 is pointed out as being possibly identical with Halley's. At this point the enquiry into the past history of the comet is brought to a complete standstill through lack of earlier observational material.

MOUNT WILSON SOLAR OBSERVATORY. The tower telescope of the Mt. Wilson Solar Observatory has been completed. It consists of a tower 65 feet in height on the summit of which is mounted a cælostæt and a second mirror, which receive the rays of the Sun and reflect them vertically downward through a horizontal objective 12 inches in diameter placed just below the mirror. The focal length of the objective is 60 feet, and an image of the Sun six and a half inches in diameter is formed near the level of the ground, where it enters the slit of a Littrow grating spectrograph of 30 feet focal length. This stands in a deep well with concrete walls, constructed in the ground immediately below the tower. The telescope is to be used in investigating the peculiarities of the solar disturbances such as the sun spots and the coronal streamers. Among the novel features introduced in this instrument may be mentioned the extremely thick mirrors for the purpose of reducing the distortion due to the sun's rays, and the subterranean spectroscope chamber which is practically constant in temperature. Preliminary tests show that the telescope gives superior definition to the Snow telescope.

BOOKS. Among the more important works published during 1908 may be mentioned the following: Hale, *Study of Stellar Evolution*; Poor, *The Solar System*; Dolmage, *Astronomy of To-day*; Arrhenius, *Worlds in the Making*; Wallace, *Is Mars Habitable?* Hagen, *Atlas Stellarum Variabilium*, 6th Series.

ATHENS, EXCAVATIONS IN. See **ARCHÆOLOGY.**

ATHLETICS, TRACK AND FIELD. The thirty-third annual track and field contests of the Intercollegiate Amateur Athletic Association of America were held in Philadelphia on May 29 and 30, 1908. The contestants were greatly handicapped by rain and mud, and the only new records established were in the 120-yard hurdles and in the pole vault. A. B. Shaw, of Dartmouth, in the preliminary trial, ran the 120-yard hurdles in 15 1/5 seconds, equalling the world's record, made by A. C. Kraenzlein in 1898, and breaking the intercollegiate record of 15 2/5 seconds, held by the same athlete since 1889. In the pole vault, Dray, Nelson and Gilbert, of Yale, and Cook, of Cornell, tied

at 12 feet, excelling the previous intercollegiate mark of 11 feet $11\frac{3}{4}$ inches, made by Dray in 1907. Cornell won the meet with a total of 34 points. The number of points scored by other colleges was: Pennsylvania, $29\frac{1}{2}$; Yale, 22; Harvard, $17\frac{1}{2}$; Dartmouth, 17; Michigan and Swarthmore, 6 each; Princeton, 4; Syracuse, 3; Columbia, 2. The fourteenth annual athletic carnival of the University of Pennsylvania was held on April 25. The only record broken was in the pole vault, which was won by Dray, of Yale, with a vault of 12 feet $6\frac{1}{2}$ inches. The two-mile relay was won by Michigan and the one-mile relay by Pennsylvania.

The University of Chicago won the Western intercollegiate meet, held at Chicago on June 6, scoring 24 points. The standing of the remaining colleges was: Leland Stanford and Wisconsin, 20 points each; Illinois, 18 points; Grinnell, 8 points. In the dual meet between Yale and Harvard, held at Cambridge on May 16, several new collegiate records were made. Roberts, of Yale, ran the 120-yard hurdles in 15 1-5 seconds; Gilbert, of Yale, vaulted 12 feet $3\frac{3}{4}$ inches; Stephenson, of Harvard, put the 16 lb. shot 43 feet $\frac{1}{2}$ inch; and Witcher, of Harvard, ran the half-mile in 1 minute 58 $\frac{3}{5}$ seconds. The final score was Yale, 60 $\frac{1}{5}$; Harvard, 43 $\frac{4}{5}$. The results of other dual meets, held during the year, were: Yale, 73; Princeton, 31; Harvard, 68; Dartmouth, 49; Cornell, 80; Princeton, 37.

The championship games of the Amateur Athletic Union took place at Travers Island, N. Y., on September 18 and 19. No new records were made in the junior events, which were won by the Irish-American A. C., with a total of 35 points. Other scores were: N. Y. A. C., 31; Brookline M. G. T. T., 11; Montreal A. A. A., 9; Swedish-American A. C., 8; Pastime A. C., 7; Mercury A. C., 5; Chicago A. A., and Acorn A. A., 4 each. In the senior contests the Irish-American A. C. won 6 events; N. Y. A. C., 5; Chicago A. A., 2; and the Olympic A. C., and the Montreal A. C., 1 each. The national all-round championship of the American Athletic Union, held at Long Island City on September 7, was won by John Bredemus, of Princeton University, who scored a total of 5809 points in ten events. J. Mahoney, of the N. Y. A. C., was second with 5321 points. The record is 7130 $\frac{1}{2}$ points, made by Martin Sheridan in 1907. J. J. Eller, of the Irish-American A. C., ran the 220-yard hurdles in 24 $\frac{4}{5}$ seconds, establishing a new record. See OLYMPIC GAMES.

ATOM. See PHYSICS.

ATOMIC WEIGHTS. See CHEMISTRY.

AUSTRALIA, COMMONWEALTH OF. The area and population, exclusive of aborigines, of the Commonwealth of Australia are shown in the following table, by States:

	Area sq. miles	Population 1901	Pop. Dec. 31, 1907
New South Wales ..	310,872	1,359,341	1,571,267
Victoria	87,884	1,201,133	1,258,140
Queensland	670,500	503,266	546,467
South Australia....	903,690	362,604	396,028
Western Australia .	975,920	184,124	263,846
Tasmania	26,215	172,475	181,624
Commonwealth	2,974,581	3,782,943	4,217,372

In 1907, the population consisted of 2,232,997 males and 1,984,375 females.

The marriages, births, and deaths in 1907, and their rates per 1,000 mean population, are shown in the following table:

	Marriages		Births		Deaths	
	No.	Rate	No.	Rate	No.	Rate
N. S. Wales.....	12,189	7.84	42,195	27.14	16,410	10.56
Victoria	9,575	7.68	31,369	26.16	14,542	11.66
Queensland	4,105	7.58	14,542	26.87	5,599	10.35
S. Australia	3,079	7.94	9,236	23.82	3,828	9.87
W. Australia	2,114	8.02	7,711	29.24	2,924	11.09
Tasmania	1,411	7.91	5,291	29.68	2,001	11.22
Commonwealth ..	32,473	7.78	110,344	26.45	45,304	10.86

The number of arrivals and departures by land and sea in 1907 is shown in the following table, the excess of arrivals over departures giving approximately the number of immigrants:

	Arrivals	Departures
New South Wales	225,742	204,306
Victoria	99,416	96,153
Queensland	61,927	57,504
South Australia	76,766	69,181
Western Australia	22,012	23,523
Tasmania	34,803	32,557
Commonwealth	520,666	483,223

The population of the capital cities, as estimated at the end of 1907 is as follows: Sydney, N. S. W., 550,600; Melbourne, V., 538,000; Brisbane, Q., 135,655; Adelaide, S. A., 178,300; Perth, W. A., 50,380; Hobart, T., 35,685. In 1908, the seat of the Commonwealth Government was at Melbourne. The choice of a district for the federal capital was made towards the end of the year 1908, and the Yass-Canberra district, in New South Wales, 193 miles southwest of Sydney and 395 miles from Melbourne, was selected by the Federal Parliament.

IMMIGRATION. In 1908, arrangements were made with the Italian government for the introduction of Italian agriculturists into Western Australia. Land is to be assigned to them contiguous to the railways, and settlement is to be made on one side of the line only, it being intended to have British settlers on the other side to prevent exclusiveness. Arrangements are to be made with an agricultural bank for advancing money to the settlers, and schools for teaching English, as well as religious and medical needs, are to be provided by the State government until such time as the settlers will be able to undertake such responsibilities on their own account. The immigrants will pay a small rent for 18 years, at the end of which period they will become freehold owners. An experiment was first to be made with 100 families.

EDUCATION. Education is entirely under the control of the separate States. In New South Wales instruction is compulsory between the ages of 6 and 14. School fees were abolished in Oct., 1906, and education is now free. In 1907, the State primary schools had 5,745 teachers and 276,037 pupils, with an average

attendance of 152,607. Other State schools, including evening schools, high schools, etc., and private schools, had 3,625 teachers and 65,326 pupils. Of the private schools, the Roman Catholic schools had 1,871 teachers and 42,106 pupils in 1906. The University of Sydney, with about 1,050 students, receives an annual subsidy from the State. The Technical College, with numerous branch schools, had 15,594 students in 1906.

In Victoria, primary secular education is free and compulsory between the ages of 6 and 14. In 1907, the State primary schools had 4,721 teachers and 231,759 pupils, with an average attendance of 147,270. The State offers no secondary education, but there may be awarded annually 80 scholarships, each tenable for three years. Private schools had in 1907, 2,313 teachers and 147,270 pupils, about half the pupils being in Roman Catholic schools. There were under the Education Department three working men's colleges, five schools of arts, nine schools of mines, two agricultural and one horticultural colleges. The University of Melbourne, with about 900 students, receives aid from the State. Affiliated with it are an Anglican, a Presbyterian, and a Wesleyan college, and the School of Mines at Ballarat.

In Queensland, primary secular education is free and legally compulsory. In 1907, the State primary schools had 2,394 teachers and 105,382 pupils, with an average attendance of 66,849.

The State also maintains a number of secondary schools and grants annually a considerable number of scholarships, tenable for three years. There are a number of institutions giving technical instruction outside working hours, with about 4,300 students. Private schools had in 1907, 753 teachers and 15,385 pupils. In South Australia, secular education is free and compulsory. In 1906, the State primary schools had 1,429 teachers and 62,822 pupils, with an average attendance of 40,308; private schools had 722 teachers and 10,570 pupils. The State grants a number of scholarships, tenable through college and university. There are several denominational secondary schools, a training college for teachers, etc. The University of Adelaide, endowed by the State with considerable tracts of land, has about 700 students. In Western Australia, primary education is compulsory. In 1906 the State primary schools had 973 teachers and 28,927 pupils, with an average attendance of 24,973; private schools had 263 teachers and 7,515 pupils. In Tasmania, primary education is compulsory. In 1906, the State primary schools had 546 teachers and 24,221 pupils; private schools had 8,833 pupils. There are two technical schools, two schools of mines, and an examining and degree-conferring university. The State grants several scholarships.

MINERALS. The value of the mineral production in 1907 is shown in the accompanying table.

MINERAL PRODUCTION, 1907.

	Gold	Silver	Copper	Tin	Coal	Others	Total
N. S. Wales....	£1,060,730	£257,314	£727,774	£293,305	£2,922,419	£5,043,748	£10,295,290
Victoria	2,954,617	4,355	2,356	10,561	79,731	95,469	3,147,069
Queensland	1,978,938	112,540	1,028,179	496,766	222,135	293,606	4,132,163
South Australia..	36,602	Not Given	714,525	44,176		118,560	913,863
West'n Australia	7,210,749	25,382	180,387	158,648	55,158	3,742	7,634,066
Tasmania	277,607	Not Given	869,666	501,681	50,067	578,148	2,277,159
Commonwealth .	13,509,243	Not Given	3,522,887	1,506,107	3,329,500	6,133,272	28,399,600

The total mineral production of Australia down to the end of 1907 amounted to £692,321,274, of which gold represented £488,422,978; silver, over £4,363,773; copper, £49,295,016; tin, £26,011,526; coal, £59,717,864; all other, £64,510,117. For the year ending Dec. 31, 1908, the Australian output of gold was estimated at \$3,085,610 in value, as compared with \$3,182,381 in 1907. The production in every State shows a decline, except South Australia, where it increased in value by \$14,500.

In the following statement some additional information is given concerning the mineral production of the separate States.

In New South Wales the value of silver-lead in 1907 was £3,659,632; coal production, 8,657,924 tons; lead, 19,768 tons, valued at £374,182; zinc, 237,219 tons, valued at £536,620; coke, 254,609 tons, £159,316; cement, £144,548. In Queensland, the production of coal in 1907 was 683,272 tons; lead, 5,157 tons, £75,330; wolfram, 615 tons, £89,767; gems, £40,500. The pearl fisheries of Thursday Island yield the finest pearls in the world, one of which, valued at \$15,000, was in 1908 forwarded to London. The export of pearl shell from Thursday Island in 1906 amounted to 994,448 lbs., valued at

£47,423; bêche-de-mer, 293,888 lbs., valued at £13,938; tortoise shell, 3,659 lbs., valued at £2,007. In West Australia, the production of coal in 1907 was 142,373 tons.

AGRICULTURE. The following table shows, by States, the total area (acres) under cultivation, the area under crops, and that under artificially sown pasture, in 1907:

	Under Cultivation	Under Crops	Under Artificial Pasture
New S. Wales	3,916,956	2,572,873	736,080
Victoria	4,126,823	3,232,523	1,095,471
Queensland	642,979	532,624	76,943
S. Australia	3,246,824	2,150,291*	23,679*
W. Australia	579,425	460,825	6,787
Tasmania	290,576	257,028	465,673
Commonwealth ...	12,772,971	9,206,164	2,404,633

* 1906.

The areas under principal crops in 1907-8 are shown in the following, in acres:

	Wheat	Barley	Maize	Potatoes	Hay
N. S. Wales	1,390,171	11,890	160,980	31,917	541,761
Victoria	1,847,121	63,074	10,844	54,149	682,194
Queensland	82,461	6,943	127,119	7,889	54,087
S. Australia	1,753,755	28,122*	—	9,894*	271,067
W. Australia	280,549	6,007	87	1,836	130,508
Tasmania	30,794	5,852	—	38,640	73,859
Commonwealth	5,384,851	121,888	299,030	144,325	1,753,428

* 1906-7.

The yield of the principal crops in 1907-8 was as follows:

	Wheat	Barley	Maize	Potatoes	Hay
	<i>bushels</i>	<i>bushels</i>	<i>bushels</i>	<i>tons</i>	<i>tons</i>
N. S. Wales	9,155,884	75,268	4,528,540	55,882	367,800
Victoria	12,100,780	1,058,295	508,761	135,110	682,370
Queensland	693,527	64,881	3,083,789	13,177	77,601*
S. Australia	19,135,567	491,246*	—	22,777*	315,857
W. Australia	2,933,350	75,965	1,090	5,659	136,625
Tasmania	644,285	149,186	—	146,483	98,406
Commonwealth	44,663,333	1,915,841	8,132,170	377,583	1,678,659

* 1906-7.

The area under sugar-cane in New South Wales was 17,953 acres; that crushed, 9,916 acres; yield of cane, 277,300 tons. The acreage under sugar in New South Wales has been decreasing, due to the superior attractiveness of dairy farming. The output of sugar in New South Wales in 1907-8 was 29,000 tons; in 1908-9, 27,000.

The cultivation of cotton in Queensland, abandoned in 1899-1900, was resumed in 1902, when 8 acres were planted. In 1907, there were 300 acres under cotton, yielding 109,294 lbs. of unginned cotton. Over one-half the area—152 acres—was cultivated at Cairns. The area under sugar-cane in 1907 was 126,810 acres; that crushed, 94,384 acres; yield of cane, 1,665,028 tons. The acreage under cane declined 6,474, and that crushed, 3,810, as compared with 1906, while the tonnage of cane was 63,752 tons less. Nevertheless, the output of sugar was 188,307 tons—an increase of 3,930 tons over 1906. For 1908-9 the sugar output was estimated at 160,000 tons. The area planted in tobacco in 1907 was 459 acres, against 666 acres in 1906, and the crop was 2,442 cwts., against 6,454 cwts. in 1906. The production of tobacco is practically confined to the Southern Downs, in the districts of Inglewood and Texas. The coffee production in 1907 was 112,453 lbs.—an average of 433 lbs. per acre.

In South Australia wine culture is becoming one of the most important industries. In 1898 there were 18,761 acres under vines, with 8,021,070 vines bearing and 1,803,367 non-bearing. In 1907 the area increased to 22,586 acres, with 10,599,712 vines bearing, and 1,523,999 non-bearing. The wine production in 1907 was 2,495,434 gallons, and the wine in stock was 5,392,245 gallons. About one-fourth of the annual production is exported. The manufacture of spirits in 1906 was 335,412 gallons. The export of apples in 1908 was the highest on record—147,251 cases, of which 110,294 went to Great Britain, and 19,058 to the European continent. A fibrous growth known as *Posidonia Australis*, covers an area many miles in extent in Spencer Gulf, South Australia, and often reaches within three or four feet of the surface of the water. Large samples have been

raised and cleaned, and it is believed that the discovery will be of great commercial value. The fibre is similar to jute tow, is strong, not inflammable, and absorbs dye very freely. A British-American company has secured an area of 5 square miles, and an Adelaide company has obtained the rights to 16 square miles. In the latter part of 1908 there was formed in Melbourne a syndicate, which has secured 15 square miles, situated about 25 miles from Port Pirie. The concession contains 12 feet of fibre under 4 feet of water. The syndicate proposed to obtain a special dredge, on which there will be complete accommodation for washing, drying, and packing. The estimated area under wheat in 1908-9 was 1,727,692 acres, and the estimated yield, 19,979,746 bushels. The estimated area under hay in 1908-9 was 334,408 acres, and the estimated yield, 504,311 tons.

The number of live stock in 1907 is shown in the following table:

	Horses	Cattle	Sheep	Pigs
N. S. Wales.....	578,326	2,746,393	44,531,839	216,145
Victoria	424,648	1,842,807	14,146,734	211,002
Queensland	488,486	3,892,232	16,738,047	133,246
S. Australia ...	224,447*	680,095*	6,916,000	112,277*
W. Australia ..	113,117	759,046	3,694,852	53,115
Tasmania	40,392	215,046	1,744,800	46,704
Commonwealth	1,869,416	10,136,096	87,772,632	772,489

* 1906.

The Australian wool year ends in June. The wool production of 1906-7 was 561,927,000 lbs.; of 1907-8, 539,762,000 lbs. The sales of wool in 1907-8 amounted to 1,218,772 bales (of about 334 lbs. each), or about 74.9 of the total production. Owing to the fall in prices in October, 1907, sales were restricted, and in the middle of 1908 it was reported that about 36,000 bales were being carried over. The progress of closer settlement and diversified farming, i. e., agricultural and pastoral combined, is illustrated in the following table, published by the New South Wales government statistician, concerning the classification of sheep flocks in that State at the close of 1897 and 1907. The in-

crease of small flocks and the decrease of large flocks are striking.

Size of flocks	1897		1907	
	Flocks	Sheep	Flocks	Sheep
500 and under	6,926	1,249,492	12,321	2,018,284
501 to 1,000	2,450	1,920,485	3,602	2,694,450
1,001 to 2,000	1,767	2,710,546	8,148	4,587,219
2,001 to 5,000	1,383	4,511,676	2,354	7,245,911
5,001 to 10,000	651	4,625,398	835	5,837,076
10,001 to 20,000 . . .	436	6,230,663	520	7,388,940
20,001 to 50,000 . . .	406	12,468,278	320	9,392,069
50,001 to 100,000 . .	104	6,972,298	66	4,359,321
100,001 and over . . .	21	3,264,061	7	938,569
Total	14,144	43,952,897	23,173	44,461,839

The following table shows the sheep flocks in New South Wales classified according to the number contained therein and the area of holdings on which they are pastured:

Area of holdings (acres)	Flocks	Sheep
1 and under 51	1,268	32,529
51 and under 101	811	45,001
101 and under 501	5,611	1,059,165
501 and under 1,001	4,399	2,023,708
1,001 and under 5,001	7,739	10,515,524
5,001 and under 10,001	1,391	5,037,113
10,001 and under 20,001	762	5,318,247
20,001 and under 50,001	579	7,336,742
50,001 and under 100,001	227	4,751,639
100,001 and upward	249	8,205,802
Ill-defined areas	139	136,369
Total	23,173	44,461,839

The Commonwealth Bounties Act of 1907 provided for the appropriation of £339,000 for the payment of bounties during a period of 15

years, commencing on July 1, 1907, on certain goods produced in Australia, including ginned cotton, flax, hemp, jute, sisal hemp, cottonseed and linseed supplied to oil factories for the manufacture of oil, uncleaned rice, rubber, coffee, high grade cigar leaf tobacco, dried dates, dried or candied fruit for export, combed wool for export, and preserved fish. The bounty on coffee is 1d. per lb., and the industry is further encouraged by an import duty of 3d. per lb. The bounty on cigar leaf is 2d. per lb.

MANUFACTURES. The manufactures are mainly confined to the treatment of perishable materials, such as meat preserving, butter and cheese making, wool cleaning, sugar manufacturing, wine making, distilleries and breweries, flour milling, the making of biscuits, jams, pickles, condiments, etc. Other industries are: Clothing, boots and shoes, bricks, pottery, etc. Industries of a more complex character are represented by the iron works at Lithgow, N. S. W., machine shops and metal works. In 1908, the Commonwealth government secured a site at Lithgow for the erection of the first Australian small arms factory. At first only rifles were to be manufactured, but later the manufacture of shells was to be undertaken. It was the object of the government to be in a position to manufacture the bulk of the war materials required for Australian defense. The following table presents some details regarding these Australian industries in 1906 and 1907, by States:

	No. of Factories	Workers	Value of Plant and Machinery	Value of Land and Premises	Value of Output
N. S. Wales	4,387	67,194	—	—	—
Victoria	4,530	90,903	£6,771,458	£8,376,642	£30,399,945
Queensland	1,725	28,856	4,036,379	2,371,423	11,106,979
S. Australia *	1,018	20,806	—	—	—
W. Australia *	802	13,739	1,913,436	1,893,019	—
Tasmania *	373	8,441	841,883	980,837	—

* 1906.

FOREIGN COMMERCE. In 1907, the total imports amounted to £51,809,033, and the total exports to £72,824,247, against £44,729,506 and £69,737,763 respectively in 1906. The 1907 imports included £1,834,200 specie and bullion, consisting mainly of gold imported from New Zealand for coining and trans-shipment. The amount of specie and bullion included in the 1907 exports was £72,824,247. The principal articles of import were: Apparel and textiles, £12,582,557; iron and steel plate, bars, etc., £2,443,563; metal manufactures, £3,929,828; agricultural implements, £409,502; other machinery, £2,754,596; jute goods, £1,373,667; timber, £1,606,290; tea, £1,153,322. The principal exports of merchandise were: Butter, £2,890,531; wheat, £4,802,723; flour, £1,296,348; wool, £28,891,830; copper, £3,457,226; frozen

mutton and lamb, £1,377,502; hides and skins, £2,823,376; tallow, £1,017,198; tin, £1,122,474. The distribution of imports according to countries of origin was as follows: Great Britain, £26,446,728; British possessions, £5,076,081; foreign countries, £18,974,833, of which £1,742,623 came from France, £4,623,136 from Germany, £6,765,182 from the United States, £632,486 from Belgium, £681,905 from Switzerland, and £575,045 from Japan. Provisional United States returns for 1908 give American imports from Australia at \$11,502,739, and American exports to Australia, \$26,471,918.

COMMUNICATIONS. The total railway mileage on June 30, 1907, was 15,250 miles. The details respecting the operation of State railways in 1907 are shown in the following table:

	Miles Open	Receipts	Expenditure	Net Earnings	Interest on Loans	Surplus or Deficiency—
N. S. Wales	3,473	£4,944,134	£2,714,839	£2,229,295	£1,605,377	£623,918
Victoria	3,400	4,022,231	2,370,695	1,651,536	1,487,984	163,552
Queensland	3,197	1,949,240	956,129	993,111	917,063	76,048
S. Australia*	1,977	1,569,386	881,285	708,101	555,871	152,230
W. Australia	1,764	1,537,333	1,135,907	401,426	358,734	42,692
Tasmania *	462	258,223	185,500	72,723	144,839	—72,116
Commonwealth	14,273	14,300,547	8,244,355	6,056,192	5,069,868	986,324

*1906

In 1908 the Federal Parliament voted £20,000 towards a survey of the proposed railway from

Kalgoorlie, W. A., to Port Augusta, S. A., and survey parties were despatched from South and

Western Australia. The survey is expected to occupy one year. This is the first step towards linking Western Australia with the railway systems of the eastern States. The total length of telegraph lines in 1906 was 47,525 miles. The shipping entered and cleared in 1907 was 8,822,866 tons. The merchant marine at the end of 1906 consisted of 1,082 steamers, of 238,742 tons, and 1,644 sailing vessels, of 128,288 tons.

FINANCE. In the fiscal year 1907-8 the total Commonwealth revenue and expenditure balanced at £15,018,489. The revenue from customs and excise was £11,645,409; from post office, telegraph and telephone, £3,297,100; miscellaneous, £73,289; balance from previous year, £2,691. The expenditure was distributed as follows: Trade and customs, £277,027; posts and telegraphs, £2,885,540; defence, £865,433; public works, £876,366; miscellaneous, £15,689; "new" expenditure, £1,238,838; surplus distributed among the States, £8,859,596. For 1908-9 the revenue was estimated at £14,577,000; expenditure, £6,513,000; and surplus to be returned to the States, £8,064,000. The revenue (including amounts returned to the various States for the terms and dates indicated were as follows:

	Revenue	Expenditure	Debt, June 30
N. S. Wales, 1907-8....	£13,960,763	£12,158,456	£87,635,826
Victoria, 1906-7	8,345,534	7,679,143	53,104,989
Queensland, 1906-7	4,307,912	3,911,797	41,764,467
S. Australia, 1906-7	3,252,705	3,396,499	30,526,718
W. Australia, 1907-8 ..	3,376,640	3,379,005	20,493,618
Tasmania, 1907-8	1,004,309	928,972	10,056,122

ARMY AND NAVY. The military forces of the Commonwealth, administered by the States, consisted on June 30, 1908, of 1,379 permanent troops, 16,154 militia, 5,098 volunteers, 889 reserves, 50,375 members of rifle clubs, and 29,191 cadets, giving a total of 103,086 officers and men. In 1908, the Commonwealth Government was contemplating a comprehensive scheme of military organization, the leading features of which were as follows: Every boy from 12 to 18 years of age must serve in a cadet corps; from 18 to 21 he must be a member of the National Guard and undergo three annual trainings, aggregating 48 days; and between 21 and 26 he will be incorporated in the first line of the active army. The whole organization is to be on a democratic basis, promotion being from the ranks. It has been computed that under this system 27,000 youths will enter the ranks every year; 83,000 will be undergoing military training in each year; and in eight years there will be 214,000 trained men. (See below.) The naval force of the States on June 30, 1908, contained 1,796 men. The British fleet stationed in Australasian waters, of which Sydney is the headquarters and to the maintenance of which Australia contributes £200,000 annually, consisted in 1908 of 20 cruisers and minor vessels, aggregating 47,000 tons. For the proposed small arms factory at Lithgow, see above under *Manufactures*.

GOVERNMENT. The Governor-General in 1908 was the Earl of Dudley. The Cabinet of Nov. 12, 1908, was as follows: Prime Minister and Treasurer, Andrew Fisher; Trade and Cus-

toms, Frank Gwynne Tudor; Attorney-General, Wm. Morris Hughes; External Affairs, Egerton Lee Batchelor; Defense, George Foster Pearce; Home Affairs, Hugh Mahon; Postmaster-General, Josiah Thomas; without portfolio, J. Hutchinson. For the colonial possession of Australia see PAPUA.

HISTORY.

POLITICAL ISSUES. The Deakin Cabinet continued in office during the greater part of 1908. As in the preceding Parliaments, the Labor party held the balance of power. The Federal elections of 1906 had left the "triangular anarchy," as some critics called the three-party system, substantially unchanged. The programme of the Labor party as put forth in 1905 embodied the principles of a "White Australia," Federal unity, collective ownership of monopolies, and the extension of State and municipal functions in economic and industrial affairs. The leading issue in the campaign of 1906, supported alike by the followers of Mr. Deakin and by the Labor party, was the principle of the "new protection," that is, the imposition of protective duties only for the benefit of such industries as conformed to certain requirements in the matter of wages and manufacturing processes. If the domestic producer did not conform to these requirements, a countervailing excise duty was to be levied on the protected article. The elections of 1906 were regarded as an endorsement of this principle; and in October, 1907, legislative proposals embodying it were outlined by Sir William Lyne. These were contained in the Federal Excise Tariff Act, subsequently passed, whose provisions are described below. The constitutionality of this measure was a leading topic of discussion during 1908. Other important issues before the country were the policy of military and naval defense; the question of Federal assumption of State debts; the question of State and Federal coöperation in the immigration policy, and the old age pension scheme.

FEDERAL AND STATE GOVERNMENTS. There was a conference of State Premiers in May to discuss the assumption of State debts. The proposal of the Commonwealth was unanimously rejected, unless it observed the following conditions: (1) Payment to each State of a fixed annual sum in addition to its share of any increase in revenue from customs and excise; (2) The States to be the sole judges in raising loans without any interference by the Council of Finance; (3) In the event of assumption, the total indebtedness of each State to be reduced by the value of the properties transferred from the States to the Commonwealth. The arguments which Mr. Deakin had urged on behalf of Federal assumption were, that in the end it would reduce the cost to the States, since even the wealthiest of them could not expect to place a loan on as good terms as the six States combined. Moreover, the rate would be fixed and uniform, a single Australian stock taking the place of the separate State stocks and resting on the credit of the entire Commonwealth. This stock would not vary in price in the world's markets to the extent to which the separate stocks would vary. The appeal of the central government to the States to co-operate with it in a strong immigration policy met with little better success. Early in the year Mr. Deakin had written to the State governments, asking them what inducements they

THE EARL OF DUDLEY

Governor-General of Australia

intended to offer to encourage the immigration of people of their common race. Apparently the States preferred to follow their separate courses. To Mr. Deakin's questions as to the number of immigrants each State would take and as to the means that the Federal government should adopt in order to procure them, the only answer was, that the requirements of the States differed and that each State could deal with the matter separately to better advantage. Later, however, Victoria adopted a different attitude from the other States and decided to give the government the desired information.

THE DEFENSE SCHEME. The subject of Australian defense, which was much discussed during the year 1907, continued to be a topic of importance in 1908. On December 13, 1907, the Premier had given an outline of the government's defense policy. He proposed that the officers and men for a small Commonwealth flotilla should be engaged in Australia under Royal Navy conditions or obtained from the Royal Navy, preference being given to Australians; and that the vessels should be paid for and controlled by Australia. In case of war it was to be expected that the fleet would be placed under the command of the Admiral of the station. The government planned to buy three steamers and two coastal torpedo boat destroyers of the latest type each year for three years. To the home government it was proposed that one-half of Australia's annual contribution of £200,000 to the Imperial Navy be spent on providing for 1000 native seamen and the remaining half on the building of the flotilla. As to military defense, the plan provided for compulsory military training of young men of 18 years of age and over to the extent of 16 days' camp training each year for three years. It looked to the establishment, within a period of eight years, of a national corps of over 200,000 men. Early in 1908 the plan of the government was more definitely formulated and modified in details. The Premier announced in March that the government was prepared to spend £430,000 a year on harbor and coast defense, and \$230,000 upon the construction of a local flotilla. He estimated the total military and naval expenditures for three years at £1,800,000 annually, and he declared that within eight years there would be an army of 200,000 and a flotilla of 15 harbor and coast defense vessels. The new defense bill was introduced in the Federal House of Commons on Sept. 29. It established a national corps of compulsorily trained men and provided for the retaining of so much of the existing militia as the Ministry desired. The principle on which it was based was that of universal military service. All able-bodied males between the ages of 12 and 18 were to receive a cadet training, and from 18 to 21 were to serve in the National Guard. The training proposed for recruits between the ages of 18 and 21 was to last for 18 days during the first and second years, and 12 days during the third year. The new measure took the form of amendments to the Defense Acts of 1903-4, and the portions of these acts which were not amended remained in force, including liability to serve between the ages of 18 and 60 years in time of war. It was denounced by its enemies as a conscription bill. To this it was answered that while conscription took a

man from his home for years, this merely gave him a few weeks' healthful work and training in the open air. It was further declared that the voluntary system was generally acknowledged by the military officers to have been a failure; that while there were 800,000 adults in Australia within the fighting ages, less than 20,000 had enrolled in the defense force. The government estimated that by this measure 82,000 men could be had for only £100,000 more than they were now paying. Meanwhile Parliament had already passed, before its adjournment on June 4, a harbor and coast defense bill. In reply to the questions raised in connection with the proposed flotilla, the British Admiralty said on August 20, that while they believed defense against oversea attack could best be made by distributing the Imperial naval forces, they recognized the importance of the local flotilla and would coöperate in its formation. A *Blue Book of the British Government* containing the correspondence on the subject was published on Oct. 15, 1908.

OLD AGE PENSIONS. The Old Age Pension Law, passed on June 4, by the Commonwealth government just before its summer adjournment, provided for pensions of \$2.50 a week to all indigent persons 65 years of age or more, who had resided in the Commonwealth for not less than 20 years; also for persons over 16 years of age, permanently disabled. It was estimated that the cost of the measure would be \$9,000,000 annually. (See OLD AGE PENSIONS.)

THE "NEW PROTECTION." The Federal Excise Tariff Act, above mentioned, laid an excise duty at the rate of half the import duty on all goods of the same class as those protected, but exempted such goods as were manufactured under certain prescribed conditions, especially as to the remuneration of labor. It was required that the remuneration of labor should be "fair and reasonable." To determine what was a "fair and reasonable" rate, a special Board of Excise was to be established to inquire into the conditions of the manufacture and decide whether the remuneration of labor was up to the required standard. If it attained that standard, the Board would then apply to the goods the Commonwealth trade-mark. Wide powers were given to the Board for the inspection of factories, examination of books, etc. If the Board found unduly high prices or combinations to raise prices in industries protected by the tariff, it could recommend to Parliament the abolition, or lowering, of the duty. The constitutionality of this measure was much discussed during the year, and test cases were brought before the Federal High Court, which decided in June that an attempt to regulate wages by excise duties was *ultra vires*. Thereupon the Premier declared that the government must adopt some means of overcoming this obstacle. On the opening of the Federal Parliament on Sept. 16, the new Governor-General, the Earl of Dudley, also emphasized this necessity, declaring that the constitution should be amended so as to provide for the "new protection." In October, a measure was laid on the table, for the amendment of the constitution for this purpose. It empowered Parliament to legislate concerning the employment and remuneration of labor in any protected industry, and bestowed on the Inter-State Commission power to determine

which industries should be protected and to administer the law.

CHANGES IN THE GOVERNMENT. In March, 1908, the Earl of Dudley was appointed Governor-General to succeed Lord Northcote. On Sept. 9, the new Governor-General landed and took his oath of office at Sydney, and on Sept. 16, opened the Commonwealth Parliament. The Ministry experienced difficulties with the Labor party during the year. In April, owing to the disaffection of several members, who acted with the Opposition, the Premier threatened to resign, but upon the assurance that better discipline would be maintained, decided to remain at the head of the Government. The Labor party, however, was dissatisfied with the measures of the government in regard to the "new protection," ostensibly on the ground that they did not go far enough. After Mr. Deakin offered the amendment to the constitution above mentioned, Mr. Fisher, the leader of the Labor party, announced that they would withdraw their support. On Nov. 10 the government was defeated on division by 49 against 13, and on the following day Mr. Fisher was sent for by the Governor-General to form a new Ministry. In the new Cabinet, Mr. Fisher became Prime Minister and Treasurer. The new Ministry was made up entirely of the Moderate element in the Labor party. On Nov. 21 Mr. Reid resigned as leader of the Opposition.

OTHER EVENTS OF THE YEAR. The people joined the government in giving a most cordial welcome to the United States fleet, which visited Sydney on Aug. 20, and afterwards visited Melbourne and Albany. (See UNITED STATES, paragraph Navy.) In the autumn session of Parliament the choice of the Yass-Canberra district as the site of the new capital of the Commonwealth was approved by both Houses. Lord Rosebery's committee having proposed in the course of its report on the reform of the House of Lords (early in December), that nominees of the self-governing colonies of the Empire should be present at the deliberations of the Lords, Mr. Fisher declared himself in favor of the plan, provided their decisions were not binding. On Aug. 4 an important judicial decision was rendered, pronouncing it unconstitutional to register a union label as a trade-mark.

AUSTRIA-HUNGARY. The Austro-Hungarian Monarchy consists of the Austrian Empire and the Hungarian Kingdom, besides the Territories of Bosnia and Herzegovina. An account of the annexation of these territories as integral parts of the dual monarchy will be found under the section *History*, in the article BALKAN QUESTION, and BOSNIA, and HERZEGOVINA. The area and population (1900) of the constituent parts of the monarchy are as follows: Austria, 115,905 square miles and 26,150,708 inhabitants; Hungary, 125,608 square miles and 19,254,559 inhabitants; total, 241,513 square miles and 45,405,267 inhabitants. Included in the figures for Hungary is the province of Croatia and Slavonia, 16,410 square miles and 2,416,304 inhabitants. According to language the population was divided in 1900 as follows:

	Austria	Hungary	Monarchy
German	9,170,939	2,135,181	11,306,120
Hungarian	9,516	8,742,301	8,751,817
Bohemian, Moravian and Slovak	5,955,397	2,019,641	7,975,038
Polish	4,259,152		4,259,152
Ruthenian	3,375,576	429,447	3,805,023
Croatian and Servian	711,380	2,730,749	3,442,129
Slovenian	1,192,780	98,941	1,291,721
Rumanian	230,963	2,799,479	3,030,442
Italian and Ladin	727,102	27,482	754,584
Others and foreigners	517,903	271,338	789,241
Total	26,150,708	19,254,559	45,405,267

At the beginning of 1907 the population of Austria was estimated at 27,725,749. This is probably in excess of the actual population, as the increasing emigration, particularly from Galicia, Bukovina, Carniola, and Dalmatia, could not be taken into the calculation.

In 1906, the number of marriages in Austria was 215,956; births, 973,660; deaths, 633,140; and in Hungary, 170,826 marriages, 748,060 births, and 504,790 deaths. Insufficient data show the emigration of Austrians in 1906 to have been 136,354; of Hungarians, 178,170. The population of the principal cities of Austria in 1900 was as follows: Vienna, the capital, 1,711,556 (estimated Dec. 31, 1907: 1,999,912); Prague, 201,589 (June 10, 1907, including suburbs and garrison of 10,583: 470,906); Lemberg, 159,877; Gratz, 138,080; Trieste, 134,143; Brünn, 109,346; Cracow, 91,323; and of Hungary, estimated at the end of 1907: Budapest, the capital, 891,066; Szegedin, 114,423; Maria-Theresiople (Szabadka), 89,888; Debreczen, 86,674; Presburg (Pozsony), 73,896; Agram (Zagrab), 74,900; Fiume, 44,620.

EDUCATION. In Austria in 1905 there were 21,502 elementary schools, with 86,969 teachers and 4,001,645 pupils; in 1906, 233 gymnasias with 84,450 pupils, and 128 *realschulen* with 44,769 pupils. The eight universities had about 21,000 students in 1907. The eight technical universities had in 1908 nearly 10,500 students. In 1906 there were 190 agricultural and forestry schools with 8,000 pupils. The number of commercial schools in 1905 was 272, with 29,300 pupils; of trade schools, 1,274, with 127,400 pupils. In Hungary there were in 1906 19,064 primary schools, with 39,957 teachers and 2,717,975 pupils; 179 gymnasias with 3,530 teachers and 57,400 pupils; 41 *realschulen*, with 902 teachers and 12,173 pupils; and three universities, with 9,300 students. The technical university in Budapest had about 1,300 students. There are about 900 special agricultural, commercial, technical and industrial schools, with 150,000 pupils. On Dec. 31, 1906, there were published in Austria 3,825 newspapers and periodicals, of which 2,291 were in German, 109 in Italian, 840 in Czech, 297 in Polish, 48 in Ruthenian, 77 in Slovenian, 35 in Croatian, 8 in Rumanian, 57 in other languages, and 51 in several languages.

AGRICULTURE. The total cultivated land of Austria in 1907 covered 10,653,703 hectares (1 hectare = 2.47 acres). The area and production of the principal crops of Austria in 1907 are shown in the following table (1 quintal = 220½

COPYRIGHT, 1907, BY DODD, MEAD & CO.

lbs., 1 hectolitre = 2.84 U. S. bushels, 1 liquid hectolitre = 26.42 U. S. gallons):

	Hec- tares	Production
Wheat.....	1,179,455	14,252,632 quintals
Rye.....	1,963,577	21,959,777 quintals
Barley.....	1,166,526	17,108,296 quintals
Oats.....	1,935,710	24,763,320 quintals
Maize.....	348,344	4,216,259 quintals
Buckwheat..	181,319	2,359,524 hectolitres
Pulse.....	212,969	4,183,180 hectolitres
Wine.....	237,807	4,250,342 hectolitres
Flax.....	62,681	{ 814,680 quintals of seed and 463,428 quintals of fibre
Hemp.....	29,377	{ 138,503 quintals of seed and 213,229 quintals of fibre
Tobacco ..	5,114	68,622 quintals
Hops.....	23,866	135,966 quintals
Potatoes...	1,258,545	146,634,423 quintals
Sugar beet	232,574	63,938,958 quintals
Meadows...	2,988,781	92,922,344 quintals of hay

The output of grapes was 41,753 quintals; figs, 74,410 quintals; chestnuts, 39,411 quintals; olive oil, 9,294 quintals. The production of silk cocoons in 1906 was 2,083,570 kilograms.

The acreage and production of cereal crops and potatoes in Hungary, exclusive of Croatia and Slavonia, in 1907, and the estimates for the same in 1908, were as follows:

	Acres, 1907	Bushels,* 1907	Acres, 1908	Bushels,* 1908
Wheat ...	8,069,300	120,506,000	8,547,000	146,498,000
Rye, incl.				
Maslin ..	2,632,500	42,097,000	2,743,000	48,871,000
Barley ...	2,725,200	53,078,000	2,700,000	56,564,000
Oats	2,653,100	79,484,000	2,649,000	72,291,000
Maize ...	6,081,500	156,616,000	5,936,000	152,159,000
Potatoes	1,407,600	178,156,000	1,442,000	134,940,000

* Wheat and potatoes, 60 lbs.; rye and maize, 56 lbs.; barley, 48 lbs.; oats, 32 lbs.

The production of wheat in Croatia and Slavonia in 1907 was 10,200,000 bushels; rye, 3,000,000; barley, 2,100,000; oats, 4,200,000; maize, 25,600,000. The production of silk cocoons in Hungary in 1907 amounted to 1,407,155 kilos, valued at 2,874,032 kronen (1 krone = 20.3 cents), against 1,776,682 kilos in 1906; an inspectorate of the silkworm industry was established, and some 85,000,000 mulberry saplings were distributed. The production of sugar beets in Austria-Hungary in 1907-8 was 8,603,500 tons, and was estimated at 7,913,300 tons for 1908-9.

MINING AND METALS. The leading mineral products of Austria in 1907 were valued as follows, in kronen (1 krone = 20.3 cents):

	Ores	Metals
Gold	615,926	455,522
Silver	2,798,149	4,131,009
Quicksilver	2,198,042	2,487,322
Copper	524,712	1,318,880
Iron	21,911,283	109,695,842
Lead	5,424,601	6,993,331
Zinc	2,735,109	6,178,142

The production of iron ores in 1907 was 2,540,118 metric tons; pig iron, 1,363,524 metric tons. The production of coal was 13,850,420 metric tons, valued at 125,529,105 kronen; brown coal, 26,262,110 tons, valued at 129,492,964 kronen; briquettes (coal and brown coal),

3,702,391 kronen; coke, 1,855,375 tons, valued at 35,064,635 kronen. The total value of the mining production in Austria in 1907 was 294,238,741 kronen, showing an increase of 33,864,646 kronen over 1906; of the furnace production, 132,807,655 kronen, an increase of 14,855,408; of salt works, 48,185,552 kronen, an increase of 235,551. The total net value (i. e., after deducting value of ores used in furnaces) of the mineral, furnace, and salt production in 1907 was 420,905,064 kronen, an increase of 40,344,067 kronen over 1906. Bohemia contributed in 1907 48 per cent. of the total value of the mining and furnace production, and Styria, 16.14 per cent. The total number of workers in the mining, metal and salt works in 1907 was 159,552, of whom 56,326 were employed in brown coal mines and 69,995 in coal mines.

The value of the principal mineral and metal products of Hungary in 1906 was as follows: Gold, 12,255,233 kronen; silver, 1,426,335; lead, 866,803; coal (1,026,056 metric tons), 10,796,536; brown coal (6,307,185 tons), 45,732,508; briquettes, 2,290,558; coke (79,923 tons), 2,126,297; pig iron (419,691 tons), 33,843,039; antimony, 1,922,454. The total value of the products of mines and furnaces in Hungary in 1906 was 118,411,187 kronen, against 106,732,027 in 1905. The number of employees in mines and furnaces in 1906 was 72,290 (including 1673 women and 4934 children), of whom 9473 were engaged in coal mining, 31,274 in brown coal mining, 10,300 in iron mining, 16,181 in mining for other minerals, 4376 in iron furnaces, and 1066 in other metal furnaces. The number of serious accidents was 457, of which 109 were fatal.

MANUFACTURES. In the year ending Aug. 31, 1908, there were in Austria 4,026,460 cotton spinning spindles. The mill consumption of cotton during the year was 739,941 bales (467,230 American, 237,702 East Indian, 27,922 Egyptian). The development of the cotton industry since 1900 has been remarkable. Whereas formerly Austria was not able to supply its own demand for cotton goods, its exports in 1907 amounted to \$20,689,000, besides supplying the needs of Hungary. About one-half the cotton goods exports goes to Turkey and the Balkan States. The tobacco industry is a government monopoly, the cultivation, manufacture, and sale of tobacco being controlled by government officials. There are two distinct offices for the management of the business, one for Austria and one for Hungary. The imports of leaf tobacco greatly exceed the exports, having been 26,372 and 7527 tons respectively in 1906, but the exports of the manufactures of tobacco exceed the imports of them. Thus the imports of cigars in 1906 amounted to 84,940 pounds, and the exports, 215,520; the imports of cigarettes, 155,000 pounds, and the exports, 551,760 pounds. The production of raw sugar in Austria-Hungary in 1907-8 was 1,393,900 tons; in 1908-9, 1,355,200 tons. Austria is by far the more industrial half of the dual monarchy, but beginning with 1881 there has been a series of laws adopted in Hungary for the encouragement of industry and granting subventions, loans, and other favors to new industries. The latest of these laws came into force in January, 1907, and the amount granted in the first nine months of 1907 for the development of home industries was 11,907,990 kronen, of which 9,921,869 was given

to manufacturers. At the beginning of 1907 there were in Hungary 630 factories employing 71,400 workers. The centre of the cotton industry is at Rozsahegy (Rosenberg), in the north of Hungary, containing about half the cotton spindles. In January, 1908, there were in Hungary 2 spinning mills, with 65,120 spindles; 3 spinning and weaving mills, with 85,040 spindles and 2126 looms; 14 weaving mills, with 2953 looms; 3 thread mills, with 20,000 spindles; and 1 waste spinning mill, with 1300 spindles; giving a total for the cotton industry of 23 mills, 171,460 spindles, and 5079 looms. The silk cocoons produced in Hungary are worked up into silk in the country itself; in 1907 the silk manufactured amounted to 125,000 kilos, valued at 6,800,000 kronen.

Towards the end of 1908 the Austrian Cotton Spinners' Association decided to reduce the yarn production by about 15,000,000 to 16,000,000 pounds during the first six months of 1909. This measure was due to the large stocks of yarn on hand, low prices, and unfavorable outlook. The loss of trade in Turkey was severely felt. This action of the spinners, it was expected, would be followed by a corresponding decision on the part of the weavers.

COMMERCE. The commercial union of the two States requires to be renewed every ten years. Begun under the present constitutional arrangement in 1867, it was renewed in 1878 and 1887, maintained on its former basis, notwithstanding disagreement in 1907, (see below, *Finance*), and renewed in 1907. Under this agreement Austria-Hungary forms one customs territory, with common coinage, weights, and measures, a joint bank of issue, common consular representation, and identical excise taxes. The imports for consumption and exports of domestic produce in 1907 amounted to 2,501,974,000 and 2,457,286,000 kronen respectively, against 2,341,205,000 and 2,380,087,000 respectively in 1906 (1 krone = 20.3 cents). The imports and exports of coin and bullion in 1907 amounted to 43,838,544 and 79,455,917 kronen respectively. The principal imports in 1907 were, in kronen: Colonial produce, 66,699,095; southern fruits, 40,125,778; tobacco, 44,100,902; cereals, flour, flour products, and pulse, 37,143,705; vegetables, fruits, and plants, 104,325,143; living animals, 31,775,383; animal products, 166,855,343; greases and oils, 55,303,283; wood, coal, and turf, 210,926,858; minerals, 48,160,085; cotton, yarn, and manufactures thereof, 375,995,381; other vegetable textile materials, yarns, and manufactures thereof, 84,249,428; wool, yarn, and manufactures thereof, 237,810,530; silk and silk goods, 112,907,830; paper and paper manufactures, 29,858,171; india rubber, gutta percha, and their manufactures, 34,649,655; leather and its manufactures, 61,130,475; iron, steel, and manufactures thereof, 49,245,702; other common metals and their manufactures, 129,015,831; machinery and electrical apparatus, 111,167,176; instruments, watches, and small ware, 45,065,123; chemical substances, drugs, and perfumery, 69,823,353; literary and artistic articles, 52,276,020. The principal exports in 1907 were, in kronen: Sugar, 198,669,989; cereals, flour, flour products, and pulse, 157,239,092; vegetables, fruits, and plants, 92,448,827; living animals, 105,419,633; animal products, 213,452,727; beverages, 39,180,432; wood, coal, and turf, 396,705,039; minerals, 48,087,665; cotton, yarn, and manufactures thereof, 90,748,247; other

vegetable textile materials, yarns, and manufactures thereof, 66,779,740; wool, yarn, and manufactures thereof, 113,260,980; silk and silk goods, 46,437,998; clothing, 93,975,686; paper and its manufactures, 68,760,627; leather and its manufactures, 64,482,470; wood and bone manufactures, 80,323,740; glass and glassware, 72,810,451; iron, steel, and their manufactures, 66,537,975; other common metals and manufactures thereof, 75,788,965; machinery and electrical apparatus, 33,919,217; chemicals, drugs, and perfumery, 43,036,534. The trade in 1907 with the principal countries of origin and destination was as follows, in kronen:

From and to	Imports	Exports
Great Britain	238,529,000	222,247,000
Germany	979,535,000	1,176,802,000
France	83,014,000	73,456,000
Italy	122,580,000	193,303,000
Russia	137,778,000	78,213,000
United States	238,877,000	68,204,000
British East Indies	185,426,000	50,823,000

In the first nine months of 1908 the imports amounted to 372,276,828 kronen, against 361,242,560 for the same period in 1907, and the exports to 346,237,612 kronen, against 350,511,000 for the same period in 1907. The decrease in exports in 1908 is undoubtedly to be ascribed to the Turkish boycott. See **BALKAN QUESTION.**

COMMUNICATIONS. The number of ships entering the ports of the monarchy in 1906 was 146,438, of 19,499,615 tons; of those clearing, 146,367, of 19,467,221 tons. The Austro-Hungarian flag was represented by 123,044 ships, of 16,225,769 tons, among those entering, and by 122,960 ships, of 16,197,078 tons, among those clearing. The merchant marine in 1907 consisted of 14,755 ships, of 455,534 tons, with crews aggregating 41,039; the number of steamers was 393, of 403,301 tons, and of sailing vessels, 14,362, of 52,233 tons. The length of railways in Austria at the beginning of 1908 was 13,860 miles (including 352 miles of minor railways); 9,533 miles were operated by the State, 4,266 miles by private companies, and 61 miles were foreign. In 1908 it was reported that the Austrian government obtained control of the lines of three companies, aggregating 1,826 miles. The operation of the Austrian State railways in 1906 resulted in a deficit of 83,000,000 kronen. The annual deficit is due partly to the taking over of railways worked at a loss, partly to the construction of lines for purely strategical reasons, and partly to the policy of granting in certain cases minimum rates below the actual cost of operation, with the object of fostering certain industries. Thus the Austrian beet sugar industry owes its importance mainly to the great export trade, which amounts to three-fourths of the entire output. This export is rendered possible by the low railway rates. The railways in Hungary had at the beginning of 1907 a length of 13,557 miles, of which about four-fifths are operated by the State. In 1907 the supply of railway rolling stock proved inadequate. The government therefore proposed to devote 90,000,000 kronen from the public works loan to enlarging stations, completing certain railway lines, building new lines, and purchasing new rolling stock. The execution of a plan involving a cost of about 100,000,000 kronen for the

regulation of rivers was also to be begun within a year. The length of telegraph lines in 1906 was 26,652 miles in Austria, and 15,109 miles in Hungary.

FINANCE. The cost of administering the common affairs of the monarchy is borne by the two States in the proportion agreed on by their Parliaments and sanctioned by the monarch. From 1897 to 1907 the two Parliaments came to no agreement and the monarch had annually decided that the proportion should be that hitherto prevailing, namely, 34.4 per cent. for Hungary and 65.6 for Austria. In 1907 the agreement was renewed for a period of ten years. According to this agreement the net proceeds of the common customs shall be applied to the common expenditure, and to the remainder Hungary shall contribute 36.4 per cent. and Austria 63.6 per cent. The budget estimates for the common affairs of the monarchy for 1908 balanced at 396,165,603 kronen. The revenue from customs and the contributions from the two halves of the monarchy were estimated at 386,923,102 kronen, the remainder being covered from receipts of the various ministries. The principal items of expenditure were estimated as follows: Army, 319,931,164 kronen; marine, 57,285,000; foreign affairs, 13,964,547. The common debt, dating from before 1867, stood on Jan. 1, 1908, at 5,258,934,395 kronen.

In the budget of Austria for 1908 the revenue was estimated at 2,149,022,233 kronen, and the expenditure at 2,148,913,254 kronen. The principal estimates of ordinary revenue were: Land, house, industrial, personal, and other "direct" taxes, 323,552,000 kronen; customs, 130,410,000; excise, 356,307,200; salt monopoly, 47,552,000; tobacco monopoly, 243,957,800; stamps, 55,765,000; court fees, 109,787,200; lottery, 30,540,150; posts and telegraphs, 160,400,000; railways, 504,804,480. The principal estimates of ordinary expenditure were: Contribution to the common expenditure, 279,765,654 kronen; national defense, 76,712,227; worship and public instruction, 86,265,565; public debt, 405,239,477; posts and telegraphs, 136,831,800; railways, 380,461,070; public works, 60,266,087; justice, 81,148,531; civil pensions, 85,028,018. The public debt of Austria stood on Jan. 1, 1908, at 4,584,865,298 kronen.

The budget of Hungary for 1909 estimated the revenue at 1,555,777,976 and the expenditure at 1,555,729,907 kronen. The principal estimates of ordinary revenue were: Land, house, industrial, and other "direct" taxes, 240,822,000 kronen; excise, 246,835,000; salt monopoly, 34,899,000; tobacco monopoly, 144,152,000; stamps, 45,175,000; court fees, 70,323,000; profits from State domains, forests, mines, mint, etc., 132,590,234; posts and telegraphs, 75,185,000; railways, 327,470,000. The principal estimates of expenditure were: Contribution to common expenditure, 86,760,838 kronen; contribution to common debt, 60,619,340; Hungarian debt, 189,832,887; national defense, 48,548,723; worship and public instruction, 72,663,209; justice, 48,395,962; ministry of commerce, 339,167,240; ministry of finance, 228,047,567; administration of Croatia-Slavonia, 23,000,000. The public debt of Hungary at the beginning of 1907 stood at 5,554,763,524 kronen.

ARMY. The army is formed on the German model with the necessary modifications required by the dual nature of the monarchy. The first line of the Austro-Hungarian army is the "Common Army." The remainder of the forces are separate, and guaranteed so by the constitution,—that is, the Austrian Landwehr and Landsturm are entirely separate from the corresponding forces in Hungary. Military service is compulsory and universal for all citizens between nineteen and forty-two years of age in both countries. Continuous service in the common army lasts for three years, then seven years in the reserve, two years in the Landwehr reserve, after which the soldier goes to the Landsturm until the end of his liability to service. The military budget for the year 1908-9 carried a total of 488,108,653 francs, an increase of 26,307,789 francs from the preceding year. The contingent for the year was 103,100 men. The effective strength of the army was also slightly increased, to the following figures: Common Army, 22,395 officers and 293,823 men; Austrian Landwehr, 3,487 officers and 34,918 men; Hungarian Landwehr (Honved) 2,860 officers and 25,880 men; total, 28,742 officers and 354,621 men; aggregate, 383,363 of all ranks. The last authentic estimate of the war strength of the empire was 2,234,000 men.

The principal military events of importance in 1908 were the adoption of the new sharp pointed bullet, consisting of a steel point in a lead case, and the consequent adoption of a new powder, and resighting of the rifle; the completion of the rearmament of the field artillery with the new rapid fire gun introduced in 1905, and the reorganization of this branch of the service; the creation of ten sections of balloon troops, and experiments looking to the development of a system of attacking hostile airships; the large increase in the use of machine guns of which there will be 160 detachments with 364 guns in the service when the programme adopted in 1907 is completed; the substitution of an automatic pistol for the revolver; and the organization of a volunteer corps of automobilists and cyclists for scout and messenger service.

NAVY. The effective navy consisted, at the beginning of 1908, of 3 first class battleships, aggregating 31,800 tons; 3 second class battleships, 25,020 tons; 3 third class battleships, 16,800 tons; 6 armored gunboats, 2,400 tons; 3 armored cruisers, 19,000 tons; 7 protected small cruisers, 19,850 tons; 11 destroyers, 5,280 tons; 36 torpedo boats, 4,200 tons; total, 72 ships of 113,450 tons; and 14,535 men. The increase in tonnage in 1907 was 800. In addition there were 3 first class battleships, aggregating 44,000 tons, under construction. It was decided that Austria would in future build battleships of from 18,000 to 19,000 tons; those under construction in 1908 displacing only 14,500 tons.

GOVERNMENT. The Emperor-King Franz Josef I., born Aug. 18, 1830, became Emperor of Austria on Dec. 2, 1848, and King of Hungary on June 8, 1867. The common ministers at the end of 1908 were: Foreign Affairs, Baron Alois von Aehrenthal; Finance, Baron Stephan Burian de Rajecz; War, Baron Franz von Schönaich; Navy (section of War Office), Count Montecuccoli. The Premier of Austria was Baron von Bienenrath; of Hungary, Dr. Alexander Wekerle.

HISTORY.

MINISTRIES. In the dual monarchy the Ministry for Common Affairs was constituted as follows: Minister for Foreign Affairs, Baron von Aehrenthal; Minister of Finance, Baron Stephan Burian von Rajecz, and Minister of War, General von Schönaich. *The Ministerial Council for Austria:* Prime Minister, Baron von Beck; Minister of the Interior, Baron von Bienenrath; Justice, Dr. Franz Klein; National Defense, General von Latscher; Public Worship and Instruction, Dr. Marchet; Commerce, Dr. Fiedler; Finance, Dr. von Korytowski; Agriculture, Dr. Ebenhoch; Railways, Dr. Derschatta Edler von Standhalt; Public Works, Dr. Gessman. The representatives without portfolio were: Dr. Graf Dzieduszycki for Galicia; Prasek, Czech representative, and Peschka, German representative. Toward the close of the year, however, a ministerial crisis occurred and Prime Minister von Beck was succeeded by Baron von Bienenrath. *Ministry for Hungary:* Prime Minister and Minister of Finance, Dr. Alexander Wekerle; Interior, Count Julius Andrássy; Justice, Dr. Günther; National Defense, Ludwig Jekelfalussy; Public Worship and Education, Count Albert Apponyi; Commerce, Franz Kossuth; Agriculture, Dr. Ignaz Daranyi; Croatia, Slavonia and Dalmatia, Geza von Josipovich.

The main interest of the year 1908 centered in foreign affairs and especially in the unexpected annexation of Bosnia and Herzegovina in October, which produced a crisis in the Balkans, and for the time being threatened a European war. This event in its general European relations is discussed in the article on the **BALKAN QUESTION** (q. v.). The present discussion is confined to a narrative of the incidents in the Austro-Hungarian foreign policy, and to the record of internal affairs.

PARLIAMENT. It will be remembered that 1907 was the first year of Austria's experiment in universal suffrage. By the Electoral Law of Jan. 26, 1907, the Lower House is elected on the basis of universal direct equal suffrage. The qualifications of electors are, the attainment of twenty-four years of age and residence for one year in the district; and for deputies thirty years of age and three years of Austrian citizenship. In the general elections of 1907, the Socialists showed the largest gains; the Social Democrats numbering 83 and the Christian Socialists 67. One effect of the new system was said to be a tendency on the part of national parties to divide along new lines and to fall into the two larger groups of Social Democrats on the one hand and Christian Socialists and Conservatives on the other. Whether or not this was permanent, it was evident that the rivalries between the different nations were less conspicuous under the new system. For the first time in six years it was possible as the result of an election by universal suffrage to secure the consideration and voting of the budget in an orderly manner. In the course of the year there were signs of a tendency on the part of the Christian Socialist, Conservative and Agrarian interests to draw together against the rising tide of socialism, and it was thought that a *bloc* might be formed by these opposing parties for that purpose. The Agrarians and Clericals were in control of the Reichsrath during the 1908 session, and there seemed to be danger that the Liberal

groups would be crushed between the two extremes of Clericalism and Socialism.

The Vienna Municipal Council with the recognized Christian Socialist leader Dr. Lueger at its head, virtually controlled Parliament and threatened alike the von Beck ministry and the Liberal groups. Its chief aim was control of the universities, and its efforts to that end provoked a new Kulturkampf. Some years before, the Austrian episcopate, at the instance of the Vatican, had planned a Catholic University. But the university when finally established lacked an adequate faculty, and did not satisfy the Catholic aspirations in the matter of higher education. Once in power, the Clericals aimed to bring the universities under their own administration, subjecting the liberty of teaching to Church control. This aim was implied in an address by Dr. Lueger at the Catholic Congress. Great alarm was expressed in university circles, and at Innsbrück where the theological faculty is directed by the Jesuits, Dr. Wahrmond spoke against the project at a public meeting. Thereupon the Papal Nuncio demanded of the Minister of Foreign Affairs the dismissal of Dr. Wahrmond for this breach of the ecclesiastical peace. Baron Von Aehrenthal replied that he could not grant this request or permit a foreign power to meddle in questions of internal order. The Vatican did not uphold the Nuncio, who indeed had exceeded his rights; but the ultramontane party now took as their watchword dismissal of Wahrmond and the interdiction of his university teaching. University professors protested against this violation of the constitutional guarantee of freedom of research. Large numbers of the students sided with Wahrmond, and there were conflicts between them and the Clerical students at the University of Vienna in May. At Gratz further disturbances occurred at about the same time, owing to the attempt of some Catholic peasants under the leadership of Christian Socialist deputies to force their way into the university on the occasion of the granting of a decree. Innsbrück was also a centre of disturbance. Finally on June 5th a strike of the students occurred, and the courses in all the Austrian universities were suspended. The strike was due largely to the ambiguous position taken by the government. The Minister of Public Instruction was alone in declaring that he would not permit the independence of universities and the freedom of research to be curtailed. The Minister of Justice undertook to proceed against the book which contained the offensive remarks of Dr. Wahrmond. Parliament, however, was at that time busy with the consideration of the budget and anxious to restore peace. The Liberal groups in Parliament strove to quiet the students. Finally the matter was settled by the transfer of Dr. Wahrmond to Prague.

Among the social and economic questions which were awaiting an answer from Parliament was that of insurance against old age and illness. Six years before, the government had made certain investigations and estimates as to provisions for pensions, by a thoroughly responsible organization, to workmen already insured in existing associations. Now, however, a measure of insurance was demanded, also, by unorganized working men engaged in agricultural occupations and in independent trades. For these a different system was required, and the government was committed to some measure that would meet their demands. Another problem was pre-

sented by the necessity of an increase of salaries throughout the entire administration, and an increase in the pay of officers and soldiers. Here the Treasury was embarrassed by the question of raising the necessary revenue. The cost of maintaining the ponderous and old fashioned administrative system was much larger than in more effectively administered countries, as for example Great Britain. The cost is increased in Austria by the necessity peculiar to her of doubling the number of civil officers in the provinces where two languages are spoken equally. Hence the number of administrative officers is disproportionately large. It has been estimated that they exceeded tenfold the number required to do the same work in Great Britain.

The government wished to decrease the direct and increase the indirect taxation, but feared the opposition that such a measure would be likely to arouse. Many devices for raising money were considered by the Minister of Finance, for example, the increase of the duty on alcohol by fifty crowns per hectolitre and the raising of the rates on the national railways. The Socialists demanded an increase of the income tax. The action of the government was hindered by the fear of rousing the national rivalries. Another measure desired by the government but opposed by Parliament was a strengthening of the army. The Minister of War proposed the addition to the Landwehr each year of 5,000 men to take the place of that increase in the effective force which the government had been unable to secure on account of the opposition of Hungary. In case of war, these Landwehr recruits were to act as regular troops. The war ministry also desired the substitution of a two-year service for a three-year service, but here again were deterred from pressing the measure by fear of parliamentary opposition on the score of increased cost and by the risk of a renewal of the Hungarian demand for a national and territorial army, which would break up the common Austro-Hungarian military organization.

ANNIVERSARY CELEBRATIONS. The Emperor's Jubilee was celebrated throughout the empire on June 12th, by fêtes, processions and other ceremonies, and by the founding of charities for children and the aged. They were marked by many proofs of devotion on the part of the people indicating the almost patriarchal relation between their old sovereign and themselves; and by tacit consent the attempt was made to avoid anything that could provoke a political crisis during the Jubilee. It seemed for a time as if a truce had been concluded between the warring nationalities. An impressive feature of the celebration was the passing in review before the Emperor of 12,000 of his subjects, dressed in their diverse national costumes. The ceremonies were renewed on Aug. 18th, the seventy-eighth birthday of the Emperor. On this occasion an amnesty was granted to all persons convicted of *lèse majesté*; all first offenders sentenced to two weeks' imprisonment or 150 crowns fine and to 752 persons specified by name. Further celebrations took place on Dec. 2, the sixtieth anniversary of the Emperor's accession. At the illuminations in Vienna on this occasion a panic took place, resulting in the death or injury of several persons.

HUNGARY. On Jan. 1, 1908, the new Customs and Commercial Treaty, which was signed on Oct. 8, 1907, came into effect. This recog-

nized a separate but identical tariff in each country, and complete equality and freedom of action on the part of each. A court of arbitration was to be established to settle differences between the two countries; and Hungary was to redeem her part of the old joint debt by capitalizing her interest at a specified rate within ten years. Hungary consented to an increase of her quota for the joint expenditure from 34.4 to 36.4. Early in the year the question of the Hungarian franchise was discussed, but nothing definite was accomplished. The franchise, according to Count Andrássy's plan, extended the suffrage to all males over twenty-four years of age who could read and write Hungarian. Single voting was the rule, but two votes were allowed to those who paid a certain amount of direct taxation, and three votes to those who had attained a certain standard of education. The scheme also proposed a redistribution which would increase the constituencies, especially in Magyar districts. A dispute occurred in May over the pay of army officers, which threatened to cause strife in the Delegations. In the latter part of the month, however, an agreement as to the amount of increased pay was reached in a joint council of the Austrian and Hungarian ministers. Bills making important changes in the educational system were proposed by the Hungarian government. These included full instruction in the national schools, state support of private and religious schools, and the establishment of agricultural secondary schools for children from thirteen to fifteen years of age.

RACIAL CONFLICTS. The attempt to compromise the disputes between the Slav population and Magyars in Croatia was unsuccessful. The Croats obstructed all Parliamentary action, and in January the Hungarian Chamber drew up rules for the purpose of crushing out the Croatian and non-Magyar opposition. The new Ban, Baron Rauch, who arrived at Agram on Jan. 15, was received with stones and jeers. The result of the February elections was the return of forty-four members hostile to the Kosuth government. The new Croatian Diet was disorderly, and was dissolved by the Ban after two days (March 12-14). On April 12th Count Potocki, the Governor of Galicia, was shot and killed at Lemberg by a Ruthenian student. The Ruthenians had recently tried to gain for themselves an equal footing at the Lemberg University with the Poles. The Governor's alleged oppression of the Ruthenians was said to be the motive of the crime. On Nov. 29 rioting occurred at Prague, where a mob attacked the German students and professors and tore down the Austrian flag. The riots were renewed on Dec. 1. Resistance was offered to the troops; several persons were injured, and a state of siege was proclaimed. The disorders were the outcome of the Czechish movement, the Czechs being strongly in sympathy with Serbia and hostile to the Austro-Hungarian foreign policy. These and similar outbreaks that occurred in various parts of the Empire during the year showed the difficulty of any reform that aimed at complete autonomy for the different races. The representation of the races in the Cabinet, though it tended to promote harmony, had in fact its disadvantages. It was difficult for the Premier to control such a cabinet, owing to the necessity of compromising conflicting racial interests. To this composition of the Cabinet was attributed in part its vacillations

during 1908, and its inactivity. Its attention was absorbed in placating the opposing groups in Parliament, where each group bargained with the government in its own interest. It was only the feeling that universal suffrage was under test that prevented the lapse of the Reichsrath into the parliamentary inaction of the past.

There was considerable discussion during the year in connection with a new movement which, under the name of Triolism, aims at the substitution for the present dual organization of the Hapsburg territories, of a triple partnership consisting of Austria and Hungary as now, with the addition of a Slav Kingdom in the south to be formed out of the scattered Slavonic population at present included in Croatia-Slavonia, Bosnia, Herzegovina, Dalmatia, Carinthia and other south Austrian States. The plan was said to have the support of the heir apparent, Francis Ferdinand, but involved certain very obvious difficulties. Hungary would be unwilling to surrender Croatia-Slavonia over which she holds direct rule, and Bohemia, which is ambitious of being placed on an equal footing with Austria and Hungary, would press its claims more than ever if recognition was extended to the southern Slavs.

FOREIGN POLICY. The aggressive policy of the Austro-Hungarian Prime Minister, Baron von Aehrenthal, appeared first in the proposal of the Novi-Bazar Railway. He announced on Jan. 27th, that his government had been authorized by the Porte to build a railway through the Sanjak of Novi-Bazar, from the Bosnian frontier to Mitrovitz in Macedonia, which would connect Salonica directly with Vienna, thus establishing complete communication between Austria and Macedonia, and giving access to the sea. This gave rise to much discussion, especially in Russia, where the press attacked the measure as a violation of the Austro-Russian agreement of 1897. Russia retorted with a demand for a Russian-built line uniting the Danube with the Adriatic and passing through Servia and Scutari. To this the Austro-Hungarian government declared that there would be no objection on its part. The important bearing of this affair was in its relation to the programme for Macedonian reform and to the arrangement between Austria and Russia in regard to that matter. For an account of this and for further details as to the railway project, see the article MACEDONIA.

The chief event of the year, however, was the announcement by proclamation on Oct. 7th of the annexation of Bosnia and Herzegovina, which came shortly after Bulgaria had declared its independence of Turkey. The proclamation began by referring to the advantages that the two provinces had enjoyed under Austro-Hungarian administration. It then declared that the government intended to grant to both provinces constitutional institutions: that the inhabitants of the provinces should henceforth have a voice in their own affairs, and should continue under a separate administration. "But the indispensable premise for the introduction of this provincial constitution," says the proclamation, "is the creation of a clear and unambiguous juridical position for the two lands. For this reason, and also remembering the ties that existed of yore between our glorious ancestors on the Hungarian throne and these lands, we extend the rights of our suzerainty to Bosnia and the Herzegovina, and it is our will that

the order of succession of our house be applied to these lands also." The proclamation concluded with a promise of equal rights and equal protection for all creeds, languages and racial differences. This was followed by the announcement of the evacuation of Novi-Bazar by Austria and its retrocession to Turkey. Turkey immediately protested to the Powers against this violation of the treaty of Berlin. For the effect of this event on the Balkan question and on general European politics, see the article BALKAN QUESTION. Soon after the proclamation appeared, a new Diet for Bosnia and Herzegovina was ordered. The rescript declared that the new legislature should have control over the provincial administration and judiciary, and that it ought to be as fully representative as possible of racial, religious and political conditions. To this end it was required that the principal dignitaries, the persons of education and fortune, the inhabitants of the towns and those of the rural communes shall be represented in separate *Curia*; the electors of each voting separately according to creed, in order to preserve religious concord and assure to each creed its due proportion of representatives. It was later announced that the new Diet would contain fifty-two elected and twenty-eight official members, divided as follows: Serbs, 27; Mohammedans, 34; Catholic Croats, 19.

One of the interesting results of Austria's aggressive policy in the Balkans was considered to be its possible effect on the maintenance of the Triple Alliance for the present was asserted, in support of Austrian policy but in Italy Baron von Aehrenthal's acts aroused intense displeasure. The Austrian advance southward was regarded as a menace to Italian aspirations regarding the Adriatic coastland of Turkey. This was plainly brought out in the course of an important debate in the Italian Chamber, in December, where speakers of all parties agreed that Italy must be prepared for hostilities on her northeastern frontier, that is with her present ally, Austria-Hungary. The need of maintaining the Triple Alliance for the present was asserted, but at the same time it was made evident that with France now as the good friend of Italy, the chief reason for the Alliance had disappeared and Austrian pretensions were consequently subjecting it to an increasingly dangerous strain.

AUTOMOBILES. During 1908 a careful examination of the leading types of automobiles and motor vehicles revealed no striking improvements or innovation of a radical character, and it was generally assumed that the limit of development of the automobile practically had been reached. Naturally there was more extended use and application of the motor vehicle, while the policy of standardization by associations of manufacturers was developed, and the constantly diminishing price made possible by interchangeability of parts was bringing the machine to a wider circle of users. Moderate priced cars of medium size of 24 to 30 horsepower, selling from two to three thousand dollars, had a well merited vogue, and the year's output in this field exhibited greater reliability and durability. Automobile manufacturers in the United States succeeded in improving the character of their output so that by 1908 the best American cars not only could stand comparison with those of European mak-

ers, but for rough service showed greater durability.

During the latter part of the year the manufacturers of automobiles had completed their models for the ensuing year and were prepared to exhibit them in the winter's shows. The chief exhibitions, which previously had been held in November and December, were postponed until early in the following year in order that the latest developments and models might be shown by all manufacturers. But the machines themselves were already available for inspection before December, and indicated clearly the progress of the year and salient features of the 1909 model. As in previous years the tendency towards standardization and interchangeability of parts, characteristic of the work of the best American machine shops, was distinctly noticeable, and this had its effect in the more reasonable prices demanded for good cars and in the excellent character of the material used in their construction. The cars designed during 1908 and put on the market for the following year were, for the most part, moderate priced, and it was noted that over one-half of the probable output would be cars listed at \$1,500, or less. Accordingly, it is possible to describe a general type of automobile to which most of the makers approximate very closely. This typical, moderate priced car had a four-cylinder engine of from 20 to 30 horse power, and weighed from 1,500 to 2,000 pounds. The engine had water-cooled cylinders, and forced feed lubrication, with magneto ignition and batteries in reserve. The driving gear had a direct shaft with three speeds ahead and one in reverse, with a sliding gear transmission, and a leather covered cone clutch of some form was employed. The frame was made of pressed steel, riveted. The car would seat comfortably four people and had a wheel base of from 100 to 115 inches. The tires were 3½ inches on the front, and 4 inches on the rear wheels, and 34 inches in diameter.

The chief change to be noted from the models shown at the end of 1907, was the use by many manufacturers of the drop frame in the chassis, which serves to bring both frame and gear nearer the ground, so that the angle in the driving shaft at the universal joint is reduced. Full elliptic springs or three-quarter elliptic springs were preferred to the semi-elliptic springs hitherto used, and by many it was believed that the full elliptic would soon become standard practice. The four-cylinder engine throughout the year and for the new construction, was the prevailing type, and its field was not seriously invaded by the six-cylinder engine with its many good qualities, including power for climbing hills, of which much was promised at the beginning of the year. Naturally the four-cylinder engine was more economical in weight, space, simplicity and cost than the six-cylinder type. Ball bearings, extensively used on wheels, were beginning to be replaced by roller bearings, especially for the front wheels, and the gear drive was being used for fans, instead of the belt drive. The stroke of the engines was being lengthened, which gave a reduced shock and allowed the reciprocating parts to be made lighter. This advantage lessened the wear on the engine, and not only reduced weight, but also the amount of shock and vibration. During the year it became clear

that the over-powered machine of great weight was passing away, and even in racing, the light weight cars of moderate power covered the long distance courses at a rate that was only a few miles below the average speed of the heaviest and most powerful racing machines. During the year the tire manufacturers were able to turn out tires where the life was greatly increased, but this in large part was due to the use of lighter weight cars. There were also in use a number of detachable rims which gave satisfaction. The brakes of the various cars were being lessened in number, but improved in their quality and action. The increased and more general use of automobiles had its effect in the appearance of car bodies which were showing greater simplicity and refinement characteristic of the taste of the owners using such vehicles for purposes of general utility rather than for mere pleasure.

During the year there were a large number of low-priced cars put out, that is, cars ranging from \$500 to \$1,000, and for the most part, supplied with two-cylinder engines of the opposed horizontal type, while high-wheeled buggies and buckboards were extensively sold. Four-cylinder water-cooled engines with all the essential elements of the higher priced cars were provided in some of the excellent automobiles of the runabout type, which were put on the market at from \$800 to \$1,000.

During 1908 the new European automobiles also were shown for the ensuing year at the European shows. The greatest interest centered in the small low-priced, medium-powered cars, having either one, two or four cylinders. The chief characteristic of the motors of these foreign cars was the *en bloc* construction of the cylinders, where four cylinders were cast together. Two and three-bearing crank shafts were used, and also annular, ball and plain bearings upon the crank shafts. These small cars in Europe, as well as in the United States, made extremely high speeds during the races of the year.

One of the features of the year was the more extensive use of the automobile as a vehicle of commerce. Not that there was any particular novelty in such applications of the motor vehicle, but its successful use was making such progress as to indicate that tire and other difficulties were being solved. These commercial vehicles during the year had been developed to a system comparable with that of the best pleasure cars, and there was a wide variety of such vehicles on the market. In fact, in the Glidden Tour, one delivery van, subsequently exhibited at the winter's shows, covered 2,000 miles without any adjustment of its engines. The taxicab had become a recognized and profitable institution, and the success of motor cabs led a number of companies, as well as private individuals, to embark in the business. In London the police regulations require a systematic test and official sealing of the indicators, and there was a demand for similar measures in the United States. The use of motor fire apparatus showed a distinct increase during the year, particularly in the case of smaller cities, where by using high-speed cars carrying chemical tanks or gasoline engines of sufficient power, the amount of protection rendered by a fire department, and its radius of effective action, were considerably increased. The city of Spring-

field, Mass., put in operation a number of motor fire vehicles during the year, while extensive use and tests have been made by the post office departments in Europe and the United States.

In Japan and China the automobile had become an established feature, and in the former country the improvement of the roads, which are narrow and heavy, was being demanded. During the year 1908 the automobile gained admittance into Turkey as one of the political innovations of the year, despite, it was said, the prejudice of the Sultan. In Siam, American automobiles were being used and the motor car had the support of the King.

The motor car industry in the United States by 1908 had reached large dimensions. For that year it was estimated that \$122,000,000 worth of cars had been sold, as compared with less than \$8,000,000 in 1903, and the amount of money involved in the production of this output was believed to have exceeded \$467,000,000. This, of course, included the actual money paid, the shift of credits or the turn over of business in the different establishments and the disbursements incident to activities and new developments which resulted from the use of motor vehicles, without considering the detailed expenditures of the business. The actual capital was estimated at about \$200,000,000 and the number of people employed at nearly 110,000. At the beginning of the year it was estimated that 146,000 automobiles were in actual use in the United States, and for their operation were required fuel, lubricants and other supplies, aggregating millions of dollars, as well as the service of chauffeurs and mechanics and various operations incident to replacements and repairs. In addition, the license fees contributed to States and municipalities amount to a considerable figure, while the use of property or private stables supplies another important item. At the end of 1908 it was stated that probably eighty automobile makers were the large and real producers of the country, in addition to whom there were over 200 attempting to manufacture machines, with a greater or less probability of success. During 1908 the business naturally felt the general trade depression, but manufacturers and dealers endeavored to be conservative, and in most cases came through successfully.

The sale of automobiles in the United States during 1908 was estimated at over 52,000. Twenty-nine States required compulsory registration of automobiles, and returns showed that over 250,000 cars had been registered. New York had 64,500 cars; Pennsylvania, 25,129; California, 19,375; New Jersey, 19,021; Massachusetts, 17,439; Illinois, 17,296. During the year the export business in automobiles had been developed to a considerable extent. The estimate of automobiles in the United States constructed and in use at the end of December, 1908, was over 300,000.

The claims of the American car were being pushed vigorously during the year 1908, and returns showed that while foreign cars were being employed in some of the eastern cities, notably New York, with success and satisfaction, taking the roads of the country by and large, the American cars were found more suitable for the rough work demanded. Accordingly, it was claimed that the developments of the American car had been, from the beginning, on a basis

of practical utility, and despite statements to the contrary, original designs had been evolved rather than an imitation of foreign makers' work.

The United States produces annually about 80,000 automobiles, Italy, 25,000, and France, 40,000. Germany and England are also builders, but to a less extent than the two European countries specified. In 1908, 1,416 foreign automobiles were entered at the port of New York. Of this number 533 were pleasure vehicles, consigned to dealers; 553 were taxicabs; 19 trucks and busses; 16 cars in bond; 144 new cars not used, imported by individuals, and 151 old and second-hand cars reimported.

The automobile, like other industries, figured in the proposed revision of the tariff, and a hearing was held on this subject before the Ways and Means Committee in November. There was a duty under the Dingley law of 45 per cent. on foreign automobiles, and a reduction of this to 30 per cent. was demanded on behalf of those interested in the importers' Salon. This reduction was opposed by the American manufacturers, who claimed that they had not made exorbitant profits and that only a relatively small number had made any profits at all. Of the 51 concerns interested in the business in 1902, only 21 were in existence at the end of 1908, while during the five years period from 1902, 155 manufacturers discontinued business. It was claimed that the industry deserved protection, both from the normal production and from the overproduction of the European factories, with cheap labor,—considerably less than half what it is in the United States—low rates of taxes, and preferential rates on manufacturing machinery. The manufacturers claimed that the tariff rates should afford ample protection to American made goods and provide a customs duty on imports equal to the difference in the cost of production in the United States and in Europe. They denied that the Trade Associations were in the hands of trusts and that the individual members were engaged in competitive business, and that prices were not governed by trade agreements.

RACING EVENTS. In the United States the chief racing events of the season were: The Savannah Challenge Trophy Race (360 miles), the Briarcliff Trophy Race (240 miles), the Ames Trophy Race (254.4 miles), the Founders' Week Cup Race (195 miles), the Vanderbilt Cup Race (258.06 miles), and the Grand Prize of America Race (400 miles). The first three events mentioned were all won by Strang, who drove a 50 horsepower Italian Isotta in the Savannah Challenge and Briarcliff Trophy races and a 65 horsepower Isotta in the Ames Trophy. His best average was 54 miles per hour in the Ames Trophy. The Founders' Week Cup Race was won by Robertson in a 40 horsepower Locomobile, his average being 48.25 miles per hour. A part of the fourth Vanderbilt Cup Race was run over the new Long Island Motor Parkway Course, which it was expected would be entirely completed in 1909. This race was won by an American car for the first time, the winner being a 120 horsepower 1906 Locomobile, driven by Robertson. The time was 4 hours, 48 1-5 seconds, an average of 64.3 miles per hour. An Italian Fiat, driven by Wagner, won the first international race for the Grand

1908 Type of large combination fire wagon

Combination Car with chemical tank and hose used by the Springfield, Mass., Fire Department

AUTOMOBILE FIRE APPARATUS

Prize Cup in 6 hours, 10 minutes and 31 seconds, an average of 65.5 miles per hour.

The principal European contests were the Grand Prix in France (478.1 miles), which was won by a 120 horsepower Mercedes, driven by Lautenschlager, in 6 hours, 55 minutes and 43 seconds, an average of 69.24 miles per hour; and the race for the Florio Cup in Italy (328.8 miles), which was won by a 123 horsepower Fiat, driven by Nazarro, in 4 hours, 25 minutes and 21 seconds, an average of 74.3 miles per hour.

The New York to Paris Race, run under the auspices of the *New York Times* and *Le Matin*, Paris, was started from Times Square, New York City, on February 12. The entries included three French cars, one German, one Italian and one United States. The race was won by the United States car, a Thomas, which covered a distance of 12,116 miles in 112 days. The Protos (German) was second, running 10,887 miles in 130 days.

Notable track achievements during the year were the establishment of a record (heavy-weight) of a mile in 51 seconds by a 60-horsepower Fiat, driven by De Palma at St. Paul, Minn., on September 5; and the running of 1,177 miles in 24 hours at Brighton Beach, N. Y., on October 2 and 3, the drivers being Robertson and Lescault and the machine a 50 horsepower Simplex. In the straightaway free-for-all gasoline contests held at Ormond, Fla., on March 5 and 6, Bernin drove a 60 horsepower Renault 100 kilometres in 1 hour, 12 minutes, 56½ seconds and Cedrine drove a 60 horsepower Fiat 300 kilometres in 3 hours, 53 minutes, 44 seconds.

AVIATION. See AERONAUTICS.

AYBTON, WILLIAM EDWARD. An English physicist and electrical engineer, died on Nov. 8, 1908. He was born in London, on Sept. 14, 1847, was educated at University College, and in 1867 entered the Indian Government Telegraph Service. For a year he studied electrical engineering under Lord Kelvin, in 1868 became Assistant Electrical Superintendent, and, in 1871, Superintendent of the Telegraph Department at Bengal. With Lord Kelvin and Professor Fleeming Jenkins, he superintended the manufacture of the Great Western Telegraph cable in 1872. He was professor of physics and telegraphy at the Imperial College of Engineering, in Tokyo, Japan, in 1873-79, when he became professor of applied physics at the Finsbury College of the London Technical Institute, where he remained until 1884. He then became professor of electrical engineering in Central Technical College, at South Kensington, where he served during the remainder of his life. With Professor John Perry, who was his associate in Japan, and afterward in London, he invented many instruments for measuring electrical quantities, and devised some of the earlier applications of electricity to tramways in England. For these and other achievements he was awarded a medal by the Royal Society in 1901. He had published numerous papers on electrotechnics, and also *Practical Electricity* (1888), which has gone through many editions.

BABYLON, EXCAVATIONS IN. See ARCHÆOLOGY.

BACKUS, TRUMAN JAY. An American educator, died on March 25, 1908. He was born in Locke, Cayuga County, N. Y., on Feb. 11, 1842.

He was educated in the public schools of New York City, and at the University of Rochester, where he graduated in 1864. For about a year after the Civil War he was actively interested in educational work among the freedmen, and he was one of the organizers of the first school for negroes in Richmond, Va. From 1867 to 1883 he was professor of rhetoric and English literature in Vassar College, and with Dr. John H. Raymond, the first president of Vassar, and Miss Maria Mitchell, professor of astronomy, aided in the reorganization of the institution. He became president of the Packer Collegiate Institute, in Brooklyn, in 1883, and occupied that position during the remainder of his life. In 1894-97 he was a member of the Brooklyn Civil Service Commission, and he was also associated with the management of other local and state institutions, notably the Long Island City Hospital. In 1905 he was president of the Association of Colleges and Preparatory Schools of the Middle States and Maryland.

BAGDAD RAILWAY. See TURKEY.

BAHAMAS. A chain of twenty inhabited and many uninhabited islands, southeast of Florida, constituting a British colony. Total area, 4,404 square miles. Population (1901), 53,735, mostly negroes. At the end of 1907 the population was estimated at 59,713. Nassau, on New Providence, is the capital. The cultivation of sisal is rapidly increasing, its acreage being now over 25,000. The export of sisal in 1907 was valued at \$46,669, against \$40,140 in 1906. The export of cotton in 1907 was 8,568 pounds. The cultivation of pineapples, oranges, tomatoes, and other fruits and vegetables is also on the increase. Other products are sponges, of which the exports in 1907 were valued at \$129,699, turtle-shell, mahogany, logwood, ebony, tobacco, and cotton.

The total imports and exports in 1907 were valued at \$372,937 and \$233,232 respectively, against \$329,115 and \$221,925 in 1906. The revenue in 1907 was \$89,694; the expenditures, \$79,790; and the public debt, \$66,680. The Governor in 1908 was Sir William Grey-Wilson. A hurricane on September 11-13 caused much destruction. Nearly all the houses of Clarendon were destroyed and a great many vessels were wrecked.

BAILEY, LIBERTY HYDE. An American agriculturist and educator, appointed chairman of the Commission on Country Life, by President Roosevelt, in 1908. He was born in South Haven, Mich., on March 15, 1858; graduated at the Michigan Agricultural College in 1882, and in 1882-83 was assistant to Asa Gray at Harvard. He was professor of horticulture and landscape gardening at his alma mater in 1883-88, and professor of horticulture at Cornell in 1888-1903, when he became director of the College of Agriculture at that university. Professor Bailey is recognized as one of the foremost authorities on scientific farming and gardening, and as a man who makes effective use of the most advanced agricultural theories and processes. He has produced, or edited, much first-class literature on his subjects, including such books as, *Annals of Horticulture in North America for the Year 1893* (1894); *Nursery-Book* (1896); *Principles of Agriculture* (1898); *Sketch of the Evolution of Our Native Fruit Trees* (1898); *Survival of the Unlike* (1901);

Lessons with Plants (1902); *Garden-Making* (1904); *The Nature-Study Idea* (1903); *Plant-Breeding* (1906); *Forcing-Book: a Manual of the Cultivation of Vegetables in Glass Houses* (1908); and *The State and the Farmer* (1908); and he has edited the volumes thus far published of *The Cyclopædia of American Agriculture* (1907). See AGRICULTURE.

BALCH, GEORGE BEALL. An American naval officer died at Raleigh, N. C., on April 16, 1908. He was born on January 3, 1821, at Shelbyville, Tenn., and entered the navy in 1837 as acting midshipman. In the Mexican war he was present at the capture of Vera Cruz and the attack on Alvarado. He was assigned to the Asiatic squadron in 1850 and was wounded at Shanghai while protecting the foreign residents during the Chinese civil war. At the outbreak of the Civil War he was an instructor at Annapolis, but was immediately ordered to sea duty and served throughout the war on the Atlantic Coast, commanding at different times the *Sabine*, *Pocahontas* and *Pawnee*. While in command of the *Pawnee* he particularly distinguished himself at the battle of Stono, July 16, 1863. He had become commander in 1862, was made captain in 1866, commodore in 1872 and rear admiral in 1878. In 1883 he retired and made his home in Baltimore. For the last six years of his life he was the senior officer on the retired list of the navy.

BALKAN QUESTION. The Balkan peninsula, the easternmost of the three great southern peninsulas of Europe, comprises, as ordinarily defined, European Turkey, Bulgaria (including Eastern Rumelia), Servia, Montenegro, Bosnia, and Herzegovina, the Turkish district of Novi-Bazar, and Greece. The history of these separate divisions will be found under their respective titles, and for the course of events down to October, 1908, see especially the articles MACEDONIA and AUSTRIA-HUNGARY. The present discussion is concerned only with the crisis in Balkan affairs that arose in the first week of October. At that time in quick succession occurred three events which occasioned the most serious European crisis in recent years. These were the Bulgarian declaration of independence, the Austrian annexation of Bosnia and Herzegovina and Crete's declaration of union with Greece.

THE BULGARIAN DECLARATION OF INDEPENDENCE. In the middle of September ill feeling arose between Turkey and Bulgaria over the failure of the Grand Vizier to ask the Bulgarian representative to the dinner given by the Turkish Minister of Foreign Affairs in honor of the Sultan's birthday. In answer to the inquiry addressed by the Belgian government to the Porte, it was replied that the dinner was given only to diplomatic representatives having the rank of Minister, whereupon the Bulgarian agent was withdrawn. The Turkish government protested in vain that no offense was intended, but by implying that Bulgaria was regarded as a vassal state Bulgarian pride was hurt, and a feeling of hostility engendered at the very time when the new régime in Turkey should have spared no pains to avoid adding to its difficulties. Its action on this occasion was criticised as a serious mistake, though it was admitted to be the first mistake that the Young Turk party had thus far committed.

Meanwhile a strike had broken out on the Oriental Railway between Sofia and Belgrade, which belongs to Turkey, even after it enters Bulgarian territory, Bulgaria controlling only a small part of the line near its termination at the Bulgarian capital. Turkey's rights in the railway rested on Article 21 of the Treaty of Berlin, which declares that Turkey should retain all rights over the railways of Eastern Rumelia. The operation of the road was given by Turkey to the Oriental Railway Company. Urging as a reason the delay and damage caused by the strike, the Bulgarian government caused the military occupation and operation of the line. After the strike ended Bulgaria still retained control, and when the representatives of the company protested, the Bulgarian government declared that economic interests and the national defense dictated this action; that it must retain control, and that it would negotiate directly with the company and not with the Turkish government. On September 23 a note from the Porte was delivered at Sofia, calling attention to the continued military occupation of the line. On the following day the Bulgarian government replied that it occupied the line under arrangement with the company and was accountable only to the company. The Porte thereupon addressed a note to the foreign ambassadors at Constantinople, calling attention to this violation of the Treaty of Berlin, and requesting their intervention for the return of the road to the control of the company. The Bulgarian government, however, showed no intention of evacuating the line. This action on its part was criticised by the European press as indicating a readiness to profit by the internal difficulties of Turkey, and to embarrass the new régime. This criticism was redoubled by the sudden and unexpected action of Bulgaria a few days later. On Oct. 5, Prince Ferdinand read a solemn manifesto at Tirnovo, the ancient capital of Bulgaria, declaring Bulgaria's independence of Turkey; and was thereupon hailed by the people as Czar of the Bulgars. Bulgaria and Eastern Rumelia were declared to be thenceforth an independent united kingdom. When the news reached Turkey it was received by the press with comparative mildness and the attitude of the Young Turk partly surprised Europe by its moderation. There was no appeal to warlike sentiment. European criticism of Bulgaria's action was directed more against the manner and the circumstances in which it had been brought about, than against the action itself. Bulgaria was already in fact independent. In demanding the name in addition to the reality of independence at this time, she was criticised severely for her apparent desire to add to the difficulties of Turkey, and for her indifference to the interests of her neighbors. It seemed a needless blow at the new régime of Turkey; and it was attributed by many to jealousy of the Turk rather than to patriotism, for it was argued that the same object could have been attained by peaceful negotiations at a later time. It struck at the prestige of the new Turkish government by taking away in appearance at least a part of the empire thus identifying the triumph of the Turkish revolution with the loss of national power.

It will be remembered that the Treaty of San Stefano, which concluded the Russo-Turkish

war, created a great Bulgarian principality extending from the Danube to the Mediterranean. But by the Treaty of Berlin the area of Bulgaria was greatly reduced and the region known as Eastern Rumelia was placed under Turkish administration, though with a modified autonomy. By the Treaty of Berlin, Bulgaria, though it received autonomy, and was guaranteed against Turkish oppression, remained a vassal state of Turkey. In 1885, Bulgaria virtually annexed Eastern Rumelia, which, however, continued to pay tribute to Turkey. Alexander of Battenburg, the Prince of Bulgaria, was appointed Governor-General of Eastern Rumelia for five years, and this appointment was regularly renewed both to him and his successor Ferdinand, becoming a mere matter of form. Through the policy of Alexander and Ferdinand, and the latter's able premier Stambouloff, Bulgaria acquired virtual independence, and in relation with the European powers generally was recognized as an independent state. As to Eastern Rumelia, the appointment of Ferdinand as Governor-General was gradually discontinued and the incorporation of Eastern Rumelia with Bulgaria was recognized as an accomplished fact. Meanwhile there had always been the dream of a Greater Bulgaria with access to the *Ægean* Sea. The Bulgarians were the preponderant element in the population of the Macedonian vilayets. There was always the hope that the Macedonian problem might be solved in Bulgaria's interest. The constant state of warfare in Macedonia and the fear of Turkey had made the building up of an effective army necessary, and this policy had been carried on steadily and with success. At the time of Ferdinand's declaration of independence, the Bulgarian army was reputed to be in excellent condition, and in marked contrast to the ill paid and disorganized military forces of Turkey.

AUSTRIAN ANNEXATION OF BOSNIA AND HERZEGOVINA. On October 7, after a preliminary notice to the Powers of his intention, the Emperor Francis Joseph addressed an imperial proclamation to the people of these provinces, declaring that they were thenceforth his subjects and promising them a constitution. By way of compensation it was announced that the Sanjak of Novi-Bazar would be given back to Turkey. Here again it was more of a change in words than in actual facts. The occupation of Bosnia and Herzegovina had been granted to Austria by the Treaty of Berlin. Since that time the Austrian occupation had continued without question, and large sums of money had been spent in the building of railways and in the economic development of the province. No one supposed that the final outcome of this arrangement would be other than incorporation in the Austro-Hungarian Empire. But the time and occasion of the annexation were unfortunate. In Turkey, grave fear was felt lest the effect of the act would be an injury to the Young Turk party, and aid the cause of the reactionaries. Turkey at once addressed a note to the Powers, complaining of this violation of the Treaty of Berlin. It declared that though it could resort to force on behalf of its rights, it desired to avoid that extremity, and therefore appealed to the Powers. The news caused great excitement in Serbia and Montenegro. In Serbia there was at first a distinct manifestation

of warlike feeling; and in Montenegro it was announced that that country would join Serbia if Austria made war. Prince Nicholas of Montenegro issued an address to his people, saying that if violation of the Treaty of Berlin were permitted to Austria, there was no reason why Montenegro should respect that clause of the treaty (Article 29) which debarred her from rights to a littoral. In both states the fear was expressed that they would find themselves entirely hemmed in by Austrian territory. The ill feeling was intensified by the detention of the Montenegrin envoy, who was on his way to Belgrade; but he was soon set free and the Austrian government afterwards expressed regrets. Meanwhile Great Britain had won the gratitude of Young Turkey by declaring her refusal to recognize the violation of the Treaty of Berlin. In reply to a note from Montenegro protesting against the annexation, Sir Edward Grey declared it to be a violation of the treaty, which could not be altered without the consent of the signatories. Russia assured Serbia and Montenegro that if a conference were held she would safeguard their interests. In reply to the Turkish protest, she declared her acquiescence in the view that the annexation was a violation of the treaty. It was reported that Italy took the same view as to the annexation, and would agree to a conference.

CRETE'S ACTION. Meanwhile, on the same day that the Austrian announcement was made, the Cretan authorities, in response to the popular demand, proclaimed Crete a dependency of Greece. This, also, was immediately followed by a protest from Turkey. The union with Greece was formally voted by the Cretan Chamber on October 12. This, however, did not threaten to cause any serious difficulty. The four protesting powers, namely, France, Great Britain, Russia and Italy, informed the Cretan government that they would consider the question, and make it the subject of negotiations with Turkey, provided that order was maintained in the island and the Moslems were unmolested. Both the Cretan and the Greek governments showed a spirit of acquiescence, and the former, in an address to the people, urged them to maintain order and respect the rights of the Moslems in conformity with the instructions of the protecting Powers.

COMMENTS ON AUSTRIA'S ACTION. Austria's sudden annexation of the provinces caused much comment, most of it sharply critical, and many explanations of her foreign policy were offered. It was commonly remarked that under Baron von Aehrenthal, who was frequently likened to Bismarck, Austria had at length departed from her conservative and cautious attitude and was now embarked on an aggressive policy, or as some called it, a policy of adventure. She was believed to have had for her steady aim the securing of access to the *Ægean* at Salonika, but to have been thwarted in this aspiration for the extension of her territory by internal difficulties and the danger of adding to the already large Slav element in her population, also by the fear of disrupting the Triple Alliance and of trouble with Italy over the Albanian question if Macedonian territory were annexed. It seemed to be to her interest to prevent the political or economic union of the Slav states, lest the presence of a powerful Slav dominion in her neighborhood of the same race as mill-

ions of her own subjects, and the Russians, should endanger her own safety. Hence, she had long been accused of a desire to keep Turkey in an enfeebled condition and to prevent any adjustment of the Macedonian difficulties. To these motives were attributed the agreement with Russia in 1897 for the maintenance of the *status quo* in the Balkans, and the ineffectiveness of all reform measures in Macedonia under the Mürzsteg programme of 1903, whereby Russia and Austria were to act as mandatories for putting the reforms into effect. It was said that neither of these Powers really desired reform, and that all advantages that accrued came from the pressure of Great Britain, France and Italy. Austria's action in the matter of the Novi-Bazar Railway was interpreted by these critics as a betrayal of the Concert of the Powers in the matter of Macedonian reforms (see MACEDONIA). It was pointed out that as soon as any real measures of reform seemed imminent, as, for example, those proposed by Sir Edward Grey and by the Russian government early in the year, Austria, by dealing separately with Turkey in the matter of the Novi-Bazar Railway, made effective co-operation in Macedonia impossible, and this was explained on the ground that Austria feared that the Powers would solve the Macedonian problem by giving the provinces self-government under European protection, and that this would mean Bulgarian control, the Bulgarians being the largest element in the population, and thus raise a barrier of race between Austria and Salonika. By the annexation of Bosnia and Herzegovina, Austria confirmed these critics in their view as to her longcherished designs, and as to her adoption of a forward policy.

Two years under universal suffrage, and the quieting of her race feuds, had placed Austria in a better position for such aggressive action. Russia and Turkey both had revolutionary movements on their hands and the chance of serious opposition was slight. New personal forces had begun to appear in the government, and the Emperor's restraining influence was less manifest in the direction of public affairs. The Archduke Francis Ferdinand, the heir-apparent, was said to be taking a more active part in politics and to be in favor of aggressive action. Baron von Aehrenthal had succeeded Count Goluchowski in 1906, and although at that time it was thought that he would pursue, in general, a conservative foreign policy, which, in the main, would be favorable to Russia, where for many years he was an attaché at the Austrian embassy, his course had been directly the reverse of what was expected. Within two years he had divided Bulgaria and Serbia, endeavored to strengthen the Triple Alliance, terminated the Russo-Austrian agreement of 1897, developed the plan of Austrian expansion by the Novi-Bazar Railway, and finally, by the annexation of Bosnia and Herzegovina, nullified the Treaty of Berlin. The general tendency of this policy had been manifested before the Turkish Revolution. As a result of the Turkish changes it seemed the more desirable. The annexation was interpreted by many as proceeding from the fear that a regenerated Turkey would, by hastening the establishment of order in Macedonia, stand in the way of Austrian expansion; and it was pointed out that the

weakness of Turkey in her experiment with constitutional government, afforded Austria her opportunity. The aims of Austria were, it was said, to foment strife in the Young Turk party and favor reaction. The prestige of this party would be seriously injured if the first result of its success were the loss of part of the Empire. Austria hastened to approve the Bulgarian declaration of independence, and, it was charged, had indicated her approval in advance. By this course she secured the good will of Bulgaria, and forestalled the possible union between Bulgaria and Serbia against her own annexation of Bosnia and Herzegovina. In giving back Novi-Bazar to Turkey she drove another wedge between Slav nationalities, dividing Serbia and Montenegro. The ideal of a Greater Serbia had been gaining strength during the last two or three years, and was now the dream of some nine million persons, of whom two-thirds are Austro-Hungarian subjects. The Serbs in Bosnia and Herzegovina, Croatia, Novi-Bazar, Dalmatia, Serbia, and Montenegro have shown a tendency toward concentration, and there have been signs of a concerted movement against Austro-Hungarian domination. In defense of annexation, on the other hand, it was argued that it could have been no surprise to the signatories of the Treaty of Berlin, as it was the inevitable outcome of the occupation of the provinces accorded to Austria by that treaty. It was not to be expected that after an administration of the provinces for so many years, and the expenditure of vast sums in the railway and economic development of the country, Austria would ever evacuate them. The ostensible reason for proclaiming the annexation at this time was that the inhabitants of the provinces would naturally desire the constitutional privileges possessed by their immediate neighbors in the Empire, and that these could be granted to them only by making them Austrian subjects. As a result of these events, Baron von Aehrenthal became, for the time, the leading and most discussed personage in European politics. Estimates of his statesmanship varied greatly. In some quarters he was hailed as a new Bismarck, and in others regarded as a merely spectacular politician, whose achievements would bring no lasting advantages.

PLANS FOR ADJUSTMENT. The first suggestion for a settlement of the difficulties looked to a conference of the signatory Powers to the Treaty of Berlin. It was urged that, the treaty having been grossly violated by Bulgaria and Austria, such a conference afforded the natural and proper means of readjustment. On the other hand, it was argued that the situation was very different from that which prevailed before the Treaty of Berlin; that recent events had effected no change except in form; that a conference would imply that other matters determined by the treaty were open for discussion, and that the separate nations would gather there, each eager to gain something for itself. It was soon evident, however, that France, Russia and Great Britain desired a conference. When the annexation was announced, M. Isvolsky, the Russian Foreign Minister, was in Paris. He went immediately to London and there conferred with Sir Edward Grey. It was agreed that a conference was necessary, but that it should be limited in scope, confining itself to the recent violations of the treaty. If

AFFAIRS OF AUSTRIA-HUNGARY**

the treaty were open to discussion in other respects Russia would naturally desire to bring up a point of great interest to her, namely, the opening of the Dardanelles to her vessels. This, however, would lead to demands of the other Powers for concessions, and it was understood that Russia would not bring up this question if a conference were held. The British government, however, promised to raise no objections to the opening of the Dardanelles, if Turkey would agree to it, and expressed a willingness even to recognize the right of passage in times of peace to all the riparian Powers on the Black Sea. The proposals as to the points that should be submitted to the conference mysteriously leaked out and were published by the press in substantially their actual form. They included the determination of the status of Bulgaria and of the provinces of Bosnia and Herzegovina; the determination of the financial compensation from Bulgaria to Turkey, and of the nature of the compensation due to Turkey from Austria; the consideration of an arrangement for closing the foreign post-offices in Turkey and modifying the capitulations; the determination of the status of Crete; the modification of the articles of the Treaty of Berlin, affected by the recent events, and the consideration of the question of compensation to Serbia and Montenegro, both of which States desired territorial compensation, Montenegro demanding in addition a change in Article 29 of the treaty. The plan for a conference, however, did not prevent the Powers from advising direct negotiations with Turkey, which would smooth the way for a settlement of the points at issue.

On Oct. 27, Great Britain, France and Russia presented an identical note to the Bulgarian government, advising Bulgaria to send an envoy to Constantinople to arrange an equitable basis of compensation and urging the Bulgarian government to abstain from military measures. This action was approved by the German and Italian governments. The Bulgarian government had already declared its intention to abstain from warlike measures and had afforded evidence of this by disbanding some of the Reserves. Later it disbanded 50,000 of the Reservists and sent an official representative to the Turkish government. Serbia, however, was reported to demand, not only territorial compensation, but the bestowal of autonomy on the provinces, and Montenegro was said to have agreed to this. By Oct. 27, the Austro-Hungarian troops had evacuated Novi-Bazar. In Russia, public opinion, as expressed in the newspapers, seemed inclined to favor a conference, but on the condition that Austria should permit the discussion of the annexation. It was reported that Serbia and Montenegro had formed a military convention. Early in November the Servian Crown Prince and the President of the Montenegrin Upper Chamber visited St. Petersburg and returned to Belgrade on Nov. 7. The Servian Crown Prince, declared soon afterwards that he had obtained from the Czar and the Russian nation expressions of their sympathy and that he hoped for their support in Serbia's struggle, but that even if others did not aid them, the Servians must defend their rights in war. This appeal was received with popular enthusiasm. On Nov. 18 the programme of the Porte for a conference,

as communicated to the Powers, was published. It comprised the following points: (1) The status of Eastern Rumelia; (2) the status of Bulgaria, and the amount due Turkey on account of the unpaid tribute, the share of the Ottoman debt and the arrears of the Eastern Rumelia tribute; (3) the status of Bosnia and Herzegovina; (4) compensation to Serbia and Montenegro; (5) abrogation of Articles 23 and 61 of the Treaty of Berlin, which were virtually annulled by the establishment of constitutional government in Turkey; (6) the modification of the Capitulations. Finally, it was said that Turkey would offer no opposition to the modification of Article 29, proposed by the Montenegrin government.

SITUATION AT THE CLOSE OF THE YEAR. From the first, Austria took the position that the only Power concerned in the question of compensation was Turkey, and that Austria was prepared to negotiate with her on the subject. Negotiations were begun but were interrupted by the friction between the two governments arising from the boycott of Austrian goods in Turkish ports which was started soon after the news of the annexation reached Turkey, and which was very effectively carried out. Consumers refused to purchase Austrian goods and merchants refused to sell them. In the various ports, porters refused to carry the merchandise from Australian vessels to the custom houses. The Austrian government protested, but in spite of the assurances of the Turkish authorities, the boycott continued. In the last week of November the Austrian government declared that it would not resume negotiations unless the boycott ceased, to which the Turkish government replied in effect that the boycott proceeded from private individuals and was beyond the government's control. Nevertheless, in spite of the continuance of the boycott, Austria announced on Dec. 13, that it would resume the interrupted negotiations, in consequence of the declaration on the part of the Porte, that due instruction had been given to the customs authorities and that it would do all in its power to check the boycott. In taking this action Austria declared that the Turkish government would be liable to indemnify Austria for any damages caused by the failure of the Porte to fulfil its obligations. On Dec. 21 the negotiations were resumed. Meanwhile Bulgaria had opened negotiations with the Turkish government in November, and toward the end of that month it was reported that all pending questions between Bulgaria and Turkey had been fully discussed, and principles agreed upon by the representatives of both governments promising a satisfactory settlement. As to the proposed conference, the harmony between the Turkish proposals and those of France, Germany and Russia, seemed to indicate that a conference under these limitations was probable. It was reported that Austria would require a preliminary exchange of views with the European cabinet as to the annexation. At the close of the year the outlook was favorable to a peaceful adjustment of the points at issue, although some incidents caused uneasiness, for example, a protest to the Powers on the part of Bulgaria against what was described as the offensive tone in the Sultan's speech from the throne of the reference to Prince Ferdinand, and at about the same time a meeting of the

merchants of Montenegro, which resolved on a boycott of Austrian goods. In December it was announced that the Montenegrin government in a note to the Powers declared that since Article 49 of the Treaty of Berlin had been cancelled, Spizzsa (in Dalmatia) had no further value to Austria and that Montenegro demanded it. It would not, however, be taken in lieu of any compensation for the Montenegrin and Servian demands.

BALLOON. See AERONAUTICS.

BANKS, SIR JOHN. An Irish physician, died in Dublin, on July 16, 1908. He was born in Dublin, and when he matriculated at Trinity College, in that city, gave his age as 20, from which record it is presumed that he was born in 1811. He was made a fellow of the Royal College of Physicians in 1844, was president of the college in 1869-71, and became widely known because of his skill in diagnosing and treating mental diseases. He was regius professor of physics in the University of Dublin in 1880-98, when he retired on account of failing eyesight. In 1887 he was president of the British Medical Association. He was an early and persistent advocate of hygiene and fresh-air treatment in mental diseases. He wrote much; but perhaps the most interesting product of his pen was his article entitled, "The Writ de Lunatico Inquirendo in the Case of Jonathan Swift, Dean of St. Patrick's, with Observations" (published in the *Dublin Journal of Medical Science*, in 1868), wherein he proved from legal papers that in August, 1741, Dean Swift had been adjudged, by commissioners, to be "a person of unsound mind and memory and not capable of taking care of his person and fortune."

BANKS AND BANKING. At the opening of the year 1908 there was a feeling of trepidation in banking circles. Money was at a premium in the United States, American bankers were making most strenuous efforts to increase

their cash reserves, and European bankers were enforcing abnormally high discount rates as a means of protecting their gold supplies. The deficit in the reserves against deposits in New York City banks, due mainly to shipments to western banks, was wiped out during the first few weeks of the year, and a surplus of \$40,526,000 in reserves was reported on Feb. 1. The importation of gold late in 1907, an unprecedented supply of currency (q. v.), slackness in retail trade and in industrial and commercial operations, and the return of deposits withdrawn in October and November, 1907, resulted in a piling up of cash in banks all over the country. A somewhat similar condition obtained abroad. Cash reserves in the Reichsbank at Berlin increased more than \$100,000,000 during the year, and the gold in the Bank of France increased by more than \$150,000,000. The effect of such large cash holdings was a low rate for money on call, as well as for loans, at New York, and greatly reduced rates at London, Berlin and Paris. Another effect was a splendid market for investments, with rising prices for securities at all important centres (see *FINANCIAL REVIEW*). Bankers in the United States assisted in the refunding of an enormous amount of bonds and short time notes, and in the flotation of many new issues by well-established corporations, but were cautious about making advances for entirely new developments. English bankers, on the other hand, loaned an unusually large amount of money abroad, while French bankers were calling in funds from all parts of the world, both for economic and political reasons. While a conservative feeling was dominant at the close of the year, the banking position throughout the world was remarkably strong.

The banking power of the United States in 1908 as indicated by the capital, surplus and other profits, deposits and circulation of national banks is shown in the following table from the report of the Comptroller of the Currency:

BANKING POWER OF THE UNITED STATES.

	Number	Capital	Surplus, etc.	Deposits	Circulation	Total
National banks	6,824	\$919,100,850	\$748,701,600	\$4,504,817,232	\$613,663,963	\$6,786,283,645
State, etc., banks	14,522	838,058,353	1,012,811,484	8,409,959,961		10,260,829,798
Non-reporting banks.....	b 3,654	76,646,000	32,957,000	485,988,831		595,591,831
Total	25,000	1,833,805,203	1,794,470,084	13,400,766,024	613,663,963	17,642,705,274

a Includes government deposits.

b Estimated capital, etc., based on reports received from private banks.

This total was about 1 per cent. less than that preceding the panic of 1907, the difference being due to diminished deposits, all other items showing increases.

The Comptroller's report shows that, though aggregate bank resources were one-third of 1 per cent. less in 1908 than in 1907, they were more than double the amount in 1900. The aggregate in June, 1908, was \$19,583,410,000, or 114 per cent. more than in 1900. The average per capita of bank resources for the entire country was \$224, the average for New York being \$637, for Massachusetts, \$486, and for California, \$478, these three States ranking highest. The average was lowest for the Southern States, being only \$65.

Aggregate loans in 1908 were \$10,438,000,000, a decrease of 3 per cent. from the 1907 total.

This decrease was divided among all the geographical divisions. Of the total loans, 40 per cent. were made by banks in the Eastern States, 26 per cent. by those in the Middle Western States, 13 per cent. by those in New England, and 10 per cent. by those in the Southern States. The loans of national banks comprised 45 per cent. of the total, of State banks 23.5 per cent., of savings banks 18 per cent. and of loan and trust companies 12.5 per cent.

The aggregate capital stock of the 21,346 banks reporting in 1908 was \$1,757,159,000, a gain over 1907 of \$66,290,000. Of this total one-third, or \$571,034,000, was credited to banks located in the Eastern States, that is, New York, New Jersey, Pennsylvania, Delaware, and Maryland. The capital of banks in the Middle Western States aggregated 28 per cent. of the

total; in the Southern States, 16 per cent.; in the Pacific States, 8.5 per cent.; in the New England States, 7.8 per cent.; and in the Western States, 6.8 per cent. Banks in island possessions had a total of \$7,939,000 capital. The States possessing the largest amounts of banking capital were: New York, \$260,091,000; Pennsylvania, \$225,855,000; Illinois, \$117,670,000; Ohio, \$102,618,000; California, \$97,353,000, an amount somewhat (\$315,100,000) less were the leading States of their sections in this respect.

The individual deposits in all the reporting banks June 30, 1908, aggregated \$12,784,511,000, an amount somewhat \$315,100,000 less than in June, 1907, but 76 per cent. greater than the aggregate individual deposits of 1900, and 28 per cent. greater than those of 1904. These percentages are striking when it is known that the population had increased but 14.5 per cent. since 1900, and money in circulation but 47.8 per cent. The total deposits were distributed among the various kinds of banks in the following proportions: State, 23 per cent.; savings, 27 per cent.; private, 1 per cent.; loan and trust companies, 14.6 per cent.; national, 34.2 per cent. As compared with 1900, the State banks in 1908 held 5.5 per cent. more of the deposits and savings banks 5.8 per cent. less. By geographical divisions the deposits were distributed as follows. New England, 15.3 per cent.; Eastern, 41.8 per cent.; Southern, 7.1 per cent.; Middle Western, 23.2 per cent.; Western, 4.6 per cent.; Pacific, 6.4 per cent.; and Islands, 1.6 per cent. The decrease from the 1907 total was shared by all the divisions except New England, which showed an increase of \$27,800,000. Of the deposits in the New England States, 63 per cent. were in savings and 20 per cent. in national banks; of those of the Eastern States, national banks and savings banks each held 32 per cent., loan and trust companies, 26 per cent., and State banks 10 per cent.; of those in Southern States, national and State banks each held almost one-half; a very similar division obtained in the Middle Western States; of deposits in the Western States, 55 per cent. were in national and 40 per cent. in State banks; and of deposits in the Pacific States almost 40 per cent. were in State banks, and the remainder divided equally between national and savings banks each. Assuming a population of 87,500,000, there were on deposit an average of \$146 for each inhabitant.

The banking power of the world, according to a summary of the most reliable data obtainable in 1909, aggregated \$45,750,300,000, distributed as follows: United States, \$17,642,700,000; British Empire, \$11,157,000,000; Continental Europe; \$5,472,600,000; Central and South America, \$851,700,000; other foreign (except savings) banks, \$1,328,600,000; foreign savings banks, \$9,297,700,000. The total for the world was almost three times as great as in 1890. While the total for the United States increased 242 per cent. since 1890, that of foreign countries increased 159 per cent.

MORSE CONVICTION. An important event in the banking history of the year was the conviction of Charles W. Morse and Alfred H. Curtis, respectively vice-president and president of the National Bank of North America in New York City. The so-called "high finance" operations of Mr. Morse had figured prominently in the

events preceding the crisis of October, 1907. His forced retirement from banking control and the disentanglement of his connection with various banks was attended by the closing of the above named bank on January 27. He and President Curtis were subsequently tried for misappropriation of the bank's funds and for permitting, knowingly, false entries to be made in the bank's books. The evidence indicated that Mr. Morse was the principal owner and the moving spirit in the doings of the bank, hence President Curtis was released under suspended sentence, while Morse was sentenced on November 6 to fifteen years penal servitude in the Federal prison at Atlanta, Ga. The evidence showed that Mr. Morse had acquired control of nine different banks. His method was to buy a controlling portion of a bank's stock from the proceeds either of notes or of another bank's stock. The new stock could be used as collateral to take up his notes or to assist in the purchase of control in another bank. In any case the extension of banking control increased his opportunities for borrowing on American Ice, Consolidated Steamship and United Copper stocks, all of which Morse was manipulating by spectacular and unsound methods. It was shown that Morse obtained loans from his banks by using office boys and stenographers as dummies. It was shown that Morse largely overdraw his account at the North America Bank; and that he borrowed heavily from it during the very week of the panic when the bank's reserves were already below the legal limit.

GUARANTEE OF DEPOSITS. The subject of the guarantee of bank deposits by public authority was prominently before the public in 1908. It became a political issue because of its advocacy by Wm. J. Bryan and the incorporation of a pledge in its favor in the Democratic platform. Immediately following the financial panic of 1907, Mr. Bryan had strongly advocated the inauguration of a plan of government guarantee for bank deposits as a means of preventing runs on banks and the panics among depositors that are so disastrous at a time of unusual financial disturbance. The timeliness of the proposal, the enactment of a law in Oklahoma providing for such a plan, and the prominence of Mr. Bryan in political leadership, thrust the subject into politics, thus making unbiased discussion difficult. The Oklahoma law, passed December 17, 1907, became effective February 17. This law provided that (1) all banks organized under State law should pay to the State Banking Board, consisting of five State officers, an assessment of 1 per cent. on the average daily deposits for the year preceding February 15; (2) the guarantee fund thus raised shall be kept equal to 1 per cent. of total deposits; (3) all State banks shall be subject to rigorous examination, the Banking Board having power to force the discharge of any official found to be dishonest, reckless, or incompetent; (4) on the suspension or failure of any bank, depositors are to be paid in full at once, any amount necessary to this end not supplied by the bank's cash and quick assets, to be taken from the guarantee fund; (5) banks conforming to the act may advertise that their deposits are guaranteed by the State of Oklahoma; (6) national banks may secure the advantages of the act by conforming to its provisions. As a result of the fifth provision, banks in neighboring States found that

their depositors were sending their money to Oklahoma banks, hence there was a strong demand in Kansas and Missouri for similar statutes. Fifty-seven national banks in Oklahoma sought to avail themselves of the advantages noted under (6) above. The Attorney General of the United States informed them that such action was unwarranted. Thereupon a large proportion of them went into voluntary liquidation and reorganization as State banks. The guarantee fund raised under the new law in 1908 was \$150,000, of which \$111,000 was invested in State warrants drawing 6 per cent. interest and redeemable upon presentation. The remainder was placed in State banks.

The most common arguments in favor of the plan were that, the depositor being insured against loss, runs on banks would be stopped; that this plan would bring into the banking business even a better class of men on the average than at present by increasing the interest of each bank in the integrity of all others; that the strengthening of confidence and the avoidance of collapse would be worth to bankers and to business and industry many times the cost; that the plan was in line with the tendency toward increased regulation of capitalistic institutions; and that it harmonized with the tendency of economic life to scatter among many the losses incident to unexpected and unpreventable turns of fortune, as shown in the growth of many kinds of insurance.

At its annual meeting at Denver in October, the American Bankers' Association's Committee on Federal Legislation reported unfavorably to the plan. It said, "If a bank's investments are good, . . . the depositors are amply protected and need no other guarantee. . . . We should discourage unwise extension of credit rather than open the way for reckless banking, which would seem to be the inevitable result of the proposed scheme." In line with this objection it was argued that such a guarantee would tend to check the elimination of unsafe bankers, because the latter would be able to assure depositors that deposits were guaranteed, thus rendering customers less careful in the bestowal of patronage. Moreover such bankers would by this scheme be encouraged to take unusual risks, with the result that the conservative banker would in fact be taxed for the benefit of his less scrupulous rival. It was further contended that a guarantee of deposits would not prevent runs on banks, for such panics are due as much to the desire to get money at once as to get it at all. The guarantee fund would be invested in securities, which would require some time for conversion. That this point is of importance is shown by the extensive runs on savings banks in October, 1907. Bills for the introduction of a plan of State guarantee of bank deposits were presented in the legislatures of New York, New Jersey, Nebraska and Indiana in 1908.

See NATIONAL BANKS; PRIVATE BANKS; SAVINGS BANKS; LOAN AND TRUST COMPANIES; and FINANCIAL REVIEW.

BAPTISTS. A religious denomination which took its name in 1644 from the designation applied to certain congregations of English Separatists, by whom the ancient practice of immersion had been recently restored. In the United States the church was founded by Roger Williams, who established the first congregation

at Providence, R. I., about the middle of the 17th century. There are fourteen divisions of Baptists in the United States, but the so-called "Regular Baptists," North, South, and Colored, differ only in organization, having no doctrinal distinctions. The American Baptist Year Book for 1908 gives to these bodies a total membership of 4,969,524 in 1908. These make up the greater number of communicants of the Baptist churches. All the bodies bearing the name Baptists numbered in 1908, 5,224,305 communicants, ranking third among the religious families of the United States. The designation and number of communicants of the various bodies are as follows: Regular North, 1,155,442; Regular South, 1,981,749; Regular Colored, 1,778,824; Six Principle, 858; Seventh Day, 8,509; Free-Will, 82,303; Original Free-Will, 12,000; General, 29,347; Separate, 6,479; United, 13,209; Baptist Church of Christ, 8,254; Primitive, 126,000; Old-Two-Seed-in-the-Spirit Predestinarian, 12,851; Church of God and Saints of Christ, 8,500.

In the Regular Baptist denomination, there were in 1908, 47,409 churches, 34,038 ordained ministers; in the Sunday schools were 2,241,606 scholars, with 23,103 officers and teachers. The value of the church property was \$121,870,340. The total contributions for all sources during the year was \$22,268,892, divided as follows: Church expenses, \$16,400,949; Sunday school expenses, \$765,708; State missions, \$694,338; home missions, \$664,064; foreign missions, \$820,499; Bible and publication work, \$96,113; education, \$366,323; miscellaneous, \$1,946,182. The foreign missions of the church are carried on in Burmah, Assam, South India, Siam, China, Japan, Africa, Philippine Islands, and Europe. The denomination sustains in foreign countries 1,294 churches and 324 ordained preachers. In these churches are 137,438 members. Home missions are carried on throughout the United States. The missions of the Church are under the conduct of the American Baptist Missionary Union and the American Baptist Home Missionary Society. The Southern Baptist Union, which is the organization of the Southern Baptists, maintains missions in Argentina, Brazil, Mexico, Italy, Africa, China, and Japan. The denomination has organized bodies in each of the States in the Union for the carrying on of missionary, educational and other work. Among other organizations of the church, whose titles sufficiently designate their purpose, are the American Baptist Historical Society; the Woman's Baptist Foreign Missionary Society; the American Baptist Educational Society, and the Baptist Young People's Union of America. Home work is carried on in many forms, although the special organization is the German Baptist Conference. The Swedish Baptist Conference has charge of the work among the Swedes in the Northwest.

The most notable event in the history of the Baptist church in many years was the meeting of the Northern Baptist Convention, held at Oklahoma City, beginning May 20, 1908. This body was organized in May, 1907, as the culmination of a movement which was designed to strengthen denominational unity and efficiency among Baptists throughout the North. At that time a constitution was provisionally adopted, and this was referred to the churches for ratification. This constitution was formally

adopted at the convention. Over 1,000 delegates attended this convention. Professor Harry Pratt Judson, of the University of Chicago, was elected president. The purpose of the convention was to organize in some organic way all the self-perpetuating and more or less independent societies through which the missionary activities of the church have hitherto been carried on and to affiliate this body with the convention. A joint committee of the convention and the societies was appointed to report the particular form which this convention is to take at the meeting in 1909. By a provisional arrangement it was made possible for many of the organizations of the church to become "co-operating societies" by agreeing to regulate expenditures, solicit funds, and incur indebtedness only on the approval of the convention. The convention, on its part, agreed to aid through its executive committee in raising funds needed by each co-operative society.

The purposes of the convention are expressed in the following resolution, which was unanimously adopted: That at the earliest practicable date there should be organic union between the various general denominational societies and the Northern Baptist Convention to the end that the denomination through its convention may be able to determine a suitable related policy for all its general activities, may establish a single co-ordinated budget for the same, and may provide adequate funds required by this budget; and to the further end that it may be possible to put the various agencies out of debt and thereafter to keep them out of debt. A Finance Committee of nine members was appointed. The Executive Committee should nominate a list of not less than three times the number to be appointed. This body is to have charge of the financial affairs of the societies of the church. The three great societies of the denomination, the Missionary Union, the Home Missionary Society, and the Publication Society, took immediate steps to become co-operating societies. Their budgets were passed upon by the executive committee of the convention and thus for the first time there came before the denomination a unified budget. To this budget there was added the amounts of the debts of the society. The convention sent out a plea to the Baptists of the North for \$1,500,000 for the missionary work of the denomination at home and abroad. Commissions were appointed to study and report on the work carried on by the churches along lines of social service and city missions. This Commission is to issue a series of pamphlets upon social aspects of the work of the church. Commissions were also appointed upon the affiliation of Baptist organizations for the relief of dependent ministers and widows and upon the denominational press.

The 63rd anniversary of the Southern Baptist Convention was held at Hot Springs, Ark., commencing May 14, 1908. The first European Baptist Church Congress was held in Berlin in September, 1908.

BAPTISTS, FREE, sometimes called **FREE WILL BAPTISTS**. A religious denomination which corresponds in doctrine and practice to the General Baptists of England, but which was founded in 1780 by Benjamin Randall, who established a church in New Durham, N. H., after he had left the regular Baptist Church

because of his disbelief in the doctrine of election. The Free Baptists are strongest in New England, but have considerable strength in the West. In 1908, the membership was approximately 75,000 with 1,500 churches and 1,250 ministers. During the year \$50,000 was raised for foreign and home missions and for educational work. The General Conference met in Cleveland, O., October 1-7, 1907. A committee appointed in 1904 to confer with other Christian denominations respecting doctrinal and other grounds of union reported at this conference. As a result of the action of this conference, further sessions have been held with the Baptists, and the plan of union for the missionary work of the two denominations has been agreed on by nearly all of the State Associations made necessary by the action of the General Conference.

The Free Baptists maintain several colleges: Bates College, at Lewiston, Me.; Rio Grande College, at Rio Grande, O.; Storer's College, at Harper's Ferry, W. Va.; Parker College, at Winnebago, Minn., and Hillsdale College, at Hillsdale, Mich. A Theological Seminary is maintained in connection with this institution, and Keuka College, at Keuka Park, N. Y., is maintained in connection with the Disciples. The *Morning Star*, edited by George F. Mosher, LL.D., is published at Boston, Mass. Rev. H. M. Ford, D.D., Hillsdale, Mich., is the Corresponding Secretary of the General Conference.

BAPTIST YOUNG PEOPLE'S UNION OF AMERICA. A union of all the young people's societies in Baptist churches for the purpose of carrying on educational work, designed to train young people for efficiency in Christian work, organized in Chicago in 1891. The headquarters of the organization are in Chicago. Its official organs are two monthly magazines, *Service* for the senior department, and *Our Junior* for the junior department. These two organs are now published by the American Baptist Publication Society in Philadelphia. In 1908 there were 600,000 members of the organization. It is international in its scope, including all the provinces of Canada as well as the States of the Union. Rev. Geo. T. Webb is General Secretary.

BAR ASSOCIATION, AMERICAN, was organized in 1878 as an association of the leading lawyers of the United States who meet annually for the purpose of discussing matters of interest to the profession. The object, as stated in the constitution, is to advance the science of jurisprudence, promote the administration of justice and uniformity of legislation throughout the union, uphold the honor of the profession of the law and encourage cordial intercourse among the members of the American Bar. Membership, about 3,500. Attendance at meetings, 300 to 400. The thirty-first annual meeting was held at Seattle, Wash., August 25, 26, 27, and 28, 1908. The president, Jacob M. Dickinson of Chicago, delivered the president's address, including a summary of noteworthy changes in statute law during the year. The annual address was delivered by George Turner of Spokane, Wash., on "The Acquisition of the Pacific Northwest." Papers were read by Judge C. H. Hanford of Seattle on "National Profession and the Increasing Responsibilities of Our National Judiciary;" by Frederick Baus-

man of Seattle on "Are Our Laws Responsible for the Increase of Violent Crime?" and by Edgar H. Farrar of New Orleans on "Extension of Admiralty Jurisprudence by Judicial Interpretation." The Committee on Code of Professional Ethics reported a Code of Ethics which was finally adopted. The Committee to Suggest Remedies and Formulate Proposed Laws to Prevent Delay and Unnecessary Cost in Litigation presented a report with several proposed statutes. Other important committee reports were presented by the Committees on Commercial Law, International Law, Insurance Law, Uniform State Laws, and Patent Law, the latter relating to the establishment of a Court of Patent Appeals. In connection with the meeting of the American Bar Association, there were meetings of the Section of Legal Education, Section of Patent, Trade-Mark and Copyright Law, the Comparative Law Bureau, the Association of American Law Schools, and the Conference of Commissioners on Uniform State Laws, proceedings of all of which are embraced in the American Bar Association reports. The officers elected for 1908-1909 are as follows: President, Frederick W. Lehmann, St. Louis, Mo.; Secretary, John Hinkley, 215 N. Charles St., Baltimore, Md.; Treasurer, Frederick E. Wadhams, Tweddle Bldg., Albany, N. Y.

BARBADOS. The most easterly of the West Indian Islands, a British possession. Area, 166 square miles. Population (1907), estimated at 194,518. Bridgetown, the capital, has about 30,000 inhabitants. About 100,000 acres are in cultivation. The principal products are cotton (947,140 pounds in 1907), sugar, molasses, tobacco, coffee, indigo, and arrowroot. Sugar-cane covers 35,000, and cotton 7,000 acres (16 acres in 1903). Manjak, a variety of bitumen used for fuel, is obtained. Oil indications cover an area of 25 square miles, and the oil strata are supposed to be coextensive with the island. The imports and exports in the calendar year 1907 amounted to \$6,188,112 and \$4,551,578 respectively, against \$5,802,663 and \$4,540,434 in 1906. The principal imports in 1907 were: Live animals, foods, drinks, and narcotics, \$2,453,754; textiles, \$1,175,285; coal and coke, \$444,808; manures and fertilizers, \$292,311. The principal exports in 1907 were: Sugar, \$1,267,333; molasses, \$1,133,543; cotton, \$405,695; manjak, \$33,726. The trade with the principal

countries of origin and destination in 1907 was as follows:

From and to	Imports	Exports
Great Britain	\$2,716,320	\$ 885,640
Canada	496,122	1,552,428
British West Indies....	283,419	656,474
British Guiana	223,876	85,410
United States	2,242,194	349,129

During the fiscal year 1907-8 the imports were valued at £1,271,530 (£558,148 from Great Britain) and the exports, £935,256 (£181,981 to Great Britain). By a convention between Great Britain and France in March, 1908, the "colonial products" of Barbados are admitted into France and its colonies at the lowest rates of duty applicable to similar products of other foreign origin; and similarly the products and manufactures of France and its colonies into Barbados. The convention is to remain in force until one year after denunciation by either contracting party. The tonnage entered and cleared in 1907 was 1,736,363 (1,573,810 British). There are 28 miles of railway owned by a company. The revenue in 1907-8 was £209,818; the expenditure, £188,296; and the public debt, £404,900. The Governor in 1908 was Sir Gilbert Thomas Carter.

BARBIER DE MEYNARD, CHARLES ADRIEN CASIMIR. A French Orientalist, died on March 31, 1908. He was born at Marseilles in 1827. After serving in the French legation to Persia he became professor of Turkish in the School of Living Oriental Languages at Paris. He was elected professor of Persian at the Collège de France in 1875, and of Arabic (*ibid.*) in 1885. At the time of his death he was director of the School of Living Oriental Languages. His publications include: *Geographical, Historical and Literary Dictionary of Persia and Adjacent Countries* (1861); and *Turkish-French Dictionary* (1885-87).

BARLEY. The total production of barley in 1908 amounted to 166,756,000 bushels. This crop was secured on 6,646,000 acres, the average yield per acre being 25.1 bushels, and the total value of the crop based on the average price, 55.4 cents per bu. on Dec. 1, as shown by agricultural statistics, reached \$92,442,000. The year 1908 held the record for acreage, 1907 for total farm value with \$102,290,000, and 1906 for production with 178,916,000 bushels. The acreage, yield, etc., of the principal barley-producing States taken from statistics published by the Department of Agriculture are given in the following table:

States	Acreage	Yield per acre	Production	Price per Bu. Dec. 1	Total Value Dec. 1
	Acres	Bus.	Bus.	Cents	Dollars
Minnesota	1,300,000	25.0	32,500,000	49	15,925,000
California	1,082,000	23.5	25,427,000	74	18,816,000
Wisconsin	825,000	30.0	24,750,000	58	14,355,000
South Dakota	928,000	26.5	24,592,000	47	11,558,000
North Dakota	940,000	19.5	18,330,000	46	8,432,000
Iowa	500,000	37.0	13,500,000	51	6,885,000
Totals	5,575,000		139,099,000		75,971,000

These six States contained about 83% of the total acreage and produced about the same percentage of the total crop. The highest average yields for the year among the States and Territories are recorded for Utah, New Mexico, Idaho, Arizona, Montana, and Wyoming, the quantities being 45, 42, 41, 38, 35, and

35 bushels per acre respectively. The barley crop of the world for 1907 was 1,267,814,000 bushels, of which North America produced 205,832,000 bu., Europe 911,451,000 bu., Asia 102,939,000 bu., Africa 44,205,000 bu., and Australasia 3,387,000 bu. In Europe the principal barley-producing countries and their yields in

1907 were as follows: Russia (European) 344,104,000 bu., Germany 160,650,000 bu., United Kingdom 69,258,000 bu., and Spain 53,598,000 bu. In 1908 the annual barley and hop exposition held in Berlin in October assumed an international character which resulted in a marked increase in the number of entries. The barley samples exhibited numbered 750 as against 240 in 1907. Much interest was shown in the comparison of the samples from the different countries with reference to their qualities for brewing purposes. The exhibition did not include barley samples from the United States. European plant breeders interested in the improvement of barley pointed out that selection to increase the productivity of the crop also improves its quality within certain limits; that a high starch content and a low protein content have a marked influence on the yield; and that the uniformity in size, shape, and quality of the kernel, so important to a good brewing barley, can be secured and maintained by keeping the varieties pure and by pedigree breeding. A good barley for brewing purposes was described as consisting of medium-sized kernels, well-filled, having fine husks, a high degree of mealiness, and a thin gluten layer. Long, loose, strongly nodding heads and a thin, fine stem are considered as correlated with good brewing quality. Among the results secured at experiment stations in the United States may be mentioned that hull-less barley grown experimentally under semi-arid conditions and under dry-farming methods has given on an average about 21 bu. per acre. At the Wyoming station three irrigations supplying 19.56 inches of water proved most satisfactory in barley growing. The cost of irrigating, harvesting, threshing, and hauling this particular crop amounted to \$12.27 per acre. In Alaska, Lapland and Mansbury barley among several varieties give promising results. In parts of the Mississippi valley the practice of sowing hull-less barley as a nurse crop for alfalfa is coming into use.

BARYTES. See MINERAL PRODUCTION.

BASEBALL. The professional baseball season of 1908 was the most successful financially of any in the history of the game. This was in large measure due to the closeness of the pennant race both in the National and the American Leagues. In the former organization the three leading teams were separated by only seven points at the close of the season, and in the latter the margin of difference between the first and third teams was but nine points. In the National League Chicago won the pennant for the third consecutive time with 99 games won and 55 games lost. New York and Pittsburg were tied for second place, each club having won 98 and lost 56 games. New York would have won the pennant had not Merkle failed to touch second base after his hit with two out had brought in the winning run in the Chicago-New York game played at the Polo Grounds on Sept. 23. The National Commission directed that this game should be played over at New York on October 8, Chicago winning by the score of 4 to 2. The standing of the other

clubs in the National League at the close of the season in point of games won and lost was as follows: Philadelphia won 83 and lost 71; Cincinnati won 73 and lost 81; Boston won 63 and lost 91; Brooklyn won 53 and lost 101; St. Louis won 49 and lost 105. Detroit again carried off the championship in the American League, winning 90 games and losing 63. Cleveland was second with 90 games won and 64 lost, and Chicago was third with 88 games won and 64 lost. The remaining teams in the American League finished as follows: St. Louis won 83 games and lost 69; Boston won 75 games and lost 79; Philadelphia won 68 games and lost 85; Washington won 67 games and lost 85; New York won 51 games and lost 103. As in the year 1907, the Chicago Nationals and the Detroit Americans were the contenders in the World's Championship series, in which Chicago won four of the five games played. The score follows: Chicago 10, Detroit 6; Chicago 6, Detroit 1; Detroit 8, Chicago 3; Chicago 3, Detroit 0; Chicago 2, Detroit 0. Both the attendance and the receipts of the Championship series showed a decided falling off in comparison with the previous year, for which fact the marked superiority of the Chicago team was doubtless largely responsible. The total attendance at all games of the two major leagues was 7,069,122, an increase of more than 900,000 over 1907. The American League games drew 3,554,837 people and the National 3,514,285. The champion batsman of the National League was Wagner of Pittsburg, who made 201 hits out of 568 times at bat. Criss, of St. Louis, the leading batsman of the American League, made 28 hits out of 82 times at bat. The real leader in the American League, however, was Cobb, of Detroit, who played in 86 more games than Criss, and made 188 hits out of 581 times at bat. Reulbach, of Chicago, was the most successful pitcher in the National League, winning 24 games and losing 7. The best pitching record in the American League was that of Walsh, of Chicago, who won 40 games and lost 15. The pennant winners in the more important minor leagues in 1908 were: American Association, Indianapolis; Eastern League, Baltimore; Southern League, Nashville; Western League, Sioux City; Tri-State League, Williamsport. An important change in the scoring rules was made in 1908 by crediting a batsman with a sacrifice hit on a fly to the outfield, which scores a runner from third base. The champion college baseball team was Princeton, which won the series with Harvard, Yale, Cornell, and Pennsylvania. The scores in Princeton's most important games were: Princeton 3, Harvard 0; Princeton 4, Harvard 0; Princeton 3, Yale 2; Princeton 2, Yale 8; Princeton 4, Yale 2; Princeton 8, Pennsylvania 6; Princeton 3, Pennsylvania 1; Princeton 5, Cornell 4; Princeton 2, Virginia 6; Princeton 1, Virginia 0; Princeton 2, Virginia 0; Princeton 10, Georgetown 3; Princeton 5, Amherst 7. Harvard's principal games were: Harvard 5, Yale 1; Harvard 9, Yale 5; Harvard 0, Yale 3; Harvard 0, Princeton 3; Harvard 0, Princeton 4; Harvard 1, Cornell 0; Harvard 4, Brown 0; Harvard 1, Brown 3; Harvard 4, Holy Cross 3; Harvard 4, Dartmouth 6; Harvard 9, Dartmouth 1; Harvard 2,

Georgetown 2. Yale, in addition to losing both the Princeton and the Harvard series, was defeated by Fordham 1 to 4; Pennsylvania 2 to 3; Dartmouth 2 to 3; Holy Cross 0 to 1. Yale defeated Manhattan 3 to 2; Columbia 7 to 4; Army 6 to 2; Georgetown 4 to 2; Brown 2 to 1, and 9 to 0; Pennsylvania 3 to 1; Amherst 3 to 1. Pennsylvania defeated Amherst 2 to 1; Lafayette 5 to 4; Georgetown 5 to 3; Virginia 6 to 3; Yale 3 to 2; Columbia 5 to 4; Cornell 11 to 5 and 9 to 4; Brown 4 to 1; Holy Cross 4 to 2. Pennsylvania was defeated by Carlisle 2 to 6; Georgetown 2 to 5; Virginia 5 to 7; Navy 0 to 2; Princeton 6 to 8; Yale 1 to 3; Columbia 1 to 4; Dartmouth 3 to 4. Fordham lost only one game during the season, that with Holy Cross. Among the Western colleges the best records were made by Illinois, Minnesota, Wisconsin, and Chicago. The leading Southern colleges were Georgetown, Virginia, West Virginia, and Georgia.

BASKETBALL. The Intercollegiate Basketball Association championship for 1908 was won by the University of Pennsylvania. The standing of the teams at the close of the season was as follows: Pennsylvania won 8 games and lost 0; Columbia and Yale won 5 each and lost 3; Cornell and Princeton won 1 each and lost 7. In the Western Collegiate League, Chicago and Wisconsin won 7 games each and lost 1; Illinois won 4 and lost 4; Minnesota won 2 and lost 6; Purdue won 0 and lost 8. The tie for the championship between Chicago and Wisconsin was played off, Chicago winning by the score of 18 to 16. Chicago and Pennsylvania then played two games for the National Collegiate championship, both of which Chicago won. The New England championship was won by Williams.

BASUTOLAND. A British inland protectorate in South Africa. Area, 10,293 square miles; population (1907), estimated at 351,000. Maseru, the capital and largest town, has 1,300 inhabitants. In 1904 there were 895 whites (200 in Maseru). The climate is excellent, water is abundant, and the country is admirably adapted for the growth of cereals. The protectorate is included in the South African Customs Union (see **BRITISH SOUTH AFRICA**.) In 1907 the imports amounted to £238,600, and the exports to £248,500. The imports are chiefly blankets, hardware, plows, and groceries; the exports cattle, horses, grain, and wool. A railway of 16 miles connects Maseru with the the Bloemfontein-Modderpoort line. The revenue in 1907-08 was £116,529; the expenditure, £126,603. The revenue enue in 1907-08 was £116,529; the expenditure, £126,603. The revenue is derived mainly from the hut tax, post office, licenses, and customs. The Resident-Commissioner—in 1908, H. C.

Soley—is under the direction of the High Commissioner for South Africa.

BATCHELLER, GEORGE SHERMAN. An American jurist and diplomat, judge of the International Tribunal at Cairo, Egypt, died at Paris on July 2, 1908. He was born at Batchellerville, N. Y., on July 25, 1836, graduated at Harvard in 1856, and two years later was admitted to the bar. In 1859 he was elected to the New York State Assembly, in which body he also served in 1873, 1874, 1886, and 1887. He joined the Union army in 1862 as major of the One Hundred and Fifteenth New York Regiment, of which he later became lieutenant-colonel. During his first year of service he was taken prisoner at Harper's Ferry, but was exchanged the following year and after a short service with the Tenth Army Corps was made deputy provost marshal-general of the Department of the South. After the war, as inspector-general of New York, he reorganized the National Guard and was also in charge of the defense of the frontier of the State against the Fenians. In 1875 President Grant appointed him judge of the International Tribunal at Cairo, Egypt, of which body he became president. After ten years service in this court, he resigned, and in 1899 was appointed first assistant secretary of the treasury. In 1891 he became minister to Portugal and two years afterward was sent to Paris as American diplomatic representative to Europe. He was president of the Universal Postal Congress held at Washington in 1895, and in 1898, at the special request of the Egyptian government, was again appointed to the International Tribunal. He was promoted to the Supreme Court of Appeals in 1902.

BATES, JOSHUA H. A veteran of the Seminole war, died at Cincinnati, Ohio, July 26, 1908. He was born in Boston, March 5, 1817, and graduated from West Point in 1833. He served in Florida for a time and was present at the battle of Loca-Hatchee on Jan. 24, 1838. He resigned from the army in 1842 and began to practice law in Cincinnati. As a brigadier-general of Ohio militia he was prominent in organizing the State forces at the beginning of the Civil War. He also took part in the defense of Cincinnati in 1862. He served two terms in the Ohio Senate, 1864-66 and 1878-80.

BATTLESHIPS. All the great naval powers, except France, were building "Dreadnoughts," although no battleship of this type had been completed outside of England up to the end of the year. The *Dreadnought* of 1906 did not mark a revolution, but a reversion. Battleship development can best be seen by reference to English construction, as shown in the following table:

Name.	Completed	Displacement (Tons)	Battery.
Devastation	1873	9,330	4-12", 35 ton M.L.R.
Dreadnought	1875	10,820	4-12.5", 38 ton M.L.R.
Inflexible	1881	11,880	4-16", 80 ton M.L.R.
Royal Sovereign	1892	14,150	4-13.5" B. L. R., & 10-6" B. L. R.
Majestic	1895	14,900	4-12", 12-6"
King Edward	1905	16,350	4-12", 4-9.2", 10-6"
Dreadnought	1906	17,900	10-12"
Lord Nelson	1908	16,500	4-12", 10-9.2"

LAUNCH OF THE UNITED STATES BATTLESHIP, "SOUTH CAROLINA"

The all-big-gun idea goes back to the *Devastation*, designed in 1869, which, besides her four 12-inch muzzle-loading rifles, carried only Hotchkiss 3-pounders and 6-pounders, and machine guns. From 1893 to 1901, the batteries of battleships remained the same, four 12-inch, and twelve 6-inch guns, although improvements in ordnance made the later guns more powerful than those of the *Majestic*. The eight *King Edwards*, estimates of 1901-2, embodied improvements in the manufacture and distribution of armor. The 6-inch gun with its 100-pound shell had become ineffective even against 6 inches of Krupp armor at 3000 yards. The 9.2-inch gun fires a 380-pound shell. The three calibre battery of the *King Edward* class resulted in confusion in fire control, as the spotters were unable to distinguish the splashes of the different sizes of shells; and also in complicated stowage of ammunition. Better armor, and the fact that future battles will be fought at long range, tended to make the 6-inch gun obsolete, except for torpedo defence, for which it has, so far, been considered too large. But it was fire control that was largely responsible for the all-big-gun ship. The *Bellerophon*, *Temeraire*, and *Superb* 18,600 tons, were appropriated for in 1906-7; the *St. Vincent*, *Collingwood*, and *Vanguard*, 19,250 tons, in 1907-8; the main battery was the same as that of the *Dreadnought*. The torpedo defence battery has been improved from twenty-seven 12-pounders in the *Dreadnought* to twenty 4-inch 25-pounder guns in the later battleships. Cost increased with tonnage. Two *Royal Sovereigns* were built for the cost of one *Dreadnought*; and four *King Edwards* for the cost of three *Dreadnoughts*.

The United States was the first great naval power to follow the lead of England, with the *Michigan* and *South Carolina*. The main battery of each consists of eight 12-inch guns in pairs in turrets on the centre line. Turret No. 2 fires over turret No. 1; No. 3, over No. 4. On Dec. 31st, 1908, the *Michigan* was 85.1 per cent. completed; the *South Carolina*, 75.1 per cent. The *Delaware* and *North Carolina* were appropriated for in 1907; the *Utah* and *Florida*, in 1908. These four ships are of 20,000 tons, each carrying ten 12-inch guns in pairs, in turrets on the centre line. The four later ships are better protected than the *Michigan* and *South Carolina*. They also have a better torpedo defence battery fourteen 5-inch 70-pounders against the twenty-two 14-pounders of the *Michigan* and *South Carolina*. The fire control stations are on two separate latticed steel towers. On Dec. 31st, 1908, the *Delaware* was 59 per cent. completed; and the *North Dakota*, 67.4 per cent. The *Florida* and *Utah* were but just commenced.

Although Germany in 1908 was building "Dreadnoughts," discussion was very active as to the wisdom of the step. The same arguments that had been heard in England and the United States for the three years previous, for and against, were being used in Germany. Since Mar. 1907, Germany had laid down seven battleships and three armored cruisers of the largest and most powerful types. The German programme, as amended, provided for laying down, in each of the years 1909-11, three battleships and one armored cruiser. The battleships *Nassau*, launched Mar. 7th, 1908, and *Westphalen*, launched July 1st, 1908, carry

twelve 11-inch guns each; speed, with reciprocating engines, 19 knots; 20,000 H.P. The 11-inch gun fires a 760 lb. shell; the British 12-inch gun, an 850-lb. shell; but its muzzle velocity is 3250 ft. sec., to the British gun's 2900 ft. sec. The secondary armament (also for torpedo defense) consists of twelve 6.7-inch guns (132-lb. shell), capable of penetrating 5 inches of Krupp armor at 5,000 yards. Great secrecy was being maintained about all the new German ships; but it was believed that the *Rheinland* and *Ersatz Baden* of the 1907 programme would displace 17,960 tons; speed, 20 knots; H.P., 22,000; and that the *Ersatz Oldenburg*, *Ersatz Beowulf*, and *Ersatz Siegfried* of the 1908 programme would also be of 17,960 tons, but would carry 12-inch instead of 11-inch guns.

Before 1905, all Japanese armored ships were designed and built abroad. The *Satsuma*, launched in 1906, and the *Aki*, launched in 1907, had not been completed in 1908. The *Satsuma*, 19,350 tons, has reciprocating engines of 17,500 H.P.; speed, 20 knots; the *Aki*, 19,800 tons, has Curtis turbines, 22,000 H.P.; speed, 20.5 knots. It was announced in November, 1908, that the armament of each would be ten 12-inch, 50 calibre, and 24 rapid fire guns, probably ten 6-inch and fourteen 4.7-inch guns. Two all-big-gun battleships were being built at Kure and Yokosuka, of 20,800 tons, but details about them were kept secret.

Brazil had three "Dreadnoughts" of 19,500 tons under construction in England, the *Minas Geraes*, *São Paulo*, and the *Rio de Janeiro*. The battery of each consists of twelve 12-inch guns (10 on the broadside), and twenty-two 4.7-inch; the main armor belt is only 9 inches thick.

France was the only great naval power in 1908 not building "Dreadnoughts." For the *Danton*, *Mirabeau*, *Diderot*, *Condorcet*, *Voltaire*, and *Vergniaud*, the Superior Council decided, in 1906, in favor of four 12-inch and twelve 9.4-inch guns; that is, a copy of the *Lord Nelson*, with two 9.4-inch guns added; displacement, 18,400 tons; speed (Parson's turbines), 19.25 knots.

CRUISER BATTLESHIPS. The cruiser battleships are really battleships of great speed, capable, not only of taking their place in the line of battle, but also of scouting, and of attacking and defending commerce. Armor protection has to be sacrificed somewhat to obtain high speed, and great fuel capacity. Here England again led the way. In fact, while the *Invincibles* were building, the world was misled by their designation as armored cruisers. The *Invincible* class (*Invincible*, *Inflexible*, and *Indomitable*, 17,250 tons), launched 1907, carry eight 12-inch guns; with sixteen 4-inch guns for torpedo defense; 41,000 H.P. (Parson's turbines); speed, 27 knots on trial trip, 25 knots being designed; main armor belt, 7-inch Krupp armor; average cost, £1,725,000. Germany followed England's lead in 1907 with "F" of 18,700 tons; speed, 25 knots; turbine engines of 45,000 H.P.; twelve 11-inch guns, with 24-pounders for torpedo defense; 8-inch armor belt, 6 inches at bow, and 4 inches at stern. Another, "G," was building in 1908.

BAUXITE. See MINERAL PRODUCTION.

BECHUANALAND. A British protectorate in South Africa. Area, about 275,000 square miles. Population, (1907), about 133,100, including over 1,000 whites. Serowe, the chief town of the Bamangwato tribe, has 17,000

inhabitants. The natives are cattle-rearing and agricultural. The exports are mostly animals, skins, horns, etc. The protectorate is included in the Customs Union of British South Africa (q. v.). It is crossed by the railway and telegraph line from Cape Colony to Rhodesia. The administration is by a Resident Commissioner—in 1908, Lieut.-Col. F. W. Panzera—who resides at Mafeking, Cape Colony, and is under the supervision of the High Commissioner for South Africa. The natives are under the immediate rule of the tribal chiefs. Civil suits between natives are tried by native chiefs, with an appeal to magistrates' courts, where suits between natives and whites are tried. In 1907-8 the revenue was £31,563; the expenditure, £75,851. The deficit was covered by an Imperial grant-in-aid.

BEQUEREL, ANTOINE HENRI. A distinguished French physicist, discoverer of the "Becquerel rays," died on Aug. 25, 1908. He was born in Paris on Dec. 15, 1852, a son of Alexandre Edmond Becquerel (1820-91), who made important researches in phosphorescence; and a grandson of Antoine César Becquerel (1788-1878), an able investigator of electrical and electrochemical phenomena. He studied at the Lycée, Louis le Grand, and at the École Polytechnique and in 1875 became a government engineer of bridges and roads. As early as 1875 and 1876 he had published important papers on magnetic rotary polarization, and in 1879-83 he prepared, with his father, a series of discussions of the temperatures of the surface of the earth, and to a depth of 30 metres below the surface. In his investigation of the subject of phosphorescence he became especially interested in the phenomenon (discovered by Goethe) of the fading of the light of a phosphorescent body when exposed to the red rays at the hot end of the spectrum. In 1886-90 he experimented on the absorption of light in crystals. In 1892 he became a professor in the Musée d'Histoire Naturelle, in 1894 engineer-in-chief of bridges and roads, and in 1895 he was appointed professor in the École Polytechnique.

Becquerel published in the *Comptes rendus* of Feb. 24, 1896, the first of his experiments which resulted in the discovery of the so-called Becquerel rays and the establishment of the new and highly important branch of physico-radio-activity. In this experiment he had discovered the radio-active power of uranium. His subsequent experiments, which developed and completed this discovery, were published on March 2 and March 23, and he continued these investigations, which are described at length and lucidly in his work, *Recherches sur une Propriété nouvelle de la Matière* (1903). In recognition of the great importance of his discovery, the Royal Society awarded him the Rumford medal in 1900. He also received—with the Curies—the Nobel prize in 1903, and in 1907 the Helmholtz medal from the Berlin academy, and the Burnard medal from the National Academy of Sciences. He was president of the Société Française de Physique in 1907; in 1907 was elected vice-president of the French Academy, and in June, 1908, was chosen perpetual secretary of the Academy, in the place of Albert Auguste de Lapparent (q. v.). Consult the

obituary sketch in *Nature* (Sept. 3, 1908, p. 414 sqq.) and Burke, "Some Scientific Centres" (*id.*, Dec. 22, 1905, vol. LXXI, p. 177), which gives an account of the laboratory of the Musée d'Histoire Naturelle, and describes the apparatus used by Becquerel.

BEEVOR, CHARLES EDWARD. An English physician, died on Dec. 5, 1908. He was born in London in 1854, was educated at the University College there, and became a practising physician in 1881. He became a Fellow of the Royal College of Physicians in 1888, Croonian lecturer in that institution in 1903, Lettsomian lecturer to the Medical Society of London in 1907, and president of the Neurological Society in 1907. Shortly before his death he published in the *Philosophical Transactions* of the Royal Society an elaborate consideration of the arterial system of the brain, with fine color-photograph illustrations. In his Lettsomian lectures he discussed the diagnosis and localization of inter-cranial tumors. At the time of his death he was making a careful investigation of the action of paralyzed muscles. Dr. Beevor was especially invited to address the meeting of the American Medical Association in the summer of 1908.

BELGIUM. A country of western Europe. Area, 11,373 square miles. Population (1900), 6,693,548; on Dec. 31, 1907, it was estimated at 7,317,561. In 1900 French was the exclusive language of 2,574,805 people, Flemish of 2,822,005, and German of 28,314; while 801,587 spoke French and Flemish, 66,447 French and German, 7,238 Flemish and German, and 42,889 all three languages. In 1906 there were 58,388 marriages, 194,775 births, 127,388 deaths, and 8,504 still-births. The excess of births was thus 67,387, against 69,094 in 1905. Immigrants in 1906 numbered 37,382; emigrants, 32,858. The largest cities, with their populations as estimated on Dec. 31, 1907, are: Brussels, the capital, 198,449, exclusive of suburbs; Antwerp, 310,903; Liege, 173,939; Ghent, 164,117; Malines, 59,107; Bruges, 53,781; Verviers, 48,756; Borgerhout, 46,441; Ostend, 42,419; Louvain, 42,219; Seraing, 41,208. The following are the larger suburbs of Brussels: Schaerbeek, 75,153; Ixelles, 73,064; Mollenbeck, 67,094; St. Gilles, 61,748; Anderlecht, 60,318.

EDUCATION. Illiteracy is gradually decreasing, but in 1906 the percentage of recruits who could neither read nor write was still 9.80 per cent. of the total number, against 10.19 in 1905. At the end of 1905 there were 2,771 public infant schools, with 258,149 pupils; 7,144 primary schools, with 869,811 pupils; 4,077 adult schools, with 201,061 pupils; 58 normal schools, with 5,098 students; 88 male and 40 female middle-class schools, with 17,655 and 7,554 students respectively; and 35 royal colleges, with 7,673 students. Besides these public schools there are also many infant, primary and adult schools, about 80 colleges, 65 middle-class schools for boys and 150 institutions for girls—mostly controlled by the church. For higher education there are the State universities of Ghent and Liege, the free university of Brussels, and the church

university of Louvain, with about 6,000 students, besides 6 commercial high schools, 83 schools of design, royal and other schools of music, and the Royal Academy of Fine Arts at Antwerp, with over 1,000 students. Technical education in all its branches has reached a high degree of development.

AGRICULTURE. The area and production of the principal crops in 1905 were as follows, in hectares (1 hectare=2.47 acres) and metric tons (2,204 lbs. each): Wheat, 162,892 and 337,497; winter barley, 33,978 and 89,713; oats, 237,337 and 490,399; rye, 266,982 and 542,290; potatoes, 745,994 and 1,555,612; sugar beets, 64,175 and 2,101,334; other beets, 58,123 and 3,522,411; hops, 2,575 and 5,172. The wheat production in 1906 was 12,964,000 bushels, and in 1907, 12,000,000 bushels; of oats in 1906, 45,228,000 bushels, and in 1907, 45,000,000 bushels. The production of sugar beets in 1907-8 amounted to 1,620,000 tons; in 1908-9, 1,768,000 tons. The production of tobacco in 1906 was 20,927,359 pounds; in 1907, 19,476,206 pounds. At the end of 1905 there were 245,212 horses, 1,788,328 horned cattle, and 1,046,519 hogs. The average annual value of forest products is about 21,650,000 francs.

MIXING. The coal production of 122 mines in operation in 1906 amounted to 23,569,860 tons, against 21,775,280 tons in 1905. The number of coal miners in 1906 was 139,394, against 134,747 in 1905. There were in 1906 48 plants engaged in making briquettes, the output of which was 1,861,390 tons. The production of coke in 1906 was 2,414,490 tons. The iron ore production in 1906 was about 197,000 tons; pig iron in 1906, 1,431,460 tons, and in 1907, 1,327,940 tons, the bulk of the iron ore coming from Luxemburg. The output of spelter in 1907 was 154,000 tons. Quarrying employs over 37,000 men; its annual output exceeding \$12,000,000 worth of limestone, blue-stone, freestone, paving stone, phosphate of lime, clay, chalk and kaolin.

MANUFACTURES. The cotton industry employed in 1908 1,162,041 spindles, consuming during the year ending Aug. 31, 1908, 212,390 bales of cotton (116,877 American, 93,944 East Indian). Cotton weaving by machinery was carried on in 1907 in 61 establishments, employing 7921 workers, besides 2800 engaged in domestic weaving of cotton fabrics. Fabrics of pure wool or wool mixed with cotton were manufactured in 112 establishments, employing 8448 workers. The number of persons employed in weaving linen by machinery was 17,600. Out of a total of 45,500 lace makers in Belgium, West Flanders has 25,500, and East Flanders, 18,200. The industry is carried on at home, almost always by women in the villages, working to order and by contract, and paid by the piece. The contractors are located in Ghent, Bruges, and especially Brussels. They distribute their orders through middlemen, who frequently grow rich, while the lace makers receive barely sufficient wages to keep soul and body together. The industry is declining owing to competition of mechanical imitations, especially those of Venice, Chantilly, and Valenciennes, and to defective commercial organization. The carpet industry has almost completely disappeared from the Brussels district, the so-called Brussels carpets being now manufactured in Eng-

land and supplied to the Belgian market at prices much lower than those for which the same carpets can be produced in Belgium. The English are enabled to do this by using modern machinery and producing on a large scale. The Antwerp diamond industry employs between 4,500 and 5,000 men in 40 establishments. The tobacco industry employs about 9,800 workers in 616 factories. The raw sugar production in 1907-8 amounted to 238,200 tons, and was estimated at 258,100 tons for 1908-9. In 1908 there were 39 plants manufacturing electrical machinery, employing 5,9000 workers.

FOREIGN COMMERCE. The imports and exports (special trade) in 1907 amounted to 3,773,623,000 and 2,848,125,000 francs (1 franc=19.3 cents) respectively, against 3,454,017 and 2,793,840,000 in 1906. The transit trade in 1907 amounted to 2,343,016,000 francs, against 2,268,892,000 in 1906. The principal articles of import (special trade) in 1907 were as follows, in millions of francs: Cereals and flour, 565.8; wool, 220.6; timber, 159.4; resins and bitumens, including petroleum, 149.4; flax, 145.4; oleaginous seeds, 140.8; hides and skins, 122.1; iron and steel, 107.2; coffee, 109.4; coal, 96.5; diamonds in the rough, 92.6; chemical products, 90.8; machinery and vehicles, 90.6; cotton, 84.0; rubber, 75.4; dyes and colors, 70.0; living animals, 57.4; drugs, 49.7. The principal exports in 1907 were in millions of francs: Machines and vehicles, 260.6; iron and steel and manufactures thereof, 235.8; cereals and flour, 166.4; hides and skins, 110.6; flax, 106.7; wool, 102.7; cut diamonds, 94.8; linen yarn, 93.2; coal, 86.4; zinc, 84.8; glassware, 84.5; oleaginous seeds, 81.7; cotton tissues, 59.4; wool yarn, 56.7; chemicals, 52.9; sugar, 45.6; stones, 45.6; dyes and colors, 45.3; resins, etc., 45.3; manures, 42.2. The trade with the principal countries of origin and destination in 1907 was as follows, in millions of francs:

From and to	Imports	Exports
France	652.0	530.5
Germany, including Luxemburg	460.2	701.3
Netherlands	486.0	381.4
Russia	210.8	38.5
Rumania	206.4	21.0
Italy	46.2	99.1
Spain	60.8	31.1
United States	318.3	80.4
Brazil	80.7	33.7
Argentina	243.1	72.5
Chile.....	48.3	37.2
Congo Free State	58.7	18.5
British India	176.3	28.8
Australia	113.8	15.4

COMMUNICATIONS. In 1907 the ports of Belgium were entered by 10,306 ships of 13,465,447 tons, and cleared by 10,325 ships of 13,493,769 tons. The work of improving the canal from Ghent to Terneuzen, Holland, was progressing in 1908, and was expected to be completed about the beginning of 1909. The canal will permit the entrance of large Atlantic cargo boats to Ghent. Its length on Belgian territory is 10½ miles, and on Dutch territory 9½ miles. On Jan. 1, 1908, the merchant marine consisted of 77 steamers of 115,

852 tons, and three sailing vessels of 1,455 tons. Fishing boats numbered 419, of 8,033 tons. The length of railway at the end of 1907 was 2,879 miles, over 2,500 miles being worked by the State; of telegraph lines, 4,341 miles.

BANKS. The National Bank is the only bank of issue. On Dec. 12, 1907, its cash on hand amounted to 132,071,000 francs, and its note circulation, 735,989,000 francs. The State savings banks had at the end of 1905 2,311,845 deposits, aggregating 785,704,576 francs.

BUSINESS CONDITIONS IN 1908. The first nine months of 1908 showed a decline in imports, as compared with the same months in 1907, of about seven per cent., and in exports, three per cent. The export of Belgium coal declined from 3,730,900 tons in 1906 to 3,470,382 tons, and there was a corresponding decline in the export of coke and briquettes. The diamond industry of Antwerp suffered acutely from the falling off in orders from the United States, and nearly one-half the cutters were thrown out of work.

FINANCE. The revenue and expenditure in 1906 were 675,688,000 and 772,366,000 francs respectively, there being a deficit of 96,678,000 francs, against a surplus of 79,886,000 francs in 1905. The budget for 1908 estimated the revenue at 621,404,924 and the expenditure at 621,185,765 francs. The principal estimates of revenue were: Land tax, 28,300,000 francs; personal taxes, 24,440,000; customs, 53,111,250; excise, 80,603,750; registration tax, 36,895,000; succession tax, 25,000,000; railways, posts, and telegraphs, 316,520,300. The principal estimates of expenditure were: Public debt, 174,273,094; justice, 29,641,500; public instruction, 33,787,535; railways, posts, and telegraphs, 224,971,314; army, 57,116,974; gendarmerie, 21,277,665. The public debt stood on Jan. 1, 1908, at 3,364,611,550 francs.

ARMY. The neutrality of the country being guaranteed by several of the great powers, the army does not occupy the important place which it holds in most other countries. Recruitment is by voluntary enlistment for a period of thirteen years, eight in the active army and five in the reserve, but resort to conscription is authorized in case of necessity. However, there was a strong demand for military reform and army reorganization in 1908, and it was pointed out that the effective strength had been decreasing steadily for the five years previous so that there were only about 36,000 men actually in the ranks in November, 1908. The gendarmerie consisted of 26 officers and 2,125 men. The peace strength of the civil guard was 2,292 officers and 44,194 men. The war strength of the army is 2,513 officers and 97,316 men; of the civil guard, 157,537 officers and men. There is no navy.

HISTORY.

THE CONGO QUESTION. The dominant issue in the Belgian political record of 1908 was the Congo question. For several years past this question has drawn public attention by the scandals connected with King Leopold's administration of the Free State. (See Congo, paragraphs on *History*.) In 1908 plans for annexation were finally carried out and the treaty of cession whereby the King transferred the

Congo to the Belgian government was signed in August.

THE ANNEXATION MOVEMENT DOWN TO 1908. In late years the opinion had gradually strengthened that the annexation of the Congo by the Belgian government was inevitable. The right to take over the Free State had been definitely granted to the government by King Leopold in 1889, and this right was reaffirmed by the Belgian Parliament in 1901. Annexation was desired by an increasing party in Belgium, not only for reasons connected with international policy, but also on account of the pressure exerted from without in consequence of the scandals of the Congo administration. (See Congo.) Great Britain had constituted herself the champion of the natives, and had urged on the Belgian government measures of reform. In Great Britain the annexation was favored as the most practicable solution of the problem. Had it been a question of annexation pure and simple, that is, without any conditions, it would have been accomplished years before. But the King was unwilling to submit his royal African domain to the constitutional system of Belgium. When annexation was proposed, its conditions were such as would give the future administration a strictly absolutist character, and would retain the feature of royal control. According to the project at first discussed, the King would have concentrated in his hands both the legislative and the executive power; he would have controlled the budget and the Chamber of Deputies would have had no right to interpellate the ministers. In this form the treaty of cession was signed on Nov. 28, 1907, between the plenipotentiaries of the Belgian and the Congo governments, and was published on Dec. 6. Meanwhile, on Dec. 3, it had been sent to the Colonial Commission for examination. The matter of chief importance was the disposal of the Crown Domain, which had been marked off from the rest of the Congo some years before and had become the special property of the King. This had long been viewed with jealousy by many public men as a menace to constitutional government, in that it permitted the King to act without Parliament, and if occasion arose even against it. It was complained that it had led to interference in the internal affairs of Belgium, to the subsidizing of the press, the purchase of large properties and the conduct of expensive and wasteful "sumptuary" works which Parliament would not have sanctioned. Thus the works undertaken on the royal property at Ostend and at Laeken were paid for out of the revenues of the Crown Domain. The commission to which the instrument was referred was not chosen by the Chamber of Deputies, but by the President of the Chamber, and the majority was favorable to the government's designs.

THE ANNEXATION MOVEMENT IN 1908. On Dec. 31, 1907, the Premier, M. de Trooz died, and on Jan. 8, M. Schollaert, the President of the Chamber, succeeded. He declared that the time for decision of the question had arrived. Negotiations between the government and the King looking to the abolition of the Crown Domain took place in February. On the King's side a more conciliatory spirit was shown and a number of amendments were offered, chiefly, it is said, owing to the repre-

sentations of Great Britain and the signs of an aroused British feeling on behalf of reform. These amendments were embodied in the Additional Act of March 5, 1908, which suppressed the Crown Domain subject to certain conditions: Belgium was to carry out the sumptuary works begun or projected by the Congo Crown Domain in the royal properties at Ostend, Laeken and elsewhere; for which the special fund of 45,000,000 francs was to be created. A further sum of 50,000,000 francs, payable in fifteen annuities, was to be placed at the disposal of the King or his successor, "in token of gratitude for his great sacrifices on behalf of the Congo," and was to be used on public works in the Congo, the sanitation of the colony, the improvement of the negro, etc. The Belgian government assumed all the obligations contracted by the Crown Domain including payments of a certain annuity to Prince Albert, the heir presumptive, until he came to the throne, and to Princess Clementine till her marriage; also pensions to certain officials of the Domain, to missionaries, etc., and for the maintenance of the colonial collections at Stuyvenberg and the tropical greenhouses at Laeken. The government was bound to regard the rights granted by the Domain to the various concessionary companies. The fund of 50,000,000 francs must be made good from the colonial budget, out of which must be paid during a period of fifteen years an annuity amounting to a little more than 3,000,000 francs. "This will be dispensed by the King in the interests of the colony." At first this expenditure was not subject to ministerial countersign, but later the government agreed that ministerial approval was necessary, affirming, however, the principle that the King's initiative should be recognized, that is, that he should propose the various means of employing the money to the ministry instead of the ministry submitting its projects to the signature of the King. The debate began on April 15 and continued to July 16 when Parliament took up the consideration of the Colonial Law, which had also been submitted to the commission for examination and which provided the basis for the new administration. The ministry declared during the discussion of the treaty that all obligations resulting from conventions with foreign powers and from the Treaty of Berlin would be scrupulously fulfilled.

Despite the severe criticism of the measures, it soon appeared that Parliament on the whole favored them. The ministry were on the side of the King, and the majority did not wish to risk a ministerial crisis. The King's influence on the Catholic Right was increasingly powerful. The Left, to be sure, were opposed not only to the terms of the annexation but to the entire colonial policy; but there was dissension among both the Socialists and the Progressists. The various elements in the Opposition, however, agreed in general that the present terms of annexation were not only an infraction of the constitution but would impose a heavy charge on the finances, for in addition to the millions granted to the King and royal family, the Congo had a debt of 100,000,000 francs. In financial and high commercial circles the new arrangement was favored. The ministry wished to carry their policy through as soon as possible, in order

to dispose of it before the approaching elections, and because the British demands were pressing. Nevertheless, when the elections occurred the question was still pending.

The Colonial Law, which dated from the ministry of De Smet De Naeyer, had at first given the crown absolute power, making the King law maker and executive alike, giving him power to adjust the budget by royal decree and to nominate his own colonial council. As amended by the government, however, while the King retained legislative power, it was confined to such points only as had not been determined by laws passed by the Belgian Parliament; and the budget was to be voted by the Parliament. It was further provided that decrees authorizing loans chargeable to, or guaranteed by, the Colony, and work to be paid for out of extraordinary resources, should be issued only on the initiative of the ministers in council. No act of the King enjoys validity unless countersigned by the colonial minister, who thereby makes himself responsible. The régime set up for the colony comprises a Colonial Council composed of the Colonial Minister as president and ten members who must be drawn from outside of Parliament. Of these, six are appointed by the King, two by the Senate, and two by the Chamber. A permanent commission of seven members is charged with the protection of the native interests and the furtherance of their material and moral welfare. Its head is the Belgian procureur-général. The other members are appointed by the King from among the residents of the Colony. The commission must meet at least once a year and submit proposals for native legislation to Parliament. Its report must be made public.

The administrative head of the colony is the Governor-General. He names the public prosecutors. Magistrates are appointed and removed by the King, but dismissal can follow only on the demand of the procureur-général. The administrative authorities cannot interfere with the action of the courts, but the King may, in times of emergency, proclaim military rule within a specified district. Liberty of conscience and religious toleration are guaranteed to the natives but the Governor-General shall encourage the abandonment of polygamy, the spread of individual liberty and the development of private property. Belgians and foreigners are equal before the law.

THE ELECTIONS. On May 24, 1908, the elections for the Senate and Chamber required by the biennial retirement of half the members took place. They resulted for the Chamber in a gain of five by the Socialists, the loss of three to the Liberals, and of two to the government. The Clericals would have suffered a more severe defeat had it not been for the system of plural voting. The Chamber as thus constituted comprises 87 Catholics (Clericals), 43 Liberals, one Christian Democrat, and 35 Socialists. In the Senate the Catholics gained two and the Socialists three, while the Liberals lost five. This left in the Senate 63 Catholics, 47 members of the Opposition, and Prince Albert. The government had hoped that its majority, which had been diminished in the preceding election, would be increased by replacing with ministerial candidates several members of the Opposition whose previous election had been by

narrow majorities. In this they were disappointed, and actually lost three new seats, gaining only one. The actual ministerial majority was now only eight, and the election figures showed that the majority of the voters were against them. A significant feature of the election was the Socialist gains, which were interpreted by opponents of annexation as indicating popular hostility toward the measure, because the Socialists were more solidly against it than the Liberals.

BRITISH INTERVENTION. One reason why the King and his advisers had changed their earlier programme and taken the initiative in offering amendments to the treaty and the Colonial Law, was found in the growth of a hostile public opinion in Great Britain, and the remonstrances addressed to the Belgian government by the British Foreign Minister, Sir Edward Grey. In February, in the course of a debate in the House of Commons, Sir Edward Grey had said: "The present existing authority [referring to the Congo] is perfectly hopeless. * * * If you review the history of the hopes and aspirations with which consent was given to the foundation of the Free State, you cannot but come to the conclusion that the state has morally forfeited the right to international recognition." He said that in taking possession of the Congo the Belgian government must completely change the administration; and that while Great Britain had no wish to interfere in the negotiations between the Belgian government and the crown and would await their result, she would nevertheless have recourse to independent action and avail herself of her rights under the Berlin Conference, if after a reasonable interval no practical benefits were assured. He declared that "It must be a condition precedent to any transfer of the Congo to another authority, that that authority shall take it over on terms which will place it in a position to give assurances, and to guarantee that these assurances shall be carried out and the treaty obligations of the Congo shall be fulfilled." He referred to the publication of the United States Consul General's report on Congo conditions, and welcomed the coöperation of the United States.

The Belgian government declared that remarks of this kind embarrassed them in settling the question, as they tended to arouse the feelings of the Belgian people. It assured the British government that under the new arrangement the government would assume the responsibility for all obligations imposed by the Act of Berlin. In his reply on March 27, Sir Edward Grey declared that the labor tax system should be changed, as it practically introduced slavery and was in violation of the Berlin Act; that the system should cease to be obligatory; that the currency system should be introduced; that a far greater area of land should be allowed to the natives, and that British merchants and missionaries should be free to acquire parcels of land in any part of the state. On April 25, the Belgian government declared that it would facilitate the acquisition of land, insure the fair treatment of missionaries, and endeavor to improve the condition of the natives, but that the total abolition of the system could not be promised at a definite date. A correspondence was carried on between the

British and Belgian Foreign Offices, which was published by the respective governments in their official volumes.

The Congo Reform Association addressed a communication to Sir Edward Grey, expressing dissatisfaction with the proposed basis of annexation. Documents containing the reports of British consuls in regard to the affairs of the Free State were submitted to the British Parliament. In Belgium great resentment was shown against the charges of the consuls and of the Reform Association. Many of the statements were declared to be erroneous.

The attitude manifested by the United States government toward the question was the same as that of the British, but its course was less vigorous, owing to its less secure legal basis for interference. Secretary Root had at first assumed that the United States, not being a signer of the Berlin Act, had no right to interfere, but afterwards decided that such rights existed by virtue of the Brussels Act, guaranteeing the protection and development of native interests, and in April, in a communication to the Belgian government, declared that "The present situation is not that which was contemplated or foreseen when the Free State was called to life by the Powers." The Belgian government replied on April 24 and July 12 to the American and British communications, saying that while the concessions could not be abolished, important measures of reform would be applied. It declared that King Leopold's decree of June, 1906, gave the natives three times as much land as they now possessed, and that this decree would be enforced. The Belgian government throughout was profuse in general assurances of its intention to carry out reforms, but the nature of the measures before the Belgian Parliament did not satisfy the advocates of reform.

Two points, it must be noted, were especially emphasized in the British criticism above mentioned. In the first place it was said that the administration had not respected the rights of the natives. For years the forced system of labor which constrained the negroes to excessive service had been denounced by missionaries and travelers. In demanding that the system should be abolished, however, the British government conceded that the abolition should be gradual. In the second place the British notes pointed to the violations of the rule as to liberty of trade which was prescribed in the Congo under the Act of Berlin. They declared that it was only by virtue of an absolute commercial monopoly that the Congo administration could have derived its large profits. The principle invoked by the Congo government that vacant lands belonged to the state was not contested, but its application was denounced. For since landed property in the European sense did not exist in the Congo, the state had regarded as unoccupied land nearly the whole territory without regard to the needs of the natives. Moreover it had tried and condemned as robbers all who tilled the soil or hunted game on this land, even where no agent of the state had entered into possession. In thus keeping for itself or for concessionary companies everything that could properly be made the object of trade the administration had violated directly the rule of the Act of Berlin forbidding

commercial monopolies. The British government therefore desired the adoption of measures which, by giving the natives a right to cultivate an adequate area of land, by introducing a currency, and by the gradual suppression of forced labor, would make it possible for them to acquire the material for trade; also that the Belgian Parliament's control over the Congo should be real and effective. Such were the main lines followed in the diplomatic correspondences above mentioned during 1908. The negotiations were not concluded at the close of the year, the British government having reserved to itself the right to withhold its consent to the transfer of the Congo unless it were accompanied by satisfactory assurances that the reforms would be carried out.

ANNEXATION VOTED. The debate was resumed in the new Parliament, but it was soon evident that the measures as above outlined would be carried in spite of the criticism which they had encountered. The prevailing view appeared to be that something should be conceded to the King, who after all had spent his money freely and shown great energy; and that it was better to risk a few millions which might be expended in a manner that would not be approved, than to lose the chance of settling the question. On the other hand there were loud protests against the royal squandering and the increased burden on the finances that the conditions of annexation would impose. In the Chamber the treaty of annexation was carried on Aug. 21 by 83 to 54, nine members not voting.

The additional Act which contained the amendments suppressing the Crown Domain, etc., was carried by 83 to 55, nine members not voting, and the Colonial Law by 90 to 48, seven members not voting. The measures were debated in the Senate on Aug. 27, and the Treaty of Annexation was carried by 63 to 24, and the Colonial Law by 66 to 22. A strong element both in and out of Parliament opposed the measures, which, in spite of the modifications above mentioned contained many points that seemed to the opposition very objectionable. In the first place it was argued that the amendments which the government had accepted in the Colonial Law did not go to the root of the matter. They left to the King nearly all the powers that the first project had given him. For although the legislative power was restored to the Parliament its exercise was delegated to the King, who might by decrees determine any matters that were not already fixed by law. Another object of criticism was the recognition of the King's personal initiative in the expenditure of the 50,000,000 francs which were placed to his account. This was characterized as a dangerous innovation in a constitutional monarchy. As to the financial burden, it was complained that although by the Colonial Law the colony's debt would remain at the charge of the colony, the colonial budget was unlikely to balance, and heavy subsidies would be required. Moreover the principal resources of the Congo came from the exploitation of its domains, and if the monopoly which the previous administration had enjoyed were abolished and the forced labor ceased, these resources would considerably diminish. Finally there was the matter of the concessionary companies, some

of which had been formed but a short time before—arousing the suspicion that they had been made in order to take advantage of the annexation.

The status of these concessionary companies was one of the subjects of the negotiations between Great Britain and Belgium, the former having expressed the fear that the concessionaries, who had received very extensive powers, including, sometimes, the right to enforce the labor of the natives, would oppose the granting to the negroes of the more extensive rights over the land and its products which were essential to their improvement. The Belgian government replied that these concessions were given on the understanding that the rights of the natives would be respected. But this declaration was criticised as ambiguous, in that it did not make clear whether the rights here referred to were those which had been recognized at the time of the concession or the more extended rights which had been recently promised.

Patriotic Belgian opinion was inclined to resent the continuance of criticism from abroad as implying a lack of confidence in the willingness of the Belgian nation to deal fairly by its new colony. The transition from the Leopoldian régime to a better colonial system could not be effected without prolonged study and experimentation. An individual owner and ruler, looking only to his own personal advantage, might tolerate a policy of exploitation. But a nation, permanently shouldered with the management of a large colonial domain, might be trusted to avoid the ultimately suicidal policy of oppression and extortion. The interests of Belgians being now coincident with the interests of the colony, it was the duty of foreign critics to suspend judgment while the process of reconstruction was under way.

OTHER POLITICAL QUESTIONS. In the spring session, besides the vote on the budget, Parliament passed among other measures laws modifying the commercial code in regard to maritime shipping, providing for the registry of vessels engaged in the river trade, simplifying the formalities of marriage, giving women the right to serve as witnesses in civil cases, and permitting judicial instructions to be given in Flemish at the Assize Court in Brabant. In the summer session the energies of Parliament were absorbed in the discussion of annexation, and no progress was made toward the settlement of certain questions which had long been before the public and in regard to which the opposition demanded reforms. These were the questions of military reform, obligatory instruction and electoral reform. In the matter of military recruiting, some demanded the abolition of the privilege of substitution, requiring that everyone who had drawn "a bad number" should serve in person. Others insisted on the suppression altogether of the system of drawing by lot. This demand for "personal service" was of some years standing. In order to facilitate it the government had some years before succeeded in carrying a law reducing slightly the period of service in time of peace, and, to offset this diminution of the effectives, promising the volunteers a considerable advance in pay. This measure had been criticised severely in military circles. In the course of the year it was generally admitted

that the results were unsuccessful, that in spite of the advantages offered to the volunteers the numbers were not maintained.

As to the school question, freedom of education in Belgium is guaranteed by the Constitution. The Catholics have held that the establishment of public schools which would compete with Catholic schools under private or congregational control is a violation of this liberty. They have contended that the same advantages and the same subsidies that are granted to such public schools should also be granted to their own institutions, but subsidies to the free schools are still somewhat inferior to those of the public schools, and the Clerical party insists on equality. This applies to the communes, for they are charged by the Belgian law with the organization of primary education. It has been proposed that the communes shall be required to grant to the free schools the same subsidies that they bestowed on the communal schools. It would bear heavily upon the large communities, and the additional expense would, it is said, necessitate a considerable reduction of the school establishments. It was criticised as a Clerical measure, designed to place the Clerical schools everywhere in the majority. Under a compulsory system, it would be greatly to the Clerical interest.

As to the electoral reform, the Belgian system of elections is at present very inconsistent. Although the principle of proportional representation applies to the legislative elections, the provincial elections are still decided by absolute majorities, and the communal elections proceed on a mixed system, in which proportional representation is admitted if no ticket receives an absolute majority. The reform proposed would apply to the communal elections, the system of proportional representation employed in the legislative and provincial elections. The Liberals and Socialists furthermore demanded the abandonment of a system of plural voting. As now constituted and as shown by the May elections, the Belgian Chamber does not represent the actual status of political opinion in the country.

BELMONT, OLIVER HAZARD PERRY. An American capitalist, died on June 10, 1908. He was born in New York City on November 12, 1858; and, after graduating at the United States Naval Academy, served for two years in the navy. He was for a time in business at Bremen, Germany, and then entered the banking firm of August Belmont and Company. In 1900 he was delegate to the Democratic National Convention and in the same year was elected representative to the Fifty-Seventh Congress. He published the *Verdict*, an illustrated political weekly favoring free silver, which had but a brief existence.

BENZOATE OF SODA. See **FOOD AND NUTRITION.**

BERI-BERI. See **TROPICAL MEDICINE.**

BERMUDAS. A group of about 300 islands, reefs, and rocks, of which about 20 are inhabited, situated northeast of Florida, and constituting a British colony. The largest islands are St. George, Bermuda, Somerset, and Ireland. Total area, 19 square miles. Population (1901), 17,535, of whom 6,383 were whites; in 1906 it was estimated at 19,588. The chief town is

Hamilton, on Bermuda, with 2,246 inhabitants in 1901. About one-third of the area is under cultivation. The products and exports are mainly sweet potatoes, onions, lily-bulbs, bananas, arrowroot, and some corn. Under the direction of the local Board of Agriculture, the lily-bulb industry is rapidly recovering from the effects of the exportation of hybrid bulbs for true stock. The 1907 exports of lily-bulbs was valued at \$46,777. Foods are imported mainly from the United States and Canada. The imports and exports in 1906 were valued at £398,176 and £121,295 respectively. In 1907 imports from Great Britain were valued at £111,831, and exports to Great Britain, £1,831. For the fiscal year 1907-8 the imports of the United States from Bermuda were valued at \$571,993, and exports to Great Britain, £1,831. For the \$957,066. Owing to late delivery and the immense output of Texas, there was no sale for Bermuda's 1908 crop of vegetables and onions. Both dealers and planters suffered disastrous losses, but up to September, 1908, there were no failures or suspensions. The revenue in 1907 was £67,538; the expenditure, £59,172; and the public debt on Dec. 31, £46,100. Bermuda is an important naval station. In 1907 the naval force numbered 1,130; the military force, 1,202. The Governor in 1908 was Gen. Walter Kitchener.

BERNSTORFF, JOHANN-HEINRICH, COUNT VON. A German diplomat, Ambassador from Germany to the United States, born at London, Eng., on November 14, 1862. He was educated at Dresden, and in 1881 joined the First Regiment of the Artillery Guards. In 1889 he became attaché to the German legation at Constantinople, and, subsequently, served as secretary of the legation at Belgrade, Dresden, St. Petersburg, and Munich. He was made counselor and first secretary to the German embassy in 1902. On November 7, 1908, he succeeded the late Baron von Sternburg as German Ambassador to the United States.

BETHUNE, THOMAS G. An American negro musical prodigy, better known as "Blind Tom," died on June 13, 1908. He was born on a plantation near Columbus, Ga., about 1850. His parents were slaves belonging to Gen. Thomas G. Bethune, after whom he was named. Although blind and half-witted from birth, he early displayed extraordinary imitative musical powers; he could play even the most complicated piano piece after hearing it once performed. He made his first public appearance in New York City in 1861, and afterwards gave concerts throughout the United States and Europe. His repertoire embraced upwards of 5,000 selections, including some of Liszt's most difficult transcriptions. Increasing idiocy finally compelled his retirement from concert life. He spent the last years of his life at Hoboken, N. J.

BIBLE SOCIETY, AMERICAN. A religious organization founded in 1816 for encouraging a wider circulation of the Holy Scriptures without note or comment. The issue of the year 1907-8 amounted to 1,895,941 volumes, Bibles, Testaments, and Gospels, or other single portions. The 92nd annual meeting was held at the Bible House, New York City, May 14, 1908. During its ninety-two years of existence the society has distributed 82,316,323 volumes of the Scriptures, including those in foreign tongues and in languages and dialects of several American Indian

tribes. The Society has received since its organization contributions amounting to \$32,938.-282.50. It issues an illustrated monthly, the *Bible Society Record*, besides thousands of leaflets annually. The President of the Society, Daniel Coit Gilman, LL.D., died Oct. 13, 1908, and his successor had not been chosen at the end of the year. Secretaries are Rev. John Fox, D.D., Rev. William I. Haven, Rev. Henry O. Dwight, LL.D.; Treasurer, William Foulke.

BICYCLING (as a sport). See CYCLING.

BIKELA, DIMITRIOS. A modern Greek poet, translator and historian, died in Athens, on July 21, 1908. He was born in Greece, in 1835. His translation of the plays of Shakespeare into Greek (1876-87) is notable. He was a prime mover in the modern revival of the Olympic games. Besides his translation of Shakespeare, the most notable of his works include: *Stichoi* (poems, 1862); *Loukis Laras* (a novel, 1879; Eng. trans. 1881); and *Greece, Byzantine and Modern* (1893).

BILLIARDS AND POOL. The first important contest in 1908 for the professional world's championship at 18.1 balk-line billiards took place at Philadelphia on Jan. 23, Jacob Schafer defeating the challenger, A. A. Cutler, by 500 points to 476. On Mar. 11, Schafer defeated W. F. Hoppe by 500 to 423. In May, 1908, however, Schafer forfeited the championship emblem to George Sutton, because of ill health. In the 18.2 balk-line contest at New York on January 27, George Sutton defeated Ora C. Morningstar, challenger, 500 to 309. On Mar. 27, W. F. Hoppe defeated Sutton 500 to 272, winning the championship, but the emblem was later returned to the donors.

The National Amateur championship at 14.2 balk-line was again won by Calvin Demarest, who, after being tied for first honors with H. A. Wright and C. F. Conklin, defeated Wright. Demarest made a run of 202 in this contest, which is the highest on record. The World's Amateur Championship at ball pool was won by Thomas Hueston, who defeated Jerome Keogh 600 to 584. This victory made Hueston the permanent possessor of the trophy.

BIOLOGICAL CHEMISTRY. See CHEMISTRY.

BIOLOGICAL STATIONS. At Wood's Hole, Mass. Professor C. O. Whitman, founder of the Marine Biological Laboratory, and Director since its founding, resigned, and Professor F. R. Lillie was appointed to the position. Professor G. A. Drew is Assistant Director. The Marine Biological Association of the West of Scotland considerably enlarged its station, and put again in commission its steam yacht *Mermoid*. The Director of the San Diego, California, Marine Biological Station reported that a new vessel, the *Alexander Agassiz*, had been added to the equipment of the station, and with this it was possible to do much more accurate and thorough work than was previously possible in the plankton investigation of the area comprising the continental shelf from Point Conception southward. At a considerably less initial and much less running expense, this boat was able to do even more efficiently than a larger one the special work desired. Dr. C. A. Kofoid, assistant director of the station, spent a portion of the year in Europe in a study of the work that was being done by the International

Council for the Investigation of the North European Seas, in the hope of being able to coordinate more thoroughly the work of the San Diego Station with what was being done abroad. The Marine Biological Station at Port Erin, Isle of Man, reported in January, 1908, a very successful year in 1907. Experiments on lobster culture were carried on, and considerable progress was made in the submarine exploration of the Irish Sea. The Marine Laboratory at Roscoff, which is under the control of the University of Paris, reported that it was able to offer to students from abroad opportunity for work in private rooms at an annual rental of 1500 francs. The station has an admirable equipment, comprising aquaria, museum, library, collecting apparatus and boats and a few living rooms for investigators who may find it necessary to live near their work. The director is Professor Delage. In connection with Armstrong College, Newcastle-on-Tyne, the Dove Marine Biological Laboratory was founded by Wilfred H. Hudleston in memory of his ancestor, Eleanor Dove. Mrs. Reid, widow of a former president of the Bermuda Natural History Society, gave \$2,500 to the society for the use of the biological station now under the direction of Professor Mark, of Harvard.

BIOLOGY. As indicated in the YEAR BOOK for 1907, the rediscovery of Mendel's law of heredity led to a renewed interest in the subject, so far that a new science, "Genetics," has arisen. A great deal of this work was carried on during 1908, with results in general confirmatory of those previously obtained, though it was recognized that the law was much more complex in its operation than was at first supposed, and some apparent contradictions were still to be understood. Attempts were made to show that sex is inherited in accordance with this law. Wilson (See ZOOLOGICAL SOCIETIES) believed that the explanations were not satisfactory and that the problem of sex determination is in some way connected with the composition and behavior of the chromosomes of the sex cells. It is possible that a greater quantity of chromatin material is uniformly present in the female than in the male body cell, and that the presence of a greater or less amount of chromatin in the fertilized egg cell determines that it shall develop into a female or a male respectively. Conklin, discussing the mechanism of heredity, declared that it was an error to speak of hereditary transmission as if characters were bequeathed by parents to their offspring. The offspring resembles its parent because both are differentiated, by similar processes, from primitively similar material, all really inherited characteristics being predetermined in the structure of the germinal protoplasm. There is a species plasm, or individual plasm, continuous from generation to generation, but there is no satisfactory evidence that this differs from the general protoplasm of the young germ cells. The differentiations which occur in the development of a young germ cell are essentially similar to those which go on in later historical differentiations of the body, and both must be recognized as due to interactions between cytoplasm and nucleus. In this interaction the nucleus determines the formation rather than the localization of the different substances. Observation and experiment seem to Conklin to show that both the nucleus and the cytoplasm

of the egg and the spermatozoön have to do with determining hereditary qualities, but that all the early differentiations of the developing egg are determined by the cytoplasm of the egg cell. The nuclei of egg and sperm determine only the characters of the differentiations of later stages of development.

The most important questions connected with the modern discussion of the theory of evolution are 1st—Are acquired characters inherited? 2nd—How far have species arisen by means of mutations? 3rd—How far have species arisen by means of natural selection acting on slight variations (fluctuations)? 4th—What other factors aside from natural selection must we assume are at work in the evolutionary processes? In discussions on the inheritance of acquired characters, it is usually stated that such an inheritance is possible in Protozoa, where reproduction is merely the division of the body into two smaller individuals. A distinction is made between the Protozoa and the Metazoa in this respect, it being assumed that in the latter the germ cells are too far removed from the somatic to respond directly to changes in these. Jennings has shown, however, that in *Paramoecium*, when a new character appeared (e.g. a prominent spine at one end of the body of the animal) it would be transmitted to only one of the descendants at the time of division. This would happen also in the next generation, so that no matter how numerous the progeny may become, only one will possess this new character. Evidently there can be no question of the *Paranæcium*, and when a new character appeared tozoa. Not always would the character be continued even by one individual, as by a process of regulation the animal might resume its normal form. From this and other experiments he concluded that in order to be transmitted the modification of the protozoan cell must be such as to cause it to behave differently in reproduction. In this respect the germ cell of the metazoan is strictly comparable to the protozoan cell. Any permanent modification of the race must depend on such a change of the germ cell of the metazoan, or the entire body of the protozoan, as to cause it to behave differently in reproduction.

Francis Darwin, as president of the British Association, in his presidential address argued for the inheritance of acquired characters in plants, and showed how in many cases permanent effects were produced by external stimulations. This points to a sort of "mneme" which is primarily responsible for hereditary changes in both plants and animals. He believes that changes in somatic cells are conveyed to all cells of the body, in animals by means of nerves, in plants by protoplasmic connections, thus impressing characters even upon the germ cells of the body. Macdougall, on the other hand, thinks that in plants where structural modifications follow changed environment, these modifications are only accidentally adaptive. "No case exists" he says, "in which it is proved beyond reasonable doubt that any fully and continuously inheritable change has been induced in a plant by conditions of cultivation, outside of those due to selection, hybridism, and mutation."

President Jordan, choosing his illustrations from among fishes, says that no species can become distinct from others without some sort of

a physical barrier between the two. His law of germinate species is: "Given any species, in any region, the nearest related species is not to be found in the same region, nor in a remote region, but in a neighboring district separated from the first by a barrier of some sort, or by a belt of country the breadth of which gives the effect of a barrier."

Cunningham, who attempted to show some years ago that cesondary sexual characters are not due to selection, but to the use made of organs during reproductive periods, the effects of this use being inherited, in 1908 extended this theory to explain the probable mode by which the external characters are able to affect the germ cells. Basing his theory on the known facts of internal secretions, he supposes that secretions, "hormones" set free from any organ, and formed by the activity of that organ, are carried by the blood to the developing gametes, and so modify them as to produce in the next generation a duplication of the modification impressed on the body of the parent. For example, stags, when fighting, produce modifications of the surface of the skull. The hypertrophy thus produced forms hormones which are carried as above stated by the blood, and a corresponding hypertrophy, leading in this case to a horn, appears in the offspring.

It will be apparent from the above, that in 1908 we were still far away from any agreement as to the factors of evolution. It seemed probable that this condition would persist until some one devises and carries through to completion some conclusive experiments. That the conditions surrounding the struggle for existence are not as severe as is usually claimed by the Darwinians, is indicated from observations by Kellicott, from a study of practically a whole natural group of toads. As many as 8.75 per cent of individuals had one or both feet crushed, one foot missing, etc. In spite of these considerable disadvantages, the individuals were perfectly able to exist. Plate published during the year the third edition of his "*Darwinischen Selektionsprinzips*," which was considered the most comprehensive survey of the whole field of post-Darwinian literature that we have. In it he took a definite stand in favor of the Lamarckian factor.

While in recent years there has been a tendency to interpret more and more of vital phenomena as dependent on chemical and physical phenomena, the doctrine of a vital force is beginning to reassert itself. Of its supporters Driesch is perhaps the best known. In his Gifford lectures he developed the idea of an "entelechy" or vital principle supervising the life processes of the organism, and most in evidence in cases of regeneration and regulation. Another vitalist is Schneider, whose *Versuch einer Begründung der Deszendenztheorie* appeared in 1908. He supposes a special vital substance which has the same relation to vital energy that the ether of the physicist has to radiant energy. This vital substance consists of "physical substances" residing in the structural units of the organism.

BIRD, FREDERICK MAYER. An American clergyman, editor, educator, and hymnologist, died on April 2, 1908. He was born in Philadelphia on June 28, 1808. He graduated at the University of Pennsylvania in 1857, at Union Theological Seminary in 1860, and was ordained

as a Lutheran Minister. He served as an army chaplain in the Civil War (1862-63), and then filled several pastorates until 1868. In that year he left the Lutheran church and was ordained deacon in the Episcopal ministry. In 1881-86 he filled the chair of psychology, Christian evidences, and rhetoric at Lehigh University. He was for five years (1893-98, editor of *Lippincott's Magazine*. As a hymnologist he was reckoned one of the leading authorities in the United States. Among numerous hymn books edited wholly or in part by him are: *Lutheran Ministerium Hymns* (1865; with Dr. B. M. Schumaker. rev. ed., 1868); *Charles Wesley Seen in his Finer and Less Familiar Poems* (1867); *The General Council's Church Book* (rev. 1868); *Songs of the Spirit* (1871; with Bishop Odenheimer). He also was editor of Presbyterian and Moravian hymnals. He wrote several encyclopædic articles on hymnology, and was himself the editor of *Chandler's Encyclopædia* (1898). In 1893 he published *The Story of Our Christianity*.

BIRD PROTECTION. See ORNITHOLOGY.

BIRTH RATE. See VITAL STATISTICS.

BISMARCK ARCHIPELAGO. A group of islands northeast of German New Guinea, to which it is attached administratively. Including the German Solomon Islands (q. v.), the area is estimated at 22,000 square miles, and the population at 250,000. In 1907 there were 310 foreign colored, mostly Chinese, and 360 whites (255 Germans). The total cultivated area in 1907 was 12,102 hectares. The chief products are copra, rubber, coffee, and kapok. The cotton production in 1907 was 2,491 pounds. In 1906 the imports amounted to 2,390,000 marks, and the exports, 1,513,000 marks (copra, 1,376,000).

BISON RESERVATION. See ZOOLOGY.

BLACKBURN, JOSEPH CLAY STYLES. An American politician, member of the Isthmian Canal Commission and ex-United States senator (Democrat) from Kentucky, born in Woodford County, Ky., on October 1, 1838. He graduated at Centre College, Danville, Ky., in 1857, and the following year was admitted to the bar, and began his law practice in Chicago. During the Civil War he served in the Confederate Army as aid-de-camp to Gen. William Preston until the winter of 1864, when he received an independent command in Mississippi. After the war he practised law in Versailles, Ky., and in 1870 was elected to the State legislature, of which he remained a member until 1875, when he was chosen on the Democratic ticket as representative to Congress. He was reelected to the Forty-fifth, Forty-sixth, Forty-seventh, and Forty-eighth Congresses and then was sent to the United States Senate, where he served continuously, with the exception of the period 1897-1901, until March 3, 1907. Gen. Blackburn was prominent in the councils of his party and in 1906 and 1907 he was accorded the honor of the chairmanship of the Democratic caucus in the Senate. On April 1, 1907, he became a member of the Isthmian Canal Commission by appointment of President Roosevelt. As a member of this commission Gen. Blackburn has charge of the Department of Civil Administration in the Canal Zone.

BLAYDES, FREDERICK HENRY MARVELLO. An English classical scholar, died on Sept. 8, 1908.

He was born in Hampton Court Green (near London) on Sept. 29, 1818, studied in St. Peter's School, at York, in 1830-36, and at Christ Church, Oxford, where he was awarded the Hertford scholarship in 1838, and second class honors, *Lit. Hum.* in 1840. In 1843-86 he was vicar of Harringworth, Northamptonshire. Blaydes is best known as the editor of *Aristophanes*, especially of the splendid Halle edition (12 vols. 1880-99) of the plays, fragments, and scholia,—a notable improvement on Dindorf's Oxford edition,—supplemented by his *Adversaria on the Fragments of the Comic Greek Poets*. It is no exaggeration to call him the foremost critic of Aristophanes in the nineteenth century. Blaydes edited, besides, *Sophocles* (1859-80), with English commentary, and the *Oresteia* of Aeschylus, 3 vols., with Latin notes.

BLIND TOM. See BETHUNE, THOMAS G.

BLOOD. THE PRECIPITIN TEST for the identification of human blood is of great importance in medico-legal practice when questions arise as to the identity of a given specimen of blood. The test depends upon the fact that a precipitate will be thrown down in a mixture containing human, as distinguished from animal, blood, on the addition of a specially prepared serum. The details of the test are as follow: A rabbit is injected several times, at intervals of a few days. There is formed in the animal's blood a substance which will produce a precipitate in diluted human blood serum. After a week the rabbit's blood is withdrawn and the serum separated. The specimen to be tested, if fresh, is diluted 100 times, but if dried, the material is soaked with distilled water and the filtered solution mixed with an equal volume of double normal salt solution. To this clear solution a few drops of the serum of the immune animal are added and the mixture allowed to stand. If human blood is present a precipitate will occur within a half hour. The precipitate is specific for human blood as distinguished from that of other animals except those of the ape. Similar serum can be prepared which will be specific for each species of animal. Ulenhuth reports a number of remarkable cases illustrating the value of the test. A man was accused of murder. He alleged that the blood stains on his clothing were due to the drippings from some meat. The precipitate test gave a positive reaction for human blood. A man had entered a claim for sick benefits, having been found in bed with the bedclothes soaked in blood. He claimed to have had a hemorrhage during the night, but the precipitate showed that the blood on the bedclothes was bovine, as he afterward confessed. He had emptied a bottle of ox blood on the bed. Kochel reports the case of a man who claimed, as the result of an accident, to be suffering from hemorrhage from the urinary tract. The precipitate test gave a positive reaction for pig's blood, and it developed that he was pouring pig's blood into his urine from a phial.

BLUMENTHAL, JACQUES (JACOB VON). A German-English pianist, composer, and teacher, died on May 18, 1908. He was born at Hamburg, in 1829; studied harmony, counterpoint, and composition under Grund, Bocklet, and Sechter at Vienna, and piano under Halévy and Herz, at Paris. In 1848 he went to London, where his brilliant playing won him instant recognition. He became a naturalized British subject,

and was appointed court pianist to Queen Victoria. The later years of his life were devoted to teaching and composition. He composed several piano pieces and a great number of songs, of these are: "My Queen"; "Requital"; "The one time exceedingly popular. The best known of these are: "My Queen"; "Requital"; "The Message"; and " 'Tis but a Little Faded Flower,"

BOISSIER, MARIE LOUIS GASTON. A French writer and educator, secretary of l'Académie Française after 1895, died on June 10, 1908. He was born at Nîmes on August 15, 1823, and was educated at l'École de Paris. He was professor of rhetoric at Angoulême (in 1847,) at Nîmes (in 1847), and at the Lycée Charlemagne, Paris, (in 1857). In 1861 he became professor of Latin oratory at the Collège de France, and four years later was made *maître de conférences* at l'École Normale. Subsequently he was professor of Latin literature at the Collège de France and a member of the superior council of public instruction. In 1878 he was elected to the French Academy, of which, in 1895, he was chosen permanent secretary. He was received into l'Académie des Inscriptions et Belles Lettres in 1886. His writings deal principally with Latin literature and antiquity and are remarkable for their simplicity, succinctness, and readableness. They include: *Le poète Attius*, (1857); *Etude Terentius Varron* (1861); *Recherches sur la manière dont furent recueillies et publiées les lettres de Cicéron* (1863); *Cicéron et ses amis*, (1865), his best work; *La religion romaine d'Auguste aux Antonins* (1874); *L'opposition sous les Césars* (1875); *Promenades archéologiques. Rome et Pompéi*, (1880), and *Nouvelles promenades archéologiques. Horace et Virgile* (1886); both well known works; *Madame de Sévigné* (1887); *La fin du paganisme* (1891); *Saint-Simon* (1894); *L'Afrique romaine* (1895); *Tacite* (1903 Eng. trans. 1906); *La conjuration de Catilina* (1906). Boissier also contributed to the *Revue de l'Instruction publique*, *Revue des Deux Mondes*, *Revue de Philologie*, and *Journal des Savants*.

BOLIVIA. The only inland republic of South America. Area, 473,560 square miles. Population (1906), estimated at 1,953,916. The principal cities, with their population according to the latest estimates, are: Sucre, the capital, 20,907; La Paz, 60,031; Cochabamba, 21,886; Oruro, 22,000; Potosi, 20,910; Santa Cruz, 18,335; Tarija, 6,980; Trinidad, 4,294.

PRODUCTION AND COMMERCE. Wheat, maize, barley, and potatoes are produced mainly for local consumption, but a small amount of maize and maize flour is exported. Agriculture is in a primitive condition. Small quantities of cacao, coffee, and quinine are exported to adjacent countries. India rubber, which grows wild in the primeval forests, alpaca wool, and chinchilla and vicuña skins constitute important exports. White and yellow cotton grow wild. The chief wealth of the country lies in its minerals—tin, copper, gold, and silver. Next to the Malay Peninsula, Bolivia is the foremost tin producer in the world. In 1907 the output of tin barilla, or concentrates, amounted to 27,677,781 kilograms (1 kilogram = 2.205 pounds), representing 16,608,669 kilograms of pure tin valued at 29,892,003 bolivianos (in July, 1908, the boliviano was worth about 39.3 cents, and in Oct. 1907, about 49.9 cents). Both the quan-

tity produced and its value were lower in 1907 than in the preceding year. Potosi is the most extensive silver mining region in the country, but is awaiting the construction of railways and the application of modern processes for its full development. The Huanchaca mines, near Uyuni, are equipped with modern machinery and are in full operation. The copper mines at Corocoro are very rich, but their development on a large scale has not yet been attempted. The total imports in 1906 and 1907 were valued at \$17,544,000 and \$15,159,000 respectively, and the total exports, \$20,133,000 and \$27,827,000. The principal exports in 1907 were: tin, \$11,957,000; rubber, \$3,537,000; silver, \$2,593,000; copper, \$1,025,000; bismuth, \$314,000. The trade is principally with Great Britain, Germany, France, Argentina, Peru, Chile, and the United States.

COMMUNICATIONS. In 1908 there were over 400 miles of railway, 2,300 miles of wagon roads, and over 2,900 miles of telegraph lines, of which the government owns over 1,800 miles. Navigation on Lake Titicaca and the rivers, of which 12,000 miles are navigable, is carried on in both government and private vessels. The railway lines between Viacha and Oruro, 127 miles long, were completed by the middle of 1908, resulting in through railway communication from Lake Titicaca to the town of Uyuni, 363 miles. It was constructed by the Messrs. Speyer and Co. and the National City Bank of New York, who were to start next the line from Uyuni to Tupiza, 125 miles. By agreement with Argentina, the latter country was to construct a railway from Quiaca to Tupiza and thence to Potosi (see ARGENTINA). The contract for the Arica-La Paz line, which was being constructed in accordance with the treaty of October, 1904, with Chile, was taken by the Deutsche Bank of Berlin in Nov., 1907.

GOVERNMENT. For the president, see paragraph *HISTORY* below. The Congress is composed of a Chamber of Senators, and a Chamber of Deputies. The first has a membership of 16, and the second of 75.

FINANCE. The national revenues for 1907 were estimated at 13,583,333 bolivianos, and the expenditures at 14,549,793 bolivianos. For 1908 the budget estimates were 16,025,379 and 18,618,515 bolivianos respectively, showing a deficit of 2,593,136 bolivianos. There is no external national debt. The internal debt stood in 1907 at 4,346,529 bolivianos, besides treasury notes of 2,500,000 bolivianos bearing 8 per cent. interest.

ARMY. Military service is compulsory for all males between twenty and fifty years of age, and this law, hitherto very leniently enforced, was given much more attention in 1908 than had been customary. The peace strength of the army was about 2,500 men at the beginning of 1908 and this was increased by a regiment of cavalry and one of field artillery during the year. The war strength is about 177,800 men. The infantry was armed with a Mauser rifle and the field artillery with modern rapid-fire Creusot guns.

HISTORY. On May 4, 1908, Señor Fernando E. Guachalla, formerly minister at Washington and member of the Pan-American and Hague Conferences, was elected President by a majority of 20,934. He died, however, before his inauguration, and the outgoing president, Señor Montes continued in office. On Jan. 31,

1908, Bolivia signed a convention with Peru for the regulation of the free transit of merchandise through such ports as the Peruvian government should designate for Bolivian commerce, in accordance with the Treaty of Commerce and Customs of Nov. 27, 1905. It was to be in force until July 1, 1911, at which time it might be continued indefinitely unless either of the Governments should denounce it, in which case it was to terminate after one year's notice. The boundary question with Peru was under discussion during the summer, but having been submitted to the arbitration of the President of Argentina, gave promise of satisfactory settlement. Relations with Peru, with whom Bolivia already had a treaty of commerce, continued in all other respects to be most friendly, and Bolivian relations with other states were cordial. President Montes read his message at the opening of the Bolivian Congress on Aug. 6. He referred to the friendliness between Bolivia and all other countries. He announced that a Treaty of Amity and Commerce with Germany would be submitted to Congress, that a commercial treaty with Great Britain relating to the rights of the subjects of the two countries was being negotiated, and that delimitation of the frontier of Brazil by the Survey Commission was progressing satisfactorily, as well as the adjustment of the boundary question with Peru. On Dec. 31 there was promulgated an act of Congress by which the gold standard was adopted for Bolivia and a system of coinage and currency was decided on. English and Peruvian pounds of a value of 12.50 bolivianos each, and half pounds valued at 6.25 bolivianos, will circulate in Bolivia, and will be unlimited legal tender in all transactions. In addition, the President was to have coined and issued subsidiary coinage of silver and nickel to the value of 4,000,000 bolivianos in the case of the former and 1,000,000 bolivianos for the nicked coinage. The silver coinage was to be legal tender up to 12.50 bolivianos and the nickel coinage up to 1 boliviano. It was provided that the government should exchange English pounds for this subsidiary coinage at the rate provided for in the law of Nov. 30, 1904, and the silver coin in circulation was to be taken in exchange at the same rate.

BOLL WEEVIL. See COTTON.

BONNER HUGH. Commissioner and former chief of the New York Fire Department, died on March 13, 1908. He was born in Ireland, on June 14, 1839, and was educated in the public schools of New York. He entered the fire department of that city in 1860, and served as a volunteer until 1865 when the paid department was organized. He operated the first self-propelling fire engine and chemical engine, and the first water tower used in the department; became battalion chief in 1872, second assistant chief in 1883, first assistant chief in 1884, and was chief from 1889 until 1899, when he resigned. Bonner was selected to organize the Havana and Manila fire departments soon after the American occupation, and on the resignation of Commissioner Lantry he was appointed Fire Commissioner by Mayor McClellan, which office he held at the time of his death. In this capacity he was beginning to improve the discipline and effect reforms in the department. Bonner devised many improvements in fire fight-

ing appliances, and was an intelligent and persistent student of his subject.

BOOTS AND SHOES. This industry shared in the general depression of 1908 and the production was diminished correspondingly. The shoe shipments from Boston, which are estimated at 75 per cent. of the output of New England and 50 per cent. of the total production of the United States, and are regarded as the statistical index of the industry, during 1908 were 3,698,818 cases, as compared with 4,730,636 cases in 1907 and 5,082,578 in 1906, which was the record of maximum production in any single year. Labor troubles played some part in the activities of the year, particularly in Brockton, and several plants moved to country places, while others were contemplating such a step. So seriously did this threaten that towards the end of 1908 a citizens committee was established, and while its labors were not completed at the end of the year, some progress had been made towards securing a better understanding between employers and operatives. This tendency towards dispersion, if carried out, may have an important effect on the shoe business, as it is one that can be carried on in small factories almost as economically as in immense plants, and if these are isolated and located in rural districts were organized labor cannot flourish the effects may be quite interesting. Brockton, while being a centre of trades union activity, has so many shoe shops that the best workers in the country have been attracted there, so that it has been advantageous to locate shoe factories there in order to enjoy the highly skilled and efficient labor thus brought together. Shoe manufacturers naturally were interested in tariff discussions and many of them were in favor of ree hides. The uncertainty, as regards tariff charges was reflected in the year's business toward the end of the year.

BORNEO. One of the great islands of the world, with an area of 293,500 square miles and a population of 1,680,000. Politically, Borneo is divided into British Borneo and Dutch Borneo. British Borneo consists of British North Borneo (q. v.), Brunei (q. v.), and Sarawak (q. v.). For Dutch Borneo, which includes rather more than two-thirds of the island, see under DUTCH EAST INDIES.

BOSNIA AND HERZEGOVINA. Formerly Turkish provinces, occupied and administered since 1878 by Austria-Hungary, but by a proclamation of Oct. 7, 1908, by Emperor Francis Joseph, annexed to Austria. Area, 19,702 square miles; population, estimated in 1906 at 1,770,353. The people are mainly of Serbo-Croatian stock. In 1895, when the population numbered 1,568,092, Mohammedans made up 35 per cent. of the total; Greek-Orthodox, 43 per cent.; Roman Catholics, 21.3 per cent.; Jews and others make up the remainder. The largest cities in 1895 were Sarajevo, the capital, 41,543 inhabitants; Mostar, 17,010; Banialuka, 14,812; Dolnia Tuzla, 11,034. Education is free, but not compulsory. In 1906 there were 5 gymnasia, *realschule*, 1 military college, 11 advanced schools, for girls, 9 commercial schools, 352 elementary schools, 855 lower Mohammedan schools, 1 Greek-Orthodox and 1 Roman Catholic seminary for priests, 3 training colleges for teachers, and a college of Mohammedan law. Technical and industrial schools exist in most of the larger towns. The teaching of practical agriculture has been introduced in the village schools. Forests cover

over one-half the total area. Maize, wheat, and other cereals, potatoes, flax, hemp, tobacco, sugar-beets, inferior wine, and fruits are cultivated, and live stock rearing is important. Silk culture has been introduced. In 1906 there were exported 30,348 tons of dried plums and marmalade. In 1907 the export of tobacco and its products, mainly leaf, amounted to 622,058 kilos, valued at 1,490,166 kronen, while the import of tobacco amounted to only 1,526 kronen in value. The mineral and metal production in 1907 was as follows, in metric quintals (1 quintal = 2.0½ lbs.): iron ore, 1,506,841; chrome ore, 3,096; sulphur ore, 72,290; manganese ore, 70,000; brown coal, 6,211,788; raw iron, 489,458; wrought iron, 50,721; Martin ingots, 311,800; rails, 242,332; salt, 211,479. The total value of the mining production in 1907 was 4,511,799 kronen, an increase of 474,745 kronen over 1906; of the furnace production, 11,498,968 kronen, an increase of 624,162 over 1906; while the total net value of the mineral and furnace production (*i. e.*, after deducting the value of ores used in furnaces) was 13,458,125 kronen, an increase of 942,912 kronen, or 7 per cent. over 1906. The number of employees in the mineral, furnace, and salt works in 1907 was 6,643, an increase of 396 over 1906. The province is included in the Austro-Hungarian customs territory. The chief imports are cotton goods, cereals, and flour, clothing, colonial goods, leather, machinery, sugar, beverages, and iron manufactures. The chief exports are cereals and flour, beverages, wood, coal, and other fuels, live animals, animal products, vegetables and fruits, chemicals, iron and iron manufactures. In 1907 the imports totalled 114,492,195, and the exports 112,100,703 kronen. The length of railways in operation in 1908 was 783 miles; of telegraph lines in 1907, 1749 miles.

Previous to 1908, the administration of the provinces was under the direction of the Bosnian Bureau, which formed a section of the Austro-Hungarian Ministry of Finance. The provincial administration, centred at Sarajevo, consisted of the departments of internal affairs, finance, justice, and public works. For purposes of local administration there are 6 districts, subdivided into 54 circles. The budget for 1908 estimated the revenue at 66,487,959, and the expenditure at 66,442,018 kronen. Military service is subject to the same conditions as in Austria-Hungary. The army of occupation, hitherto numbering under 20,000, was greatly increased in 1908. The political situation will be found discussed under BALKAN QUESTION, paragraph *Austrian Annexation of Bosnia and Herzegovina*, and AUSTRIA-HUNGARY, paragraphs on *History*.

BOSTON PUBLIC LIBRARY. A public institution which embraces the library system of Boston, Massachusetts. It was founded in 1854. The total number of volumes in the library on Dec. 31, 1908, was 941,024 volumes; the total circulation in 1908 for home use was 1,555,027 volumes, of which 392,135 volumes were from the central library and 1,162,892 from branches and stations. The library had in 1907 28 branches throughout the State. The librarian is Horace G. Wadlin.

BOTANICAL SOCIETY OF AMERICA. A learned society of national scope, organized in 1893 as an outgrowth of the Botanical Club of the American Association for the Advancement of Science. Its membership in 1908 was

91, with 41 associates. It was enlarged in 1906 by federation with the Society for Plant Morphology, and Physiology, and the American Mycological Society. The President is Professor W. F. Ganong, Northampton, Mass., and the Secretary, Professor D. S. Johnson, Baltimore, Md. See BOTANY.

BOTANY. Considerable activity was to be noted along the various lines of botany during 1908. In taxonomic botany there were published many floras, monographs, descriptions of new species, etc. Along other lines of botanical activity some of the results are given below. The Botanical Society of America met jointly with the Botanical Section of the American Association for the Advancement of Science at Baltimore Md., Dec. 28, 1908, to Jan. 1, 1909. The vice-president of Section G was Dr. C. E. Bessey and of the Botanical Society, Dr. Geo. F. Atkinson. The British Association for the Advancement of Science had as its president a botanist, Prof. Francis Darwin. At the Baltimore meeting a symposium on ecology was a prominent feature of the programme, and on Jan. 1, 1909, it was proposed that the botanists and zoologists, together should celebrate the centennial of the birth of Charles Darwin and the fiftieth anniversary of the publication of his *Origin of Species*. A society of American Plant Pathologists, with Dr. L. R. Jones, of the Vermont Agricultural Experiment Station, as president, and A. D. Selby, of the Ohio Agricultural Experiment Station, as secretary, was organized. In connection with Cambridge University, England, a chair of agricultural botany was established, and Prof. R. H. Biffin was called to it.

LITERATURE. A number of important books on botany were issued during the year, among them a new edition of Strasburger's *Botany*, translated by W. H. Lang; *The Heredity of Acquired Characters in Plants*, G. Henslow; *A Handbook of Experimental Morphology*, K. Goebel; seventh edition of *Gray's Manual of Botany*, B. L. Robinson and M. L. Fernald; *North American Trees*, N. L. Britton and J. A. Shafer; *Mushrooms, Edible and Otherwise*, M. E. Hard; *Laboratory Course in Plant Physiology*, W. F. Ganong; four parts of the *North American Flora*, issued from the New York Botanical Gardens; *A Memoir on the Effect of Rays of Radium on Plants*, C. S. Gager; contributions from the Carnegie Institution which included *The Physiology of Stomata*, F. E. Lloyd; *The Topography of the Chlorophyll Apparatus*, W. A. Cannon; and *Botanical Features of the North American Deserts*, D. T. Macdougall.

Among prominent botanists who died during the year were Dr. W. A. Kellerman, for 18 years professor of botany at the University of Ohio, and Prof. Dr. Fritz Noll of the University of Halle, who is known as one of the joint authors of the so-called *Bonn Text-book of Botany*.

PLANT BREEDING. The interest in plant breeding is world-wide, and much progress was reported in 1908 from the United States, England, Germany, France, Austria, Sweden, and Italy. The greatest amount of work along this line in the United States was being carried on by the U. S. Department of Agriculture and the agricultural experiment stations (*q. v.*), but the work of Burbank and of the Carnegie Laboratory of Experimental Evolution must by no means be overlooked. The work of the Department of Agriculture and the experiment stations had already resulted in new varieties of cereals, cotton, tobacco,

co, pineapples, fruits, etc., that have desirable characters not possessed by former ones. In many of the experiments resistance to disease had been sought, and immune varieties of a number of staple crops had been secured that would make possible the cultivation of these crops in regions where their growth was practically abandoned. Among some of the prominent immune varieties were cotton and sowpeas immune to wilt, flax immune to wilt, clover that withstands anthracnose, tobacco that resists wilt, etc. Wood, Lock, Prunnett, Cramer, Cook, Waugh, Davenport, Henslow, and others published the results of their observations and experiments on heredity, variation, bud variation, etc. Lock summarized the recorded facts regarding heredity in peas and showed that the behavior of the characters in the testa and corolla conformed to Mendelian principles of segregation. Henslow, in a recent work, claimed that evolution, so far as plants are concerned, depends upon the inheritance of acquired characters, and that Darwin definitely announced this hypothesis in correspondence subsequent to the publishing of his *Origin of Species*. Biffin was continuing his studies in rust of wheat, and by hybridizing, secured varieties of wheat that are immune to rust. Hayman, in India, was experimenting along similar lines. The American Breeders' Association, organized to study the laws of plant and animal breeding, held its annual meeting in Washington, D. C., Jan. 28-30, 1908.

PLANT PHYSIOLOGY. There were announced during 1908 the results of many investigations relating to the rôle of certain substances and the functions or organs, structure, etc., in the economy of the plant. Deleano claimed, that under certain conditions plants return to the soil a portion of the mineral matter taken up through their roots. Stoklasa showed that there was an intimate connection between the assimilable potash present and the carbon dioxide assimilation of plants. Phosphorus is shown to play an important rôle in the production of chlorophyll, and Scurti claims that a correlation exists between the presence of phosphorus and the formation of proteids in plants. Proteids in seeds are directly formed from asparagin, according to Wassilieff. The rôle of fat, so far as molds are concerned, was proved to be that of a reserve material which is drawn upon during spore formation, as shown by Dubaquié, and not an elimination product, as was often claimed. Studies on the nature and function of chlorophyll were continued in many laboratories. Tsvett claimed that what is commonly called chlorophyll is in reality a mixture of two materials, chlorophyllin A and chlorophyllin B. The first, which is four or five times as abundant as the other, is of a bluish color when extracted from ether, the other green. Lubimenko found that the maximum production of chlorophyll and the optimum for photosynthesis did not coincide. He found that the optimum of photosynthesis took place in young leaves of shade-loving species and in the old leaves of the intolerant ones. He also showed the necessity of confined atmospheres within pods of peas and similar plants for the normal development of their seeds. Shaw, by comparing actinometer and black-bulb thermometer readings at mountain stations, found that light at high altitudes had a different morphogenetic value from that of the lowlands. Balls claimed that the injurious

effect of high temperatures on the growth of plants was due to the accumulation within the cell of catabolic products, and not the disorganization of the protoplasm by heat.

The presence of cyanogenetic compounds in plants was still receiving attention, and Dunstan and Henry reported poisonous quantities in red and white varieties of Burma beans. Guignard claimed that if free hydrocyanic acid was formed during germination in plants, it immediately disappears to form glucosides and other compounds. Greshoff demonstrated the transitory occurrence of cyanogenetic compounds in a number of plants not hitherto investigated, among them ferns and a number of species of arrow grasses, Juncaginaceæ. Couperot added 14 species of plants, 8 of them grasses, to the already long list of those known to yield hydrocyanic acid under certain conditions. Ciamician and Ravenna, in studying the rôle of glucosides, concluded that they are reserve materials, and that in this form the plant stores substances which in a free state would not be tolerated.

In studies of the nutrition of plants, Hasselbring has shown that some of the lower plants readily assimilate alcohol, acetic acid, and similar substances to supply their carbon requirements. Petit practically tested the ability of plants to utilize glucose absorbed through their roots by attempting to force a number of species grown in large pots, but with negative results. In some cases the glucose proved injurious. The action of sulphur dioxide, arsenic, and other substances in the smoke and gases of smelters, blast furnaces, etc., continue to be a subject of investigation, and Weiler found that sulphur dioxide in the air seriously interfered with carbon dioxide assimilation. Haywood showed that forests were injured by sulphur fumes to a distance of 15 miles from a large smelter, and that arsenic was present in considerable quantities. Hasselhoff reports similar observations in Germany. Gerlach found 0.465 per cent., sulphuric acid in twigs injured by smoke and gas. Swain and Harkness report finding 0.0263 per cent. arsenic trioxide in plants that were grown 5 miles from a smelter. The effect of illuminating gas on the flowering of carnations was studied by Crocker and Knight, and they found that the injury was in proportion to the amount of ethylene in the gas, 1 part to 2,000,000 causing the flowers to close. Osterhout pointed out the resemblance between gas injury and the effect of drought on plants, and shows that the young leaves are the first to show the effects of gas, while the older ones are the first to suffer from drought.

Gager studied the effect of radium on plants at the New York Botanical Gardens, and found that while it had a retarding effect on germination, the later growth of many plants was stimulated. Guillemot got similar results with X-rays and radium. It had been considered that the vitality of seed could be estimated by the occurrence of peroxidase, and Brocq-Rousseau and Gain showed that peroxidase does not persist in seeds that are much over 20 years old and in many species for a less time. Priestly reported the stimulating effect of an overhead discharge of electricity on various plants, but he does not think it is associated with starch formation, as claimed by Pollacci.

PLANT PATHOLOGY. An international association was formed for the exchange of information regarding the suppression of fungus and insect plant pests. Life history studies of a number of

groups of fungi to determine the alternate host species, etc., were continued. Arthur showed by cultural studies, the possibility of connecting the scedial and uredo stages of a number of rusts. Olive made cytological studies of rust, and found that the change from a uninucleated to a binucleated form of cell is a stage in the sporophyte generation. Freeman and Ueberger have contributed the information that of the two sorghum smuts in the United States, the grain smut is by far the most prevalent and its occurrence may be prevented by soaking the seed before planting in a weak solution of formalin. The head smut appears confined to a portion of Texas. Hedgecock has shown the possibility of transferring the soft form of crown-gall of fruit trees and shrubs to many host plants. E. F. Smith successfully isolated the organism that causes the olive knot disease. Scott and Rorer investigated the leaf spot of apples and found it due, in a large measure, to *Sphaeropsis malorum*, a fungus that causes the black rot of the fruit. Eustace reported that most of the rotting of apples in cold storage is due to the mold *Penicillium glaucum*. Fumigation with sulphur destroyed the spores of other fungi but not the mold, and the commercial value of the fruit was impaired. Brooks investigated a fruit spot of apples, which, from its frequent occurrence on that variety, was often called the Baldwin spot, and finds it due to the fungus *Cylindrosporium pomi*. Spraying with Bordeaux mixture will prevent its appearance. Smith and Butler, of the California Agricultural Experiment Station, described a gum disease of citrus trees that appeared to be due to physiological disturbances. Wolf reported the occurrence in Nebraska of a fruit rot of grapes due to *Pestalozzia uvicola*, a fungus not hitherto reported in America. A dry rot of corn caused by *Diplodia zeæ* was reported by the station botanists in Illinois and Nebraska. It causes a premature ripening and shriveling of the grain and is responsible for considerable losses. In France during 1908 two unusual diseases were quite prevalent, an oak mildew and a leaf disease of fir trees. Neither disease is expected to prove destructive except in abnormal seasons. The presence of the American gooseberry mildew (*Sphaerotheca mors-uvæ*) and a new disease of potatoes, called black scab, due to *Chrysophlyctis endobiotica* have occasioned much uneasiness in England and Germany during the past year. Headden reports from Colorado a serious injury to fruit trees that is attributed to arsenical poisoning arising from accumulated arsenic from spraying for codling moth. The destructive chestnut tree disease (*Diaporthe parasitica*) seems to be spreading, according to Murrill, Sterling, and others, and Murrill failed to find the immunity of the Japanese chestnut reported by Metcalf. Jones reported the damping off of coniferous seedlings and says the trouble may be prevented by spraying the seed beds with formalin 5 or 6 days before seeding. Spaulding showed that spraying dilute sulphuric acid over the seed beds several days before seeding will reduce damping off. The treatment should be repeated several days after the seedlings come up. A number of investigators have reported biological races of species of fungi that are limited to definite host plants, but Reid, from study of the common mildew, *Erysiphe cichoracearum*, thinks there is some doubt of the existence of such specialized forms.

Progress was reported in the means for the

prevention of plant diseases. Scott and others showed the value of a lime-sulphur spray when applied for scale insects as a means for preventing apple scab. The efficiency of Bordeaux mixture for the prevention of potato diseases was shown by the New York State Experiment Station, where in coöperative experiments with farmers five sprayings gave increased net profits of \$17.07 per acre; and in Wisconsin, where as much as \$21.70 per acre increased profits were obtained through spraying. The control of smut of winter barley proved a difficult matter, but Heald found that if the seed grain were soaked for 4 hours in cold water and then for 5 minutes in water heated to 126° to 130° F. the smut would be destroyed without injury to the grain. In Germany it was found that after soaking the seed in cold water, running it through an air drying machine heated to about 145° F. would give similar results with barley, but the treatment was not as efficient for preventing wheat smut. Briggs has shown that the root rot of tobacco due to *Thielavia basicola* may be greatly reduced in the field by the use of fertilizers that will reduce the alkalinity of the soil.

BOURNE, EDWARD GAYLORD. An American historian, died on Feb. 24, 1908. He was born in Strykersville, N. Y., on June 24, 1860, graduated in 1883 at Yale, and was instructor in history and lecturer on political science there in 1886-89. In the latter year he became instructor of history, and in 1890 professor of that subject, at Adelbert College. He was appointed professor of history at Yale in 1895, and held that position at the time of his death. He became chairman of the Historical Manuscripts Commission, of the American Historical Association, in 1901. He published many critical papers on historical subjects, several of which are included in a volume, *Essays in Historical Criticism* (1901). These essays show painstaking research, and critical sifting of evidence, and one of them, *The Legend of Marcus Whitman*, discredits the importance of Whitman's celebrated ride across the continent from Oregon to Washington, and of his efforts to demonstrate to the government the value of the Oregon territory. Professor Bourne's other books include: *The History of the Surplus Revenue of 1837* (1885); *Historical Introduction to the Philippine Islands* (1903); *Spain in America* (1904); and *Discovery, Conquest and History of the Philippine Islands* (1907). He edited Wooley's *A Two Years' Journal of New York* (1902); Fournier's *Napoleon I.* (1903); Roscher's *Spanish Colonial System* (1904); and edited and translated *The Narrative of De Soto* (1904); *The Voyages of Champlain* (1905); and the *Narratives of Columbus and Cabot* (1906).

BOWDOIN COLLEGE. An institution of higher learning at Brunswick, Me., founded in 1794. The attendance in the autumn of 1908 was 428, which was the largest in the history of the college. During 1907-8 the alumni and friends of the college raised the sum of \$277,000, as an addition to the general fund. The college was admitted during the year to the benefits of the Carnegie foundation. The faculty numbers 57. The library contains 91,546 books. The productive funds of the college in 1908 were \$1,379,894 and the income \$91,396. The President is Dr. William Dewitt Hyde.

BOWLING. The American Bowling Congress held its eighth annual tournament at Cincinnati Feb. 9-23. The individual championship was won by A. Wingler of Chicago, who rolled

699 in three games. In the two-men team contest, Kiene and Chalmers of Chicago won with a score of 1,254 for three games. The five-men team championship was won by the Bonds of Columbus, Ohio, with a total of 2,927 pins. The all events (nine games) championship went to R. Crable of East Liverpool, Ohio, who rolled 1,910. In the second annual tournament of the National Bowling Association held at Rochester, N. Y., Mar. 2-14, the winners and scores were: Individual, Fred Schwartje, Brooklyn, 697; two-men team, McGuirk-Grady, Paterson, N. J., 1,318; five-men team, Brunswick, New York, 2,893; all events, Larry Erdman, Brooklyn, 1,956.

BOXING. The boxing championships of the Amateur Athletic Union were held at Boston, Mar. 24-25. The victors in the final bouts were: 105-pound class, Angus McDougall, Boston; 115-pound class, M. J. Carroll, New York; 125-pound class, Edward J. Walsh, New York; 135-pound class, J. Denning, New York; 145-pound class, William Rolfe, Boston; 158-pound class, Henry Hall, Boston; heavyweight class, Thomas Kennedy, New York. The important event of the year in pugilistic circles was the defeat of the heavyweight champion, Tommy Burns, by Jack Johnson (colored). The contest took place in Sydney, Australia, on Dec. 26, and was witnessed by 18,000 people. Johnson had the advantage in weight and height and would undoubtedly have knocked out Burns if the police had not stopped the fight in the fourteenth round.

BOYCOTT. The year 1908 was a memorable one for the development of the United States law on the boycott. The most important decision was that in the case of *Loewe vs. Lawlor et al.*, known as the Danbury Hatters' case. Loewe and Company, hat manufacturers of Danbury, Conn., brought suit against the United Hatters of North America to restrain the latter from prosecuting a boycott against the plaintiff's hats. The manufacturer declared an open shop, and discarded the use of the union label, whereupon his employees belonging to the Hatters' Union induced the latter to institute a boycott throughout the United States. The lack of unanimity of American courts as to the status of trade union activities was shown by the fact that, although the United States Circuit Court dismissed the complaint and was sustained by the Circuit Court of Appeals, the Supreme Court unanimously overruled both lower courts by finding in favor of the plaintiff. The latter contended that the boycott constituted a combination in restraint of trade and was therefore in violation of the Sherman Anti-Trust Law of 1890. The court's decision was based on sections 1, 2, and 7 of that Act. Section 1 declares "every contract combination in the form of a trust or otherwise, or conspiracy, in restraint of trade" to be illegal and fixes punishment for violation at not more than \$5,000 fine, or imprisonment for one year, or both. Section 2 forbids monopoly and fixes similar punishments. Section 7 provides that any person who is injured in his business through any act forbidden by this law may sue to recover three-fold damages. The court held that the tradeunion in exercising the boycott constituted a "combination in restraint of trade among the several States," in that it obstructed the free flow of commerce and restricted the right of the plaintiff to engage in business, by

trying to compel him to do business only in the way the union imposed. As the plaintiff was able to show losses aggregating \$80,000 as the result of the boycott, he was authorized to sue for \$240,000 damages.

The decision aroused the widest interest; and among trade unions, most intense opposition. The decision raised serious doubts as to the legality of labor unions themselves. It was at any rate made clear that the highest court in the land will not sustain a combination whose primary aim is the injury of the business of another party, even though the members of the combination will be helped. President Samuel Gompers, of the American Federation of Labor, said: "Every normal, peaceful activity of workers, individually and in association, may be construed as conspiracy in restraint of trade." He contended that labor is not a commodity, hence no trust in it could be formed; that so long as men are free they may dispose of their labor and their patronage as they see fit; and that what is legal for one man must be legal for many in association. Under his lead the trade unions sought redress through Congressional action amending the Sherman Act. See LABOR, AMERICAN FEDERATION OF.

In apparently direct contradiction to the decision of the Supreme Court in the Hatters' case, was that handed down June 1 by the Supreme Court of Montana in the case of *Lindsay and Company vs. Montana Federation of Labor et al.* Lindsay and Company, wholesale dealers in fruits and vegetables, had been declared "unfair" by the Miners' Union and Trades Assembly. This action was endorsed by the Montana Federation and a circular issued in which "all laboring men and those in sympathy with organized labor are requested not to patronize Lindsay and Co." The company secured an injunction nullifying this boycott, but the Supreme Court of the State vacated the injunction. It was clearly shown that the company's trade had suffered as a result of the boycott. The opinion of the court is worthy of considerable attention. The boycott was defined by quoting from an opinion of the Supreme Court of New York, as "the act of combination, in refusing to have business dealings with another until he removes or ameliorates conditions which are deemed inimical to the welfare of the members of the combination, or some of them, or grants concessions which are deemed to make for that purpose." A conspiracy was defined as "a combination of two or more persons by some concerted action to accomplish a criminal or unlawful purpose, or to accomplish a purpose, not in itself criminal or unlawful, by criminal or unlawful means." The court held that the company did not have a property right in the trade of any particular person; hence any one person may rightfully withdraw his patronage. "But," says the opinion, "there can be found running through our legal literature many remarkable statements that an act perfectly lawful when done by one person becomes by some sort of legerdemain criminal when done by two or more persons acting in concert, and this upon the theory that the concerted action amounts to a conspiracy. But with this doctrine we do not agree. If an individual is clothed with a right when acting alone, he does not lose such right merely by acting with others." Hence, "if the

defendants did not violate any legal right of the plaintiff in withdrawing their patronage, they cannot be enjoined from continuing the boycott in force, so long as the means employed to make the boycott effective are not illegal." The means adopted in this case was the publication of the circular above noted. The court held that such publication by one person or by an association was perfectly legal, being an exercise of the right of free speech and free press. President Gompers made much of this decision in his reply to President Roosevelt during the presidential campaign.

Congress having taken no action to amend the Sherman Act, the American Federation of Labor endeavored to induce the party conventions to declare in favor of an amendment to the Sherman Anti-Trust Law, exempting trade unions from its provisions. The Republican platform made no statement whatever on this point, but the Democratic platform contained the following declaration: "The expanding organization of industry makes it essential that there should be no abridgement of the right of wage earners and producers to organize for the protection of wages and the improvement of labor conditions, to the end that such labor organizations and their members should not be regarded as illegal combinations in restraint of trade." See **PRESIDENTIAL CAMPAIGN**.

For the events growing out of an attempt of the American Federation of Labor to boycott the Buck's Stove and Range Company, see **INJUNCTIONS and LABOR, AMERICAN FEDERATION OF**.

BRADLEY, WILLIAM O'CONNELL. An American politician, United States Senator (Republican) from Kentucky. He was born at Garrard, Ky., on Mar. 18, 1847, and was admitted to the bar in 1865. In 1870 he was elected prosecuting attorney and two years later was a presidential elector and an unsuccessful candidate for Congress. He was again a Congressional candidate in 1876, but was again defeated. From 1880 to 1904 he was delegate-at-large to each Republican National Convention, and in the Convention of 1888 was a prominent candidate for the vice-presidential nomination. He was four times the unsuccessful nominee of his party for the United States Senate, and in 1887 was defeated for Governor. In 1889 he was appointed minister to Korea, but declined. He was elected Governor in 1895, being the first Republican to hold that office. The following year he was endorsed for President by the Kentucky Republican Convention. On Feb. 2, 1908, he was chosen United States Senator, owing his election to the support of Democratic legislators, who refused to vote for their own candidate. His senatorial term will expire on March 3, 1915. See **KENTUCKY**.

BRANDY. See **LIQUORS, FERMENTED AND DISTILLED**.

BRAZIL, UNITED STATES OF. The largest republic of South America, consisting of twenty States and a Federal District. Area, 3,218,139 square miles, exclusive of the Acre territory (73,720 square miles). Population (1900), 17,371,069; in 1907 it was estimated at 19,910,646. The population of the Acre territory was estimated at 70,000. The population of the Federal District in 1906 was 811,443 (463,453 males and 347,990 females). The principal cities, with their populations, according to the

latest censuses or estimates, are as follows: Rio de Janeiro (1906), 628,041 (361,544 males and 266,497 females; São Paulo (1907), 274,000; Bahia, 230,000; Pernambuco, 120,000; Pará (Belém), 100,000; Porto Allegro, 80,000; Campinas (1907), 83,000; Santos, 73,500; Ribeirao Preto, 56,800; Jahn, 49,000. The number of arrivals at the ports of Brazil in 1907 was 239,256, and of departures 202,660, giving an excess of 36,596 for arrivals. In the latter part of 1907 the States of Rio de Janeiro and São Paulo contracted with the Japanese Emigration Company for the introduction of Japanese laborers to be employed on the coffee and rice plantations. Rice is usually harvested in March, while the coffee harvest begins in June, so that the same laborers may be employed in gathering both. The first party of 781 Japanese arrived in June, 1908.

MINING. Gold is worked in the States of Bahia and Minas Geraes; its export in 1906 amounted to 4,547,940 grams. Diamonds are mined in these two States as well as in others; their export in 1906 was valued at about \$300,000. Other precious stones are also found. Coal is mined in Rio Grande do Sul and Santa Catarina. It has been proven that a carboniferous vein extends from the southern part of São Paulo into Rio Grande do Sul. The greater part of the world's supply of monazite comes from Brazil. The deposits lie along the coast of Bahia and Espirito Santo, in the sand banks and dunes of the beaches. The gravel deposits along certain rivers of the interior are also being worked for monazite. Its export in 1907 amounted to 4,437 tons, against 4,352 tons in 1906. Bismuth was discovered near the city of Campo Alegre.

AGRICULTURE. The entries of coffee into Brazilian ports from all sources during the year ending June 30, 1908, amounted to 11,349,271 bags of 60 kilos each, against 20,409,180 during the preceding year—a reduction of 43.3 per cent. The shipments of coffee to foreign countries during 1907-8 amounted to 12,953,572 bags, against 11,470,116 bags in 1906-07. Of the total coffee export, the United States took 5,136,446 bags in 1907-08, against 6,310,452 bags in 1906-07. In pursuance of the valorization scheme, aiming at the government support of the coffee market, the government of São Paulo purchased some 8,000,000 bags of coffee and shipped them to Havre, Hamburg, Rotterdam, New York, Bremen, London, and Antwerp. It declared that it would sell its coffee holdings according to the requirements of the market, and that it was prepared to hold its purchases for years, if necessary. The object of the State government was to prevent a collapse in price as a result of the record crop of 1906-7. In this it succeeded, and fairly remunerative prices were maintained. The State government also entered into a contract with two British firms to conduct a coffee propaganda in Great Britain and its colonies in return for a subsidy of £50,000. The long pending negotiations for the £15,000,000 coffee loan, for the refunding of all previous coffee loans contracted by the State of São Paulo in connection with the coffee valorization plan, were consummated on Dec. 9, 1908. The loan was made on condition that no more coffee shall be bought by the government, and thus marks the end of valorization as a permanent policy. It was contracted by the State of São Paulo, but is guaranteed

by the Brazilian government. The bonds bear 5 per cent. interest, mature in 1919, unless called earlier, and were offered at 92½ simultaneously in New York, London, Paris, Berlin, and Brussels.

About one-sixth of the world's supply of cacao comes from Brazil, the crop of which for 1907 was estimated at 53,683,000 pounds, against 55,102,456 in 1906. The production of yerba maté in 1907 was 57,716,503 kilos (1 kilo = 2.205 lbs.), valued at 16,302,881 milreis (1 milreis = 30 cents). The export of rubber in 1906 amounted to 34,960,184 kilos, valued at 210,284,551 milreis, and in 1907, 36,489,772 kilos, valued at 217,504,288 milreis. In the latter year the United States took 16,811,251 kilos of Brazilian rubber; Great Britain, 14,353,634; France, 2,506,161, and Germany, 2,331,248 kilos. Brazil is a large producer of sugar, imports of which are kept out by a high protective duty. At the same time the price is raised for the domestic consumer by the sugar trust, which exports one-fourth of the crop in order to command a high price for the remainder. The cotton production in 1907 amounted to 370,000 bales of 500 pounds each. The *gravatá* plant, which abounds in the coast region of the States of Rio de Janeiro and Espirito Santo, is said to yield a fibre rivalling the henequen of Mexico. In the north of Rio de Janeiro it has been extracted on a small scale for many years, but recently companies were formed for its cultivation and extraction on a large scale. The *hebisco*, another fibre plant, grows wild in the valley of the San Francisco river, in the northern States. The export of Brazil nuts in 1908 was 165,921 hectolitres (2.84 U. S. bushels each), of which 89,898 went to the United States.

STOCK-RAISING AND DAIRYING. The greatest obstacle to the development of stock-raising is the lack of means of transportation. Nevertheless the State of Matto Grosso is supposed to have not less than 3,000,000 cattle, and Goyaz slightly less. In the former State there are ranches many hundreds of miles in extent, with herds of from 120,000 to 200,000 head. In the States of Minas Geraes, São Paulo, and Rio de Janeiro well-established dairies have been successfully operating for some years, and the product of these is constantly increasing. Minas Geraes in 1907 was the largest producer of dairy products. Its export of dairy products to other States in 1907 were as follows: Milk, 11,221,400 pounds; cheese, 10,195,900 pounds; butter, 3,136,900 pounds. The greater part of these products was consumed in the large cities of the States of Rio de Janeiro and São Paulo. The State of Rio de Janeiro is now furnishing these cities an almost equal amount of milk and butter, but very much less cheese.

MANUFACTURES. In 1907 the total number of industrial establishments of every description was 2,292, with 123,931 employees, \$162,818,700 of invested capital, and an annual production of \$186,633,000. Included in these were 137 cotton factories, with 41,018 employees, \$59,682,900 of invested capital, and an annual production of 251,119,600 metres of cloth. Of the total capital invested in Brazilian establishments, over 36 per cent. was represented by cotton factories. There were five large establishments for the manufacture of the immense number of coffee bags needed for

the yearly crop, and this industry is protected by a high duty. These factories have as yet only looms and buy their jute yarns abroad, mainly in Dundee, Scotland. In 1907 the mills turned out 172,797 metric tons of flour, against 162,147 tons in 1906, showing an increase of 6.5 per cent. At the same time the consumption of flour increased from 316,093 metric tons in 1906 to 343,050 tons in 1907, showing an increase of 8.5 per cent; and the importation of flour increased from 153,946 tons in 1906 to 170,253 tons in 1907—showing an increase of 10.6 per cent. Argentina furnishes three-fourths of the flour imports, and nearly the whole of the wheat ground in Brazilian mills.

FOREIGN COMMERCE. In 1907 the total imports were valued at \$197,261,840 (on the basis of 30 cents to the milreis), against \$161,039,600 in 1906, and the exports, \$263,749,204, against \$257,338,500 in 1906. In milreis the imports were valued at 644,937,744 and the exports at 861,134,736. By great classes, the imports were as follows, in milreis: Live stock, 2,691,748; raw materials, 128,723,225; manufactures, 340,419,554; foodstuffs and fodder, 173,103,217. The leading imports in 1907 were as follows, in milreis: Jute and hemp yarn, 12,695,265; coal, 32,800,698; cotton goods and wearing apparel, 61,158,422; woolen goods, 9,551,790; tubes, pipes, etc., 11,819,710; iron and steel and manufactures thereof, 74,278,612; industrial machinery, 7,649,970; implements and tools, 7,089,480; locomotives, 5,124,463; kerosene oil, 11,410,517; codfish, 13,976,541; wheat flour, 31,696,204; wheat, 26,686,512; jerked beef, 17,345,162; wines, 31,320,589. The leading exports in 1907 were, in milreis: Hides, dry and tanned, 27,373,643; skins, 11,432,815; monazite sand, 1,598,088; manganese, 8,009,785; gold, 6,521,962; raw cotton, 27,499,919; rubber, 217,504,288; cacao, 32,043,979; coffee in the bean, 453,764,571; maté, 25,619,177; leaf tobacco, 20,050,817. The trade with the leading countries of origin and destination was in 1907 as follows:

From and to	Imports	Exports
Germany	\$30,221,171	\$45,084,631
Austria-Hungary	3,296,324	7,425,934
Belgium	7,822,136	14,240,398
France	18,009,320	35,020,373
Netherlands	1,116,930	10,383,487
Italy	6,976,230	1,531,614
Portugal	11,447,385	1,824,186
Great Britain	59,073,835	42,077,661
United States	25,139,390	84,721,265
Uruguay	5,476,962	3,616,205
Argentina	17,645,245	8,562,137

Compared with 1906, the imports from Germany increased 27.6 per cent.; from Great Britain, 30.8 per cent.; and from the United States, 35.9 per cent. At the same time the exports to Germany increased 7.0 per cent.; to Great Britain, 1.3 per cent.; and to the United States, 6.4 per cent.

SHIPPING AND NAVIGATION. In 1907 the merchant marine, comprising vessels of 100 tons and over, consisted of 283 steamers, of 119,930 net tons, and 78 sailing vessels, of 19,597 net tons. The ports were entered in 1906 by 17,764 vessels of 14,464,937 tons, of which 13,430 vessels, of 5,579,896 tons, were Brazilian.

INTERNAL COMMUNICATIONS. The total railway mileage at the end of 1908 was 11,572 miles, of which 5,572 miles were owned by the State and Federal governments, and about 6,000 miles by private companies. On Jan. 1, 1908, the length of railways under construction was about 2,060 miles, while plans had been approved for 4,150 miles. During the year 1907 about 435 miles were added in various parts of the country, and in 1908 633 miles, the largest amount in any single year. Arrangements were being made in the middle of 1908 for the immediate construction of the railway connecting the present governmental system in São Paulo with the Bolivian frontier at Corumba. The contract called for the completion of the 685 miles of the road in thirty months. Work was to be pushed from both terminals, and it was expected that by March, 1909, the road starting from Bauru, in São Paulo would reach Itapura, on the Parana. The entire work is to be done by the French syndicate which has been prosecuting the work in São Paulo for the past year. This line will form an important link in the projected Pan-American railway. The length of telegraphs was 25,927 miles, of which 490 miles were added during the year. More than one-half of this addition was on the line which is to connect the Acre territory and Amazonas with Matto Grosso and other States. A highway to connect the seats of the three administrative divisions into which the Acre territory has been divided—Alto Jurua, Alto Purus, and Alto Acre—was to have been completed by the end of 1908. It was built with a view to the running of a line of automobiles between these three points. It was calculated that the trip between Alto Jurua and Alto Purus would be made by automobiles in fifteen days, and from Alto Purus to Alto Acre in two days.

BANKS AND MONEY. The Bank of Brazil has a capital stock of 70,000,000 milreis, the government holding one-third of its shares. In accordance with the law of Nov. 28, 1907, the government has established the Agricultural Bank, with a capital of 30,000,000 milreis. There are five so-called foreign banks doing business in Rio de Janeiro. They are the London and River Plate Bank, with a subscribed capital of £2,000,000, a paid-up capital of £1,200,000, and a reserve fund of £1,200,000; the London and Brazilian Bank, with a capital of £2,000,000, a paid-up capital of £1,000,000, and a reserve of £910,000; the British Bank of South America, with a capital of £1,300,000, a paid-up capital of £650,000, and a reserve fund of \$535,000; the Brazilianische Bank für Deutschland, with a realized capital of 10,000,000 marks; and the Banco Commerciale Italo-Brasiliiano, with a paid-up capital of 5,000,000 milreis, and a reserve of 1,000,000 milreis, the last named being organized in Brazil, but owned largely in Italy.

There is little metallic money in circulation. The total amount of gold coined from 1903 to 1907 inclusive was 114,600 milreis in gold and 9,054,158 milreis in silver. This is practically all the coin in circulation. The Caixa de Conversao, or exchange bureau, has issued since its organization on Dec. 21, 1906, a total of 98,350,120 milreis. This money is exchangeable for gold at the rate of 30 cents to the milreis, and is issued against gold in the Brazilian treasury. The amount of inconvertible paper money in circulation has been reduced in recent years; on Feb. 29, 1908, it amounted to 642,963,951 milreis, against 788,351,614 on Aug. 31, 1898. The gold milreis is equal to 54.6 cents.

FINANCE. The revenue of the Republic for 1907 consisted of 100,605,000 milreis gold, and 317,930,000 milreis paper; the expenditure of 59,701,000 milreis gold, and 352,983,000 milreis paper. The approved budget for 1903 estimated the total revenue at 75,279,380 milreis gold, and 258,979,900 milreis paper, and fixed the expenditure at 65,625,605 milreis gold, and 329,470,857 milreis paper. The following are the principal sources of revenue according to the estimates:

	Gold	National paper
	<i>Milreis.</i>	<i>Milreis.</i>
Import duties	72,100,000	120,550,000
20 per cent. of the export duties of the Acre territory		18,006,000
Internal revenues	1,514,006	70,994,000
Excise taxes		38,155,000
Extraordinary revenues	1,214,714	10,000,000

The expenditures are distributed as follows:

	Gold.	National paper.
	<i>Milreis.</i>	<i>Milreis.</i>
Department of Justice and the Interior.....	10,700,000	35,267,250
Department of Foreign Relations	2,406,400	1,809,800
Navy Department	8,541,062	36,006,256
War Department	110,000	59,817,173
Department of Industry, Ways, and Public Works	9,155,561	88,223,188
Treasury Department ..	29,186,849	89,848,818

The budget for 1909 estimated the ordinary revenues at 79,694,198 gold and 274,238,000 paper milreis; the ordinary expenditures at 75,390,272 gold and 330,352,781 paper milreis. The consolidated foreign debt of Brazil on Dec. 31, 1907, stood at £72,133,457; the internal debt amounted on Mar. 31, 1907, to 552,476,592 milreis; the floating debt on Mar. 31, 1907, to 277,037,604 milreis; and the paper money in circulation on Dec. 31, 1907, was 643,531,727 milreis.

ARMY. A law was passed in Jan., 1908, reorganizing the army and making military service obligatory on all citizens between the ages of twenty-one and forty-four years. The period of service is divided as follows: 1st line: nine years, two in the ranks and seven in the reserve; 2nd line: seven years, three in the first ban and four in the second; 3rd line: eight years, four in the national guard and four in the reserve. The effect of this law remains to be seen, but the strength of the army at the time of its adoption while supposed to be about 28,000 men was in reality only about half that number. The army consisted of 40 battalions of infantry, 14 regiments of cavalry, 6 battalions of coast artillery, 6 regiments of horse artillery, and 2 battalions of engineers, together with some auxiliary troops including rural guards (gendarmierie) to the number of 20,000. The War Minister announced that within a decade Brazil would have nearly 500,000 men on a war footing.

NAVY. The navy consisted, at the beginning of 1908, of 1 battleship, third class, 5,800 tons; 2 armored coast defense ships, 6,400 tons; 7 protected small cruisers, 15,120 tons; 1 gunboat, 800 tons; 1 destroyer, 600 tons; and 8 torpedo

boats, 1,100 tons, giving a total of 20 ships, of 29,920 tons. The personnel numbered about 3,700. The programme of naval construction, in process of execution, in 1908, included 3 battleships of the "Dreadnought" type of 19,250 tons each, which were building in England at a cost of \$9,000,000 each; 3 scout cruisers of 3,500 tons each, at a cost of \$1,350,000 apiece; 18 destroyers of 600 tons each, at a cost of \$325,000 apiece; 1 mine layer of 3,000 tons, to cost \$750,000; besides a few submarine and torpedo boats. The total tonnage will be 80,000, and the aggregate cost, \$39,500,000.

In addition to the battleships there were under construction in England: 2 scout cruisers, 10 destroyers, 10 sea going torpedo boats, and 5 submarines. Newspaper rumors, without foundation, were widely circulated that the battleships were to be sold to Japan, or to Great Britain.

HISTORY. On Jan. 13, 1908, President Penna decreed the reduction of the tariff duties on several United States products, in return for the favor shown by the United States to Brazilian coffee, and by way of celebrating the visit of the American fleet. The fleet arrived at Rio Janeiro on Jan. 14. A national exhibition was held in the last six months of 1908, which, according to the president, was intended as "an opportunity for foreigners to judge adequately concerning the salubrity of the climate and the natural wealth of the country, as well as the progressive character of its industries." Permission was accorded to the United States to make an exhibit of agricultural implements, and it was arranged that a Brazilian-American permanent sample-exposition should be established for the display of such articles as American manufacturers desired to introduce to the Brazilian markets. It was made a national rather than an international exposition, to celebrate the one hundredth anniversary of the opening of the Brazilian ports. Its site comprised more than 500 acres, and the main building covered an area of 38,750 square feet. Portugal was the only foreign nation invited to participate, this exception being made because of the ancestral relation between the two countries.

Japanese immigration under the new arrangement between the Japanese and Brazilian governments began in June. The first arrivals were in a short period of time distributed among the coffee plantations in the State of São Paulo. This marked the first stage of a scheme for Japanese colonization. An agreement concluded late in 1908 between the Brazilian government and the Imperial Emigration Company of Tokio provided that 3,000 Japanese colonists between the ages of twelve and forty-five, and of sound health, should be brought over within two years at the cost of the Brazilian government. At the same time the policy of encouraging white immigration was continued, free passage and a homestead being guaranteed to bona fide settlers from Europe. The ultimate aim of the government is to build up a class of peasant proprietors who shall be at the same time available for labor on the great coffee plantations. Under the present system of hired plantation labor, the field hands are accustomed to migrate in hordes from place to place, leading to violent fluctuations in the labor market and depriving the country of the advantages that come from a land-owning and stable population.

The treaty between Brazil and Holland, fixing the boundary lines of Dutch Guiana, was

ratified Sept. 15, 1908. The treaty dates from May 5, 1906, and provides for a mixed commission appointed by the two governments which shall determine the lines; any controversy arising during their deliberations to be submitted to the Permanent Court of Arbitration at the Hague. A general arbitration treaty between Brazil and Argentina, dating from Sept. 7, 1905, was ratified by Brazil Oct. 1, 1908, and the exchange of ratifications took place on Dec. 5, 1908, when the treaty went into force. In spite of this agreement the competition in increased armaments which Brazil has entered against Argentina (q. v.) showed no signs of abating. On Sept. 10 the new Brazilian battleship, the *Minas Geraes*, regarded as the most powerful warship afloat, was launched at Newcastle-on-Tyne. A second vessel of the same type was then nearing completion and the construction of a third battleship was begun.

BREAKWATERS. A breakwater nearing completion in 1908 and possessing some novel features, was being built by the United States government in connection with the formation of a small harbor at Algoma, Wis., on the west shore of Lake Michigan. Five hundred feet of reinforced concrete caissons were to be used on that portion of the wall most exposed to the action of the waves. The caissons were, in effect, great reinforced concrete boxes which, made on shore, were floated into position, sunk until resting upon a pile foundation, and then filled with rip-rap floated in thin mortar. Upon this the superstructure, monolithic in form, was built, while large stones were placed against the toe on both the harbor and lake sides of the wall, to prevent scouring.

BREEDING OF ANIMALS. See STOCK RAISING.

BREEDING OF PLANTS. See BOTANY.

BRETHREN, CHURCH OF THE, also known as **DUNKERS** or **DUNKARDS**. A considerable body of Christians, whose faith and practice are not generally known outside of the localities in which they live. They originated at Schwarzenau, Germany, in 1708, with Alexander Mack as their leader. Persecution drove them to this country, and their first settlement was at Germantown, Pa., in 1719. They recognize the New Testament as their rule of conduct, believe in the Trinity, hold faith, repentance, and baptism by triple immersion as conditions of pardon and membership. They observe foot-washing as a religious rite, followed by an evening meal, which they call the Lord's Supper. The Eucharist is a separate service, following the supper. Their mode of greeting is the kiss of love. They take no part in war, dress plainly, live simple, industrious lives, and are generally well-to-do. There are three groups of them,—the Conservatives, Progressives, and Old Orders. The Conservatives are the most numerous and number about 100,000, having 870 congregations, 2,938 ministers, 10 colleges, and one of the largest denominational printing plants in the West, known as the Brethren Publishing House, located at Elgin, Ill. The *Gospel Messenger*, a large religious weekly, is their organ. At their publishing house in Elgin a number of other publications are issued. The Brethren have missions in Denmark, Sweden, France, Switzerland, Asia Minor, India, and China. The latter was open-

ed in the fall of 1908. At their General Conference, held at Des Moines, Iowa, June, 1908, they celebrated their Bicentennial, and also changed the name of their organization from "German Baptist Brethren" to "Church of the Brethren." "Dunker" is a nickname that they do not recognize. Their next General Conference is to be held at Harrisonburg, Va., beginning June 1, 1909. The Progressive Brethren number about 17,000 and the Old Order Brethren, 4,000. The former have a college and a publishing house at Ashland, Ohio. There are settlements of the Brethren—as they always call themselves—in nearly all of the northern and western States. In some of the eastern and middle States, they are quite numerous. The small body known as Seventh Day German Baptists is now nearly extinct. There are only a few members left, and these live in the vicinity of Ephrata, Pa.

BRIDGES. Two new bridges over the Rhine at Cologne were being built during 1908. The smaller, and the southerly one, which is to carry two railway tracks and two cantilevered footwalks, consists of two arched trusses, spaced 26 feet apart in the clear, and provides for a 150 metre (492.12 feet) clear span at the centre of the channel, with a 30 metre (98.43 feet) clearance at high water, and side channel spans of 90 metres (295.27 feet) and 40 metres (131.23 feet). Three steel arch-truss spans over the river part, two of 333 feet each and one of 541 feet, and three true arch spans on the right bank of 183.7 feet each, will be employed, the former being through arches with both chords rising above the roadway, while the latter are of the deck type. A total of 5,500 tons of steel will be required, and the cost is estimated at \$1,250,000, including in this both the approaches and the foundations. It was to have been completed by 1911, but the failure of the 200-foot steel erection truss, by which 8 lives were lost, was expected to cause some delay. The wrecked truss was part of the centering for the 541-foot arch span, the centering on each side consisting of pile trestle, and was erected so as to provide a free channel 200 feet wide for vessels bound up stream, while a similar opening in another part of the structure was left for those bound down.

The northerly bridge is considerably heavier, being designed to carry four railway tracks, two trolley lines, two roadways, and two sidewalks on the same deck, and will occupy, when completed, the site of the present double bridge which it is intended to replace. As the old bridge must be kept in service till the new one is finished, the latter is constructed as three adjoining but independent trusses, seated on new piers which carry all three structures and which do not interfere with the old piers. The general arrangement is similar to the other. It consists of three spans, 390 feet, 550.2 feet, and 402 feet centre to centre, with masonry approaches, and small arches crossing the streets. The trusses in this are also arched, but the arches of the successive spans are independent, and are visibly separated by masonry towers surrounding the piers, whereas in the other they are riveted together end to end, so as to form a continuous structure, and lack the stone intermediate towers. The three parts have the following widths—: each of the two double track railway bridges is 26 feet in the clear between trusses, while the highway bridge is 36.5 feet, with a ten foot cantilevered sidewalk on

the free side, and an eight foot cantilevered walk on the other. Each is distinct in all its parts even to the end shoes, the piers alone being common to all.

PROPOSED HUDSON RIVER BRIDGE. The plan to span the Hudson River between New York City and the Jersey shore again received some attention in 1908, the proposition then put forward being for a bridge located at about 181st street, New York. For this site a 1,400 foot cantilever truss was suggested, to span the channel near the east shore where the river is deepest, with three 640 foot simple spans in the shallower part on the Jersey side.

QUEENSBORO BRIDGE. The erection of the superstructure of the Blackwells Island (the name of which was changed by a city ordinance to "Queensboro") Bridge, was completed June 15, 1908, so that the only remaining work consisted of some masonry to be laid at the main and anchor piers, which was finished by the end of the year. Due to articles in the daily press questioning the stability of the bridge, a commission was appointed by Mayor McClellan to examine the structure and report upon it. This commission consisted of Prof. Wm. H. Burr of Columbia University and Messrs. Boller and Hodge. Two separate investigations were involved, one by Professor Burr, who, with the forces of the Bridge Department of the City, recomputed the stresses in the structure, and the other by Messrs. Boller and Hodge, who undertook a similar but entirely independent examination.

Both reports discussed the design and construction of the bridge, and the conclusions reached were in substantial harmony. Professor Burr in his report said that "Computations for all the main truss members of the bridge show that the stress produced by the prescribed congested live load combined with the dead loads or with the dead load and wind loading are higher than prescribed as permissible in the specifications, and higher than prudent to permit, although practically not in excess of the limits approved by the Commission of Expert Engineers in 1903. The stresses disclosed by the stress sheet submitted with this report show that a controlled traffic on the four trolley lines of the lower deck and on two elevated railways of the upper deck carrying the heaviest cars of their classes now in use in the City of New York, together with a vehicular traffic on the roadway and two loaded sidewalks, may be permitted without exceeding the specified unit stresses for the regular live load and dead load, and without exceeding the safe limits of stresses for such a structure, provided the rearrangement of the floor of the lower deck and the removal of the two elevated railway tracks on the upper deck, together with the rearrangement of the sidewalk details be made as indicated in this report, so as to reduce the dead load by at least 1,172 lbs. per lin. ft. of each truss of the cantilever arms and 380 lbs. per lin. ft. of each truss of the island span and anchor arms. This rearrangement and reduction of dead load can now be made without material delay in the opening of the bridge for traffic. The capacity so afforded is satisfactory and sufficient for a considerable future period. Any further use of the upper deck for elevated railway or other purposes should be deferred until the development of traffic in the future may make it necessary, and until it shall be determined what character of traffic must then be accommodated, but that adjustment to the future

THE QUEENSBORO BRIDGE CONNECTING THE BOROUGH OF QUEENS AND MANHATTAN

View from the Manhattan Shore

traffic should not be such as to produce greater unit stresses than those approved in this report."

Messrs. Boller and Hodge reported that the structure, in their opinion, was perfectly safe if certain recommendations submitted with their report were carried out. These recommendations were as follows: (1) That the stringers of the two inside tracks on the upper decks, or other equivalent dead load, be removed to lighten the dead load. (2) That the trolley traffic be so regulated that if four tracks are in use the cars shall not run with clear intervals between them of less than their own length. (3) That the bridge be opened for the traffic of the sidewalks, highway, and four lines of trolley tracks as at present constructed, subject to the above recommendations. (4) That if any other moving loads be added to the structure, such further modifications of the dead load shall first be made as will keep the total direct stresses caused by the live and dead loads within the safe limits herein set."

The bridge and the reports referred to above attracted much attention from engineers during the year, and in view of the failure of the Quebec Bridge seemed to indicate that greater care must be taken in the design of large structures of this kind, not only to insure their absolute safety, but to prevent modification in designs once adopted and the criticism of plans by engineers.

MANHATTAN BRIDGE. The steel towers of the Manhattan Bridge, New York City, the material of which was fabricated by the Phoenix Bridge Company and erected by Terry & Tench, were completed in May, 1908. Each tower is composed of four columns of rectangular section, one leg being under each cable, braced together transversely to the axis of the bridge. The maximum intensity of pressure which they transmit through the pedestals to the pier is 64,000 lbs. per square foot, while the pedestals themselves, one under each column, weigh 191 tons apiece and 205 tons with the base plates attached. The construction of the footwalks was begun by swinging 1¾ inch cables between the towers on June 15. Sixteen of these, used in groups of fours, were needed upon which to erect the two footwalks, and from each of which latter the spinning of the four main cables will be done. The first crossing over the footwalks was made July 13. The main cables, which during the year were being spun, consist of 9,472 wires each of No. 6 Birmingham gauge, and the method employed was similar to that adopted on the Williamsburg structure. Like those of the Brooklyn Bridge the cables will have the roadway hung from them throughout the entire length, and will be required to carry a dead load of 25,000 lbs. per lineal foot in addition to the live load. The approach sites were cleared and the foundations for the approach viaducts were being completed.

BROOKLYN BRIDGE. The railroad floor of the Brooklyn Bridge was reinforced during the year by substituting steel eye beams for the wooden stringers formerly used. The shuttle train service over the bridge connecting with the Brooklyn Elevated lines, and hitherto substituted for through traffic during rush hours, was abandoned and the cable haulage system, in use for twenty-four years, was entirely removed, since the tail switching extension at the Manhattan end began operations on Jan. 26, 1908. Through trains, handling about half a million people

daily, were run to their destination over the different lines of the Brooklyn Elevated Railroad, thus avoiding change of cars at the Brooklyn end, while the local traffic was carried by the trolley cars on the roadway during rush hours; six car trains are operated under a sixty second headway.

WILLIAMSBURG BRIDGE. The Williamsburg bridge was being strengthened in the supports of the stiffening trusses, to permit of subway cars being operated over it, and in addition to this an underground trolley loop was opened at the Manhattan end on May 19th. Cars were run from Manhattan and Brooklyn on separate tracks, the former turning on the Brooklyn side and the latter on the Manhattan side, thus reducing the interchange of passengers at the ends of the bridge. The Manhattan loop was to serve later as a terminal for a connecting subway between the Manhattan ends of the Brooklyn and Williamsburg Bridges, operating Brooklyn Elevated Railroad trains.

CONCRETE ARCH BRIDGE. The largest concrete arch bridge in the world is to be built at Columbus, Ohio, to carry Detroit Avenue across Rockery River. It will be about 708 feet long, with a central arch of 280 feet span, and will have a 40 foot roadway and two 8 foot sidewalks.

FAILURE OF SUSQUEHANNA BRIDGE. The most northerly span of the new Baltimore & Ohio Railroad bridge over the Susquehanna River, while under construction, failed on Sept. 23, 1908, under a train load of coal gondola cars. The entire framework of the structure, including a timber and steel false work, a partially erected truss, the old floor system, and a 300 ton traveller, was precipitated into the river. The bridge, which was a double track structure, composed of plate girders, deck and through trusses, was located about one mile above Havre-de-Grace, Md., on the river, and was intended to replace the older one built in 1884-5.

REPORT ON THE QUEBEC BRIDGE FAILURE. The report of the commission appointed by the Canadian government to investigate the cause of the failure of the Quebec Bridge was made public in the early part of 1908. A new commission was named during the year, at the suggestion of the Dominion Department of Railways and Canals, to report upon the questions of location, design, etc., for a bridge to replace the old one. This is composed of Mr. Maurice Fitzmaurice of London, Mr. Ralph Mojeski of Chicago, and Mr. H. E. Vantelet of Montreal. Should a new structure be authorized, it will be undertaken as a government enterprise.

BASCULE BRIDGE. The new bascule draw bridge of the Chicago Northwestern Railroad, the first of two similar structures to be completed, and crossing the north branch of the Chicago River at the Wells Street terminus, Chicago, was the longest, largest, and heaviest single leaf, double-track bridge in the world at the time of its erection. It is of the Strauss trunnion type, has a span of 170 feet, and a clear span of 140 feet, an overhead counter weight weighing 1200 tons, and was designed to accommodate 260 trains daily, and be opened 1000 times a month for river traffic. It was to replace the old double track centre pier swing bridge, is operated by two 50 H.P. motors and can be swung in one minute.

THE VISTULA BRIDGE. The large double track railway bridge over the Vistula River, in West

Prussia, Germany, begun in 1905, was nearing completion. At the point where it crosses, the river is 5,000 feet wide, but to shorten the distance one of the levees was moved 1525 feet. The structure consists of ten spans, five of which have parallel chords and are 256 feet centre to centre end supports, while the other five have broken upper chords and are 426½ feet. The clear width of roadway is 37 feet part of which is used as a highway and part for two railway tracks. Thirteen thousand tons of steel will be used in the structure and it will cost \$2,000,000.

BRITISH ACADEMY. A learned society, incorporated by Royal charter in 1902. The official title is the British Academy for the Promotion of Historical, Philosophical, and Philological Studies. In 1908 there were 94 ordinary Fellows; the maximum number is 100. These are distributed in four main sections or committees: History and Archaeology, Chairman, Lord Reay; Philology, Chairman, S. H. Butcher; Philosophy, Chairman, Professor James Ward; Jurisprudence and Economics, Chairman, Sir W. R. Anson; President of the Society in 1908, Sir E. Maunde Thompson, K. C. B.; Secretary, Professor I. Gollancz.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE. See ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, BRITISH.

BRITISH CENTRAL AFRICA PROTECTORATE. See NYASSALAND.

BRITISH COLUMBIA. A province of Canada. Area, 312,630 square miles. Population in 1901, 178,657, including 28,949 Indians and half-breeds, and 19,482 Chinese and Japanese. Victoria, the capital, had 20,816 inhabitants in 1901. For details respecting population, education, production, commerce, etc. See CANADA. The provincial government consists of a Lieutenant-Governor, appointed by the Governor-General of Canada and acting through an executive Council or responsible Ministry. The unicameral Legislative Assembly consists of 42 members. The present Lieutenant-Governor is James Dunsmuir, appointed May 11, 1906. The Premier is Richard McBride.

HISTORY. The disturbance over the immigration of Orientals which had marked the year 1907 continued during the first part of 1908. The attitude of the government toward the Asiatics occasioned much discussion and was regarded by many as arbitrary and indefensible. In March a number of East Indians who had been sentenced to a year's imprisonment under the Natal Act were released by order of the Supreme Court on the ground that the Act was unconstitutional. On March 21 a mass meeting was held at Vancouver, and a resolution passed demanding the withdrawal of the immigrant clause of the Japanese Treaty, and the exclusion of the Japanese if they violated the Lemieux agreement. It was also resolved that a bill should be passed by the Legislature excluding East Indians, if the Imperial government did not prevent their immigration into Canada from India and the British possessions. The population manifested strong disapproval of the Canadian government's attitude toward the whole question of Asiatic immigration. (See CANADA.) The year was marked by a very serious calamity owing to forest fires in the Kootenay Valley. Six towns, including Fernie and neighboring towns, were destroyed by fire in

August, with a loss estimated at about \$20,000,000. The new town of Prince Rupert, the terminus of the Grand Trunk Pacific Railway, made rapid progress during the year, owing chiefly to the settlement of a dispute between the Province and the railway, by which the latter in August obtained 17,000 feet of water front, amply sufficient for terminal facilities. Building at once became active. The Province also agreed to assist financially in opening up the Revelstoke route for both winter and summer, thus facilitating the bringing in of supplies for the construction of the Grand Trunk Pacific Railway.

BRITISH EAST AFRICA PROTECTORATE. A British possession extending from Abyssinia and Italian Somaliland on the north to German East Africa on the south, and inland as far as Uganda. Area, 177,100 square miles. Population in 1905, 4,038,256, including 25,000 Asiatics and 2,000 Europeans and Eurasians. Nairobi, the capital of the Protectorate, has 13,500 inhabitants (600 Europeans and 3,100 East Indians). The chief port is Mombasa, 30,000 inhabitants (200 Europeans), connected with the mainland by a railway bridge 1,732 feet in length. Rust-resisting varieties of wheat have been introduced and have proved to be well adapted to the soil and climatic conditions of the uplands. The area under maize, which is cultivated by natives as well as settlers, has been greatly extended. Rice, barley, coffee, and tobacco have also been introduced. Rubber plantations have been started. Large areas, particularly on the coast and in the lake districts, are admirably adapted for the cultivation of cotton, and experiments with different varieties of cotton were being conducted in various districts. During the year ending Mar. 31, 1908, there were exported 79,856 pounds of cotton. Sheep, both native and imported, thrive well in the splendid grazing areas in the uplands. The indigenous breeds of sheep and cattle have been improved, and wool-bearing sheep have been introduced. There is green herbage during the greater part of the year, and the prospects for an extensive dairy industry are excellent. Pigs are numerous. Ostriches have been domesticated. Horses and mules have been imported. The chief imports are cotton goods, rice, grain and flour, liquors, and building materials. The chief exports are ivory, copra, rubber, wax, hides, and skins. In 1907-08 the imports were valued at £799,117 and the exports at £515,052, against £765,407 and £440,705 respectively in 1906-07. The Uganda Railway, 584 miles long, from Mombasa to Port Florence, on the northeast corner of Lake Victoria Nyanza, is owned and worked by the Protectorate. Steamers on the lake are operated in connection with the railway. The length of telegraph lines is over 1,000 miles. The administration was placed in 1907 in the hands of a Governor. The revenue and expenditure for 1907-08 were estimated at £547,392 and £781,569 respectively, and the Imperial grant-in-aid at £153,000. The military force consists of 1,100 officers and men. The Governor in 1908 was Sir J. Hayes Sadler.

HISTORY. In Feb., 1908, a punitive expedition was led against the Kisii, who had risen against the authorities and committed murders and other atrocities. About 160 of the native insurgents were killed and wounded and many of their cattle were taken. The British losses were

slight. On Feb. 6, the tribesmen surrendered. In March there were public demonstrations of the discontent of the white settlers, and the new land bill was severely criticised. Towards the end of the year the criticisms directed against the Protectorate government culminated in England in a demand for the complete reorganization of the Colony. European officials had been charged with odious conduct in regard to native women, and native discontent was greatly stirred thereby.

BRITISH GUIANA. A colony of Great Britain, on the northeast coast of South America. Area, about 90,277 square miles. The last census, taken in 1891, showed a population of 278,328, consisting of 115,588 negroes, 105,463 East Indians, 3,714 Chinese, 7,463 aborigines, 29,629 mixed, and 16,724 Europeans. In 1906 the population was estimated at 300,131. Georgetown, the capital, had 53,176 inhabitants in 1891. In 1906-7 there arrived 2,257 Indian coolies, while 1,410 left. In the same year there were 220 government-aided schools, with 29,407 pupils. There are 45 sugar estates, comprising 72,390 acres. The sugar output in 1907-8 was 98,000 tons; for 1908-9 it was estimated at 100,000 tons. The output of gold has been declining; in 1906-7 it was 86,125 ounces. The export of diamonds in the same year was 4,113 carats, valued at £6,797. The imports and exports in 1906-7 were valued at £1,690,804 and £1,843,107 respectively. The principal imports in 1906-7 were: Flour, £154,467; textile fabrics, £262,094; machinery, £72,594; manures, £143,064; fish, £71,259; hardware, cutlery, and tools, £78,151; pickled beef and pork, £60,735. The principal domestic exports in 1906-7 were: Sugar, £1,059,503; rum, £108,460; balata, £50,106; gold, £313,222. Imports to and exports from Great Britain in 1906-7 were valued at £921,684 and £802,163 respectively; British colonies, £170,663 and £517,482. There were over 94 miles of railway and 560 miles of telegraphs and cables. The colony is administered by a Governor, assisted by an executive council, a legislative council or Court of Policy, which is partly representative, and a Combined Court, which deals exclusively with financial matters. The suffrage for the elective members of the Court of Policy and Combined Court is restricted. The Governor in 1908 was Sir F. M. Hodgson. The revenue and expenditure in 1906-7 were £535,745 and £514,053 respectively. The public debt stood on March 31, 1907, at £907,720. In September the Legislature revised the tariff, admitting into it the principle of preferential treatment for Great Britain and other parts of the British Empire.

BRITISH HONDURAS. A British Crown colony in Central America. Area, 7,562 square miles. Population (1901), 37,479; estimated in 1907 at 42,406. Belize, the capital, had 9,113 inhabitants in 1901. The principal products are mahogany, cedar, rubber, bananas, plantains, pineapples, oranges, mangoes, and coconuts. Sugar and cacao have been started. The higher parts afford good pasturage for cattle. With the increasing area that was being cleared for fruit-growing, labor was becoming scarce, and the planters appealed to the home government to permit the importation of coolies from India. In 1907 the imports amounted to \$2,415,723 (\$86,149 bullion and specie), and the exports, \$2,211,036 (\$143,344 bullion and specie). The United States supplies the greater portion of foodstuff

imports, as well as a large portion of articles formerly obtained from Great Britain, such as clothing, cotton goods, drugs, etc. Owing to the backward condition of farming and stock raising, American exporters also supply products that can be raised in the colony, such as corn, rice, vegetables, tobacco, etc. The principal exports are cedar, logwood, mahogany, bananas, and coconuts. The trade with the principal countries of origin and destination in 1907 was as follows:

From and to	Imports.	Exports.
United States	\$1,360,917	\$1,146,808
Great Britain	665,009	454,102
Mexico	191,581	221,130
Honduras	61,688	334,991

There is a railway of 60 miles along the east coast, and one of 15 miles along the west coast. The length of telegraph lines is 97 miles. The colony is administered by a Governor—in 1908, Gen. E. J. E. Swayne—assisted by an executive and a legislative council. The revenue in the fiscal year 1907-8 was \$395,183; the expenditure, \$516,700; and the public debt, \$168,815.

BRITISH INDIA. See INDIA, BRITISH.

BRITISH KOWLOON. See HONG KONG.

BRITISH NEW GUINEA. See PAPUA.

BRITISH NORTH BORNEO. A British protectorate, occupying the northern part of the Island of Borneo. Area, 31,106 square miles. Population, 160,000, including aborigines and Mohammedan and Chinese settlers. Sandakan, the capital, has 6,000 inhabitants. Jesselton is the principal town on the west coast. Over 1,000,000 acres have been alienated by the government for the cultivation of tobacco, tapioca, sago, rubber, coconuts, and coffee. Coal, iron, gold, mineral oil, and considerable deposits of manganese have been found. The first cargo of manganese was shipped in 1907. The imports in 1907 amounted to \$2,921,100; the exports, \$4,332,913 (tobacco, \$2,459,122). The pepper export in 1907 was 329 piculs (133½ lbs. each), against 273 in 1906 and 119 in 1905. Rubber is cultivated. The laborers are largely indentured Chinese, Japanese, and Javanese. There is a railway of 130 miles. In 1908 the government of the Moro Province in the Philippine Islands established a regular service between ports of the Moro Province, Philippines, and Sandakan. The protectorate is the possession of the British North Borneo Company. It is administered by a Governor in Borneo, whose appointment is subject to the approval of the Secretary for the Colonies, and a Court of Directors in London. The laws are based on the Indian code, and there is a court for the administration of Mohammedan law. The revenue and expenditure (exclusive of capital expenditure on railways and telegraphs) in 1907 were \$1,139,554 and \$683,326 respectively. There is a military force of 650 natives under European officers. In 1908 the Governor was E. P. Gueritz.

BRITISH SOMALILAND. A British protectorate in East Africa, on the Gulf of Aden. Area, estimated at 68,000 square miles. Population, estimated in 1906 at 300,029. Principal ports, Berbera, Bulhar, and Zeila, the capital. The inhabitants are Mohammedan, and entirely nomadic, except on the coast. Transport is by camels. The imports and exports in 1907-8

amounted to £233,238 and £215,708 respectively. The protectorate is administered by a Commissioner—in 1908, Capt. H. E. S. Cordeaux—and the three main ports are under the supervision of British officials. The revenue and expenditures for 1907-8 were estimated at £35,422 and £108,170 respectively; the grant-in-aid was fixed at £37,000. On March 19, 1907, an agreement was concluded for the regulation of Anglo-Italian relations in Somaliland.

BRITISH SOUTH AFRICA. A group of British possessions, including Cape Colony, Natal, The Transvaal, Swaziland, Orange River Colony, Southern Rhodesia, Bechuanaland Protectorate, and Basutoland. For details concerning the population, production, commerce, etc., of the various colonies and protectorates see under the respective titles. The total area is estimated at over 914,000 square miles. In 1904 there were 1,135,016 white inhabitants and 5,198,175 colored. In 1907 the total population was estimated at 6,724,480. In 1903 the South African Customs Union was formed. Most of the existing duties were increased and a preferential tariff, amounting to 20 per cent. *ad valorem*, was granted to products of the United Kingdom, and of such British colonies and possessions as shall grant reciprocal privileges to the products of British South Africa. Each colony or territory receives the customs duties collected on goods entered for consumption therein. In 1907 the total imports and exports (domestic produce) were valued at \$126,033,756 and \$231,631,993 respectively, against \$145,317,067 and \$206,324,678 in 1906. The distribution of imports and exports in 1907 by classes, was as follows:

Classes.	Imports.	Exports.
Animals	\$548,692	\$219,939
Articles of food and drink	33,003,413	1,546,334
Raw materials	11,239,581	42,368,820
Manufactures, other than food and drink	81,242,070	210,055
Gold		143,617,525
Diamonds		43,669,320
Exports of other than S. African produce ..		3,097,015

The principal imports in 1907 were: Apparel, \$7,708,153; wheat, \$4,067,229; wheat flour, \$3,016,214; drugs and chemicals, \$3,211,046; haberdashery, \$6,655,200; hardware and cutlery, \$5,398,720; iron and steel, \$4,235,143; leather manufactures, \$4,937,564; machinery, other than agricultural, \$8,719,665; sugar and sugar products, \$3,078,171. The principal exports in 1907 were: Coal, etc., \$2,876,745; diamonds, \$43,669,320; feathers, \$8,829,311; gold, \$144,184,383; hair, \$4,700,022; hides and skins, \$4,615,036; copper ores, \$3,272,575. The distribution of the trade in 1907 was as follows:

From and to	Imports.	Exports.
Great Britain	\$71,892,517	\$219,564,567
Australia	9,400,453	71,978
British India	3,875,721	83,682
Mauritius	1,847,061	74,397
Canada ..	1,927,594	3,733
Total British Empire	90,120,082	219,852,392
Argentina	2,240,195	12,254
Belgium	1,405,026	2,001,509
Brazil	1,457,381	
France	2,183,094	335,868
Germany	9,624,281	5,560,259
Sweden	1,525,987	511
Netherlands	1,740,432	68,518
United States	9,878,068	432,427

In 1907 \$19,643,700 of imports and \$2,467,881 of exports passed through the Portuguese ports of Lourenço Marquez and Beira. The principal British South African ports, with their imports and exports respectively in 1907, are: Cape Town, \$25,272,254 and \$184,907,340; Port Elizabeth, \$20,224,100 and \$15,333,314; East London, \$14,967,098 and \$7,086,081; Durban, \$34,166,609 and \$14,581,998.

The High Commissioner for South Africa represents the Crown in all matters occurring in South Africa beyond the limits of the colonies. He has the power to invite conferences of the representatives of the colonial governments for the discussion of affairs of common interests. Besides being Governor of the Transvaal Colony, he also supervises the administration in Basutoland, Bechuanaland, Swaziland, Southern Rhodesia, and Northwestern Rhodesia (Barotseland). The High Commissioner in 1908 was the Earl of Selborne, who was appointed March 2, 1905. The British garrisons in 1908-9 numbered 16,450 officers and men.

HISTORY. The federation tendency, which had been in evidence for several years, continued to gain strength in South Africa during 1908. On May 4. there was assembled at Pretoria a conference of official representatives from Cape Colony, Natal, The Transvaal, Orange River Colony, and Rhodesia. This convention was nominally the fourth South African customs and railway conference, called to discuss and draw up a new customs convention and arrange as to inter-colonial railway rates. But it immediately developed into a movement for a closer union of the colonies, and discussion was directed to the larger issues involved. This conference adopted the following resolution: "The delegates of the self-governing colonies have adopted the principle of closer union and undertake to submit certain resolutions to their parliaments with reference thereto. They also undertake to recommend to their parliaments the appointment of delegates to a national convention for the purpose of forming a constitution." To carry out the objects of the conference, a convention was proposed of 12 delegates from Cape Colony, 8 from the Transvaal, 5 from Natal, 5 from Orange River Colony, and 2 from Rhodesia, which was to draft a federal constitution for ratification by the colonies. The plan was approved in resolutions adopted on June 22 by the Cape Colony House of Assembly, on June 23 by the Transvaal Assembly, on June 24 by the Orange River Assembly and on July 1 by the Natal Assembly, and the delegates to the proposed national convention were duly appointed. Some dissatisfaction was manifested with the disproportionate representation of the predominant parties in the various legislatures which elected the delegates, due largely to the preponderance of the Boer element, and it was suggested that adequate provision should be made for minority representation. The chief opposition came from Natal, where the Boer preponderance was much less marked than in the other colonies. Events showed, however, that such fears of a desire on the part of the Boer element to shape the proposed union in their own interest were unjustified. Both in the convention and outside, the stand taken by men like General Botha or ex-President Steyn of the Orange Free State showed that they unreservedly accepted the results of the late war and that they were actuated by a sincere desire to pro-

COPYRIGHT, 1907, BY DODD, MEAD & CO.

mote the welding together of the races into a single nation.

The strongest feeling for the union was manifested by the Transvaal and this was followed by the Orange River Colony. Cape Colony was also in favor of the federation, with certain provisions for protecting its representation. The convention met as scheduled, at Durban on Oct. 12, and messages were received from the King and from the Imperial government, expressing good wishes as to the movement. The convention was opened by Sir Matthew Nathan, Governor of Natal, and Sir Henry de Villiers, a delegate from Cape Colony, was president. The proceedings of the convention were secret, though there was some knowledge of the general trend of its discussions. It adjourned on Nov. 5 to meet again at Cape Town on the 23d. It was understood at the end of the year that the union had been unanimously agreed upon. Among the important questions discussed by the convention were those of language, representation, the status of the natives, and the site of the Federal capital. The Dutch, while recognizing the necessity of the use of English as the official language, were reluctant and determined not to give up their native tongue. The basis of representation provoked serious discussion. This was due to the fact that Cape Colony and Natal possessed over-represented country districts, and this was frankly defended by some of the delegates to the conference on the ground that the townspeople were more stable and consequently deserved over-representation. In addition, the franchise in the two colonies named is open to natives, while in the Transvaal and the Orange River Colony it is restricted to the white population. This made the establishment of a uniform Federal franchise particularly difficult, since the two Boer colonies were determined not to confer the vote on the colored races. Aside from the franchise, the native question is one of the most serious with which a federated South Africa will have to deal. The new Commonwealth will contain a population of about 1,150,000 whites as against more than 6,000,000 people of non-European descent, the odds thus being incomparably greater than was the case at the formation of the American Union, the Canadian Federation, or the Australian Commonwealth. For the site of the capital there was intense rivalry between Cape Town and Pretoria. The former had in its favor the greater historical prestige, a more favorable climate and the advantage of quicker communication with Europe. On the other hand Pretoria would be more convenient for the representatives of Natal and Orange River Colony as well as the Transvaal. Moreover, the Transvaal, as the richest, by far, of the colonies, maintained that it should receive due recognition. At the end of the year it was understood that this was the only question upon which the convention had not come to an agreement.

BROMFIELD, EDWARD THOMAS. An American Congregationalist clergyman, died on July 27, 1908. He was born at Coventry, England, in 1833, and was educated at New College, London. After a short career as a journalist and magazine contributor he obtained the pastorate of the Finsburg Park Congregational Church, London, where he remained for several years. In 1867 he went to Toronto, Canada, and in 1871 he moved to New York City. In addition to his pastoral work he wrote numerous articles for various periodicals, lectured

extensively, and was for ten years a secretary of the Presbyterian Board of Publication. He was for some time literary editor of the *North American Review*.

BROMURAL. A new nerve-sedative which is said to produce sleep without markedly affecting the circulation or respiration. It occurs as small white, almost tasteless needles, soluble in hot water, ether or alcohol, less readily in cold water. Its chemical name is alpha-monobromo-isovaleryl-urea and its formula is $C_6H_{11}N_2O_2Br$. The drug acts as a sedative and hypnotic in functional nervous diseases, but is not efficacious where pain, cough, angina pectoris, and excitement or delirium exist. The advantages claimed for bromural are the absence of depressing effects and prompt elimination, all action ceasing in from three to five hours.

BROOKLYN INSTITUTE OF ARTS AND SCIENCES. An educational institution in Brooklyn, New York City, incorporated in 1824 as the Brooklyn Apprentices' Library Association, reincorporated in 1835 as the Brooklyn Institute, and again incorporated in 1890 under its present title. The total membership in January, 1909, was 8,200. The income for the year ending July 1st, 1908, was \$209,893.63. The endowment fund is \$400,000. The general educational work of the Institute is carried on in the Brooklyn Academy of Music. The central Institute Museum contains art and scientific collections, the property of the Institute. The city contributes for the maintenance of the Central Museum and the Children's Museum for the year 1909 \$103,905. The Biological Laboratory of the Institute, established at Cold Spring Harbor, L. I., in 1890, has the use of property valued at \$50,000. The total Institute attendance for the year ending June 1st, 1908, was 497,445.

BROOKS, WILLIAM KEITH. An American Zoologist, died on Nov. 11, 1908. He was born in Cleveland, Ohio, on Mar. 25, 1848, graduated at Williams College in 1870, and took his Ph.D. degree at Harvard in 1875. He was assistant in the Boston Society of Natural History in 1875-76, when he became associate professor, and thereafter (1883) was professor of zoology at Johns Hopkins University. Professor Brooks was a born naturalist, but an observer rather than an experimenter. While he was a student at Williams he accompanied an expedition to South America, and immediately after graduation, he became associated with Agassiz in the famous summer school experiment on Penikese Island, in Buzzard's Bay, Mass. In 1875 he had a part in the opening of a similar school at Cleveland, Ohio. Soon after his appointment to the faculty of Johns Hopkins, he induced certain citizens of Baltimore to subscribe a fund for the establishment of the Chesapeake Marine Laboratory, and he established summer schools in Chesapeake Bay at Chrisfield, at the old fort, off Old Point Comfort, and at Hampton, where he pursued and encouraged the study of marine biology. It was during these researches that Professor Brooks made the very important discovery that the eggs of the American oyster can be fertilized outside of its body. This led to the establishment of the Maryland Oyster Commission, and the development of the oyster industry in Chesapeake Bay. On this subject he lectured frequently, and wrote his popular

book, *The Oyster* (1891, 2d rev. ed., 1905). He was also chiefly responsible for the establishment of the marine station of the Bureau of Fisheries, at Beaufort, N. C. His contributions to the technical literature of marine life include his papers on the gastropods and amellibranchs (1875 and afterward); on the *Lingula*; on the development of the squid, on *Squilla* and other stomatopods, and a series of papers on the *Salpa* (stock-fish), followed by his important and exhaustive monograph on that subject, *A Monograph of the Genus Salpa* (1893). His other publications include: the article "Biology" in the *New International Encyclopædia*, *Hand-Book of Invertebrate Zoology* (1882); *Heredity* (1884); *The Development and Protection of the Oyster in Maryland* (1884), and *Foundations of Zoology* (1898).

BROWN TAILED MOTH. See ENTOMOLOGY.

BROWNSVILLE INCIDENT. See UNITED STATES.

BROWN UNIVERSITY. An institution of higher learning at Providence, R. I., founded in 1764. The attendance in the autumn of 1908 was 993, the largest in the history of the institution. Of these 180 are in the Women's College. The University has a system of "coordinate" education, but not of coeducation, the Women's College being about ten minutes distant from the main campus. The foundations of the new John Hay Library were laid in September, and the structure will be two years in building. The old library will be used for department libraries and seminaries, of which there are now 17 scattered in various buildings. Five new fraternity chapter houses have been built during the last two years, and the university has taken measures to render the dormitories more attractive and so retain the students on the campus. The whole question of the relation of the university to the fraternity system is now under discussion. The director of physical training, a member of the faculty, has been made supervisor of athletics, and all managers of athletic teams are directly responsible to him. Three of the faculty have been absent on sabbatic years with half salary. Extension lectures for teachers are given in the late afternoon and evening, and the demand for such lectures is steadily maintained. The question of the relation of the academic to the engineering department of the university has been vigorously discussed during the year, and the fellows have appointed a special committee to investigate and report. The weight of opinion is against any separation of the two classes of students in undergraduate years, and in favor of a larger infusion of cultural study into the engineering courses. One hundred and ninety-six degrees were granted at the last commencement, and preparation was begun for the celebration of the 150th anniversary of the founding of the institution, to be celebrated in 1914. The total endowment of the university is now \$3,500,000. The president is Dr. W. H. P. Faunce.

BRUCE, SIR GEORGE BARCLAY. An English engineer, died on Aug. 25, 1908. He was born

at Newcastle-on-Tyne, on Oct. 1, 1821, studied engineering in that city, and subsequently was engineer-in-chief of the Royal Border Bridge, over the Tyne, for the York, Newcastle & Berwick Railway. Thereafter he was employed chiefly in India, where he was one of the pioneer railroad builders, having a part in the construction of lines in Bengal and Madras. He was president of the Institution of Civil Engineers in 1887-88.

BRUNEL. A native state on the west coast of the island of Borneo, lying southwest of British North Borneo (q. v.). In 1906 it became a British protectorate. Area, 8100 square miles; population, 25,000. Brunel, the chief town and residence of the Sultan, is built entirely over the water; population, 10,000. Some coal is mined, the Rajah of Sarawak (q. v.) having a monopoly of coal mining. Cutch and other jungle products are exported. A British resident supervises the general administration. A loan of \$200,000, made by the Federated Malay States, in 1906, was used partly for buying out some of the monopolists who had obtained the right to collect the revenues.

BRYAN, WILLIAM JAMES. United States Senator from Florida, died on Mar. 22, 1908. He was born in Orange County, Fla., on Oct. 10, 1876, graduated at Emory College in 1896, and in law at Washington and Lee University in 1899, and at once began to practise law in Jacksonville, Fla. From 1902 until just before his appointment (Dec. 25, 1907) to the United States Senate to succeed Stephen R. Mallory (who died on Dec. 23, 1907), Mr. Bryan was solicitor of the Duval County (Fla.) Criminal Court of Record. He was the youngest member of the Senate, and with two exceptions (Henry Clay, of Kentucky, who was 29, and Armisted T. Mason, of Virginia, who was 31, upon entering the upper House) the youngest man ever to sit in that body. Senator Bryan was a man of unusual ability and of great promise. He was a member of the Senate for only seventy days, and during thirty-three days of this interval he was ill of typhoid fever, of which he died.

BRYAN, WILLIAM JENNINGS. See PRESIDENTIAL CAMPAIGN.

BRYN MAWR COLLEGE, an institution for the higher education of women at Bryn Mawr, Pa., founded in 1885. The attendance in the autumn of 1908 was 420, of whom 72 were graduate students. The faculty and teaching staff number 55. In 1908 the gymnasium was rebuilt from funds raised by the present students. The course of study is arranged according to the graduate system. The library contains 55,000 volumes and 8,000 pamphlets. The productive funds of the college amounted in 1908 to \$1,128,494, and the income to \$80,709. The president is Miss M. Carey Thomas, Ph.D., LL.D.

BUCHANAN, WILLIAM INSCO. An American diplomat, special commissioner to Venezuela. He was born near Covington, Ohio, on Sept. 10, 1853; and was educated in the district schools. He assisted in the organization and management of the first four "corn palaces" at Sioux City, Ia., and was the Democratic member for Iowa on the World's Columbian Commission. He also served as chief of the Department of Agriculture and later as head of the Live Stock and Forestry Departments at the World's Fair.

From 1894 to 1900 he was envoy extraordinary and minister plenipotentiary to Argentina, with which country he succeeded in arranging a reciprocity treaty; and he also was the arbitrator selected by the Argentine and Chilean governments to fix the boundary line in the Puna de Atacama. In 1901 he was appointed director-general of the Pan-American Exposition, and the following year was United States delegate to the second Pan-American Conference at Mexico. In 1903 he was appointed first minister from the United States to Panama. He was special commissioner to Colombia to settle the questions which arose over the public debt of that country as a result of the separation of Panama, and in December, 1908, was sent as special commissioner to Venezuela to discuss with the new president, Gomez, the points at controversy between that country and the United States.

BUCKWHEAT. As reported by the United States Department of Agriculture the acreage of buckwheat in the United States in 1908 amounted to 803,000 acres, the production to 15,874,000 bushels, as compared with 800,000 acres and 14,290,000 bushels in 1907. The average yield per acre in 1908 was 19.8 bushels, and the average price per bushel on Dec. 1, 75.6 cents, which was the highest average price since 1883. The year's crop represented a total farm value on Dec. 1 amounting to \$12,004,000, which was the highest total value since 1869. The total production for 1908 was also the largest in 40 years. The principal buckwheat-growing States and their yields for the year 1908 are as follows: New York, 6,827,000 bushels; Pennsylvania, 4,992,000 bushels; Michigan, 742,000 bushels; Maine, 690,000 bushels; West Virginia, 378,000 bushels, and Virginia, 360,000 bushels. Of the 24 States reporting yields, these 6 produced nearly 14,000,000 bushels or about 93 per cent. of the total crop, while the combined yield of New York and Pennsylvania amounts to about 75 per cent. of the total crop for the year. The highest average yield per acre, 30 bushels, was secured in Maine and Delaware, and the lowest, 13.5 bushels, in Michigan.

BUILDING. See ARCHITECTURE.

BULGARIA. Formerly a principality, now a kingdom (see below, *History*) of the Balkan peninsula. Area, 37,199 square miles, including Eastern Rumelia, with 12,585 square miles; population (1905), 4,035,615, consisting of 3,204,996 Bulgarians, 497,818 Turks, 94,640 Gypsies, 83,942 Roumanians, 69,757 Greeks, 36,455 Spanish Jews, 5,021 Germans, 3,270 Russians, and 39,707 of other nationalities. According to religions there were in 1905 3,346,773 Greek-Orthodox, 603,113 Mohammedans, 37,653 Jews, 29,442 Roman Catholics, 12,694 Armenian-Gregorians, 5,402 Protestants, and 538 various. In 1906 there were 37,779 marriages, 180,074 births, and 90,940 deaths. The principal cities in 1905 were: Sofia, the capital, 82,621; Philippopolis, formerly capital of Eastern Rumelia, 45,707; Varna, 37,417; Rustchuk, 33,632; Slivno, 25,027; Shumla, 22,275; Plevna, 21,145; Stara-Zagora, 20,788.

EDUCATION. Public instruction is free, except for the well-to-do, and nominally obligatory from 8 to 12 years of age. The State contributes two-thirds to the maintenance of elementary schools and one-half to that of higher schools. In 1905-6 there were 4,584 elementary schools,

with 8,785 teachers and 400,216 pupils (148,343 girls); 199 lower middle-class schools, 16 gymnasias, 85 special and technical schools, and 85 other schools, with a total of 2,145 teachers and 44,041 pupils (16,723 girls). The national university at Sofia, with faculties of history and philology, physics and mathematics, and law, had about 1,000 students.

PRODUCTION. In theory the State is the owner of the land. The landholder has a perpetual lease descending to heirs, and pays one-tenth of the produce as rent, largely in kind. The communes hold pasture and woodland in perpetuity, paying no rent. The commune members have pasture and wood-cutting rights over these lands. Agricultural methods are in a transition state. On one farm operations may be conducted with primitive implements, while on an adjoining farm the most modern appliances may be in use. The area under cultivation is increasing, agriculture is displacing cattle-raising, and State lands are being alienated. The area and production of the principal crops in 1907, and the estimates of them for 1908 are shown in the following table:

Crop.	1908, estimated.		1907.	
	Area.	Production.	Area.	Production.
	<i>Acres.</i>	<i>Bu. a</i>	<i>Acres.</i>	<i>Bu. a</i>
Wheat	2,270,000	47,072,000	2,360,000	36,944,000
Rye	370,000	6,634,000	430,000	6,600,000
Barley	345,000	9,767,000	350,000	7,000,000
Maslin	180,000	3,607,000	220,000	2,483,000

a Bushels of weight; Wheat, 60 pounds; rye, 56 pounds; barley, 48 pounds; maslin, 58 pounds.

Other agricultural products are rice, cotton, silk cocoons, wine, tobacco, etc. In 1906 there were exported 1585 tons of tobacco and 462 tons of cocoons. In 1907 there was produced 546,253 bottles of attar of roses against 843,582 in 1906. In 1905 there were 2,167,275 cattle, 536,616 horses, 124,216 asses, 11,828 mules, 463,241 pigs, 1,370,201 goats, and 8,081,816 sheep. All minerals belong by law to the State. The government coal mines at Peruik yielded 161,000 tons in 1906. Concessions for coal-mining in the Balkans, near Trevna, were granted to private companies. Gold, silver, lead, copper, manganese, and large iron deposits are found, but await development. Near Burgas there are salt works. Native manufactures received a forward impulse during 1907, largely owing to the prohibitive nature of the specific tariff which came into force Jan. 14, 1906, combined with the law for encouraging domestic industry. Concessions for the monopoly of specified areas are granted to intending factory builders, free sites are offered, taxes are remitted, etc. In the silk industry a 2-leva bonus is paid for every kilogram of raw silk exported, for a period of five years from the date of the first consignment. A school of carpentry was opened by the Philippopolis Chamber of Commerce, and it was hoped gradually to extend it so as to include other trades. Artisans were beginning to adopt modern methods and implements. The new tariff was directly responsible for the establishment of the following new industries: Artificial flowers, walking sticks, umbrellas, brushes, straw hats, cardboard, etc., while the developments in bootmaking, copperwork, cooperage, carpen-

tering, dyeing, weaving, basket making, etc., are very marked.

FOREIGN COMMERCE. In 1907 the imports and exports amounted to 124,639,000 and 125,595,000 levas respectively, against 108,874,000 and 114,573,000 levas in 1906 (1 leva = 19.3 cents). The principal imports in 1907 were: Metals and manufactures thereof, 15,240,000 leva; textiles, 41,351,000; implements and machinery, 10,815,000; colonial goods, 6,082,000; drugs, chemicals, and dyes, 4,342,000; wood and manufactures thereof, 4,555,000; leather and its manufactures, 7,236,000. The principal exports in 1907 were: Live animals, 8,188,000; animal foods, 14,760,000; cereals, 83,306,000; attar of roses, 4,662,000; textiles and cocoons, 7,370,000; hides and skins, 3,289,000. The trade with the principal countries of origin and destination in 1907 was as follows, in levas:

From and to	Imports.	Exports.
Turkey	17,548,000	27,283,000
Austria-Hungary	34,688,000	8,023,000
Germany	19,660,000	17,022,000
France	6,593,000	6,990,000
Belgium	4,263,000	26,970,000
Great Britain	21,424,000	20,706,000
Italy	5,484,000	3,100,000
Russia	4,771,000	249,000

COMMUNICATIONS. In 1907 the Bulgarian ports were entered by 14,190 ships of 3,247,791 tons, and cleared by 14,198 ships of 3,258,420 tons. The merchant marine in 1907 consisted of 14 steamers, of 2,984 tons, and 85 sailing vessels, of 2,366 tons. The railways in operation in 1908 had a length of 999 miles, of which 802 belonged to the State, and 556 miles were in construction. In 1908 there were 5 lines under construction. In 1908 there were 5 lines under be completed by the end of the year; Devna to Dobritch, Radomir to Kustendil, Tirnovo to Stara Zagora, and Mezdra to Vidin—these four to be completed in 1910 and 1911. The Mezdra-Vidin line, which with its branches was to total about 150 miles, promised to be particularly important, as it will connect Sofia and Philippopolis with the Danube. The Tirnovo-Stara Zagora line will link North and South Bulgaria through the Balkans. The length of State telegraph lines in 1907 was 4,257 miles.

BANKS. In 1907 the Balkan Bank, an offshoot of the Vienna Bank Union, was established with branches at Rustchuk, Varna, and Philippopolis.

GOVERNMENT. Until Oct. 5, 1908, when it declared itself an independent kingdom, Bulgaria was an autonomous principality under Turkish suzerainty, the Prince being also Governor-General of Eastern Rumelia, which paid an annual tribute to Turkey, but was in all other respects an integral part of Bulgaria. The present King or Czar—formerly Prince—is Ferdinand, of the House of Saxe-Coburg and Gotha, born Feb. 26, 1861; elected Prince of Bulgaria July 7, 1887; assumed the government Aug. 14, 1887; proclaimed Czar of the Bulgarians Oct. 5, 1908. The kingdom is hereditary. The unicameral Sobranie, or National Assembly, consists of 189 members, elected by universal suffrage, one to every 20,000 inhabitants. The Sobranie is elected for five years, but may at any time be dissolved by the sovereign, when

new elections must take place within four months. Bills passed by the Sobranie require the assent of the King. The Grand Sobranie, elected in the same manner, but with double the number of members of the Sobranie, decides concerning acquisition or cession of territory, changes in the constitution, a vacancy on the throne, or the election of a regent.

FINANCE. The revenue and expenditures in 1906 were 134,440,302 and 115,658,812 leva, respectively. In the budget for 1908, the revenue and expenditure balanced at 127,235,700 leva. The principal estimates of revenue for 1908 were: Direct taxes, 41,380,000 leva; customs and excise, 41,890,000; railways, 15,050,000; and of expenditure: Public debt, 33,954,611; public instruction, 11,878,947; war, 30,050,000; public works, 16,469,503. The public debt stood on Jan. 1, 1908, at 470,761,770 leva, of which 444,519,868 was permanent. The tribute of Eastern Rumelia was 2,951,000 leva per annum.

ARMY AND NAVY. Military service is universal and compulsory between the ages of eighteen and forty-six years, with a period of continuous service in the infantry of two years and in the other arms of three years, and a reserve service in the infantry of eighteen years and in the other arms of sixteen years, the longest service in the world with a consequent large number of reservists. The regular army in time of peace consisted in 1908 of 36 regiments of infantry; 9 regiments field, 3 regiments mountain, and 3 regiments fortress artillery; in addition to engineers, depot and auxiliary troops, numbering 22,813 of all grades. Besides this there were 17,107 men of the supplementary reserve who are liable to four or six months' service, and of whom 9,720 were called to the colors. The total available force in the first line was therefore about 40,000 men. The field army when completely mobilized has a war strength of 375,000 combatants, organized into 9 army corps and 1 cavalry division, and can be mobilized in about ten days. A regiment of railway troops was organized in 1908. The army is of the most modern type in respect to organization, armament and training, and is a very large one for so small a state. The flotilla consists of an artillery-torpedo vessel of 720 tons, and 3 torpedo boats, 300 tons.

HISTORY.

INTERNAL AFFAIRS. On Mar. 11, 1907, the Prime Minister, M. Petkoff, was assassinated and was succeeded by Dr. Gudeff. On Jan. 21, 1908, the Gudeff Ministry resigned and a new ministry was chosen with M. Malinoff as Premier (Jan. 29), from the then dominant Democratic party. In the general elections of June 7th the Democratic party was completely victorious, winning 170 seats out of a total of 203; thus reducing the Opposition to 33, of whom 21 belonged to the newly formed political group, the Agriculturists. The new Sobranie was opened by Prince Ferdinand on June 28th.

BULGARIAN INDEPENDENCE. The great event of the year was Prince Ferdinand's declaration of Bulgarian independence at Tirnovo on Oct. 5th, 1908. The relations of this event to the general European situation are discussed in the article BALKAN QUESTION (q. v.); where also will be found an account of the difficulty arising between Bulgaria and Turkey over the latter's failure to invite the Bulgarian representative to a diplomatic dinner, and Bulgaria's

military occupation of the Oriental Railway, which belonged to Turkey. The declaration of independence was received in Bulgaria with popular enthusiasm. By the Treaty of San Stefano, concluding the Russo-Turkish War, the territory of Bulgaria was considerably enlarged, including a great part of what is now known as Macedonia, and having a frontage on the Aegean Sea; but the Powers gathered at the Congress of Berlin would not consent to so great a curtailment of Turkish territory, and by the Treaty of Berlin the three vilayets constituting the present Macedonia were cut off from Bulgaria and placed under Turkish administration. Bulgaria became an autonomous principality, tributary to Turkey and under a Christian prince to be selected by the people, subject to the approval of the Porte. Eastern Rumelia, which had been included in the territory of Bulgaria by the Treaty of San Stefano, became a province of Turkey to be ruled by a Christian Governor. Although it was provided by the treaty that Bulgaria should pay tribute to Turkey and also a share of the Ottoman national debt, these requirements were disregarded and became in fact a dead letter. After the revolutionary movement in Eastern Rumelia in 1885, that province was virtually annexed by Bulgaria, and the Powers paying no attention to Turkish protests, this status came to be gradually accepted, though it was definitely agreed that Eastern Rumelia should continue to pay tribute. Thus by the Treaty of Berlin, the territory temporarily united by the preceding Treaty of San Stefano to form Bulgaria fell apart into the three divisions of Bulgaria, a vassal state of Turkey, Eastern Rumelia, an autonomous province under Turkish control, and Macedonia, restored unconditionally to Turkey. The aim of Bulgaria has been directed toward restoring as far as possible the previous territorial status.

The acquisition of Eastern Rumelia was the first step toward the realization of the dream of a Greater Bulgaria; and it has always been the hope of Bulgarian statesmen that the Macedonian problem might somehow be solved in her favor, their chief ground being that the Bulgars were the predominant element in the Macedonian population. The Turkish revolution, by establishing a constitutional government, seemed for the time at least to remove the Macedonian difficulty. The months following the restoration of the Turkish constitution were marked by more pacific relations between the discordant Macedonian peoples than had existed in several years past. Hence the problem of Macedonia seemed to be in a fair way of settlement by other means than those which Bulgaria had hoped.

The declaration of independence, coming at this time, seemed to many to be intended as a blow to the new Turkish régime; for it was argued that for years Bulgaria had in fact been independent, and that she chose this moment for her declaration in order to embarrass the Young Turk party. It was criticised also as an act of treason to the neighboring Slav states. It was said that Bulgaria, having, in return for Austrian recognition of her independence, acknowledged the annexation of Bosnia and Herzegovina (which immediately followed) had taken a purely selfish course, disregarding the common Slav interests which required a united

front against Austrian encroachment, and specifically against Austrian endeavors to divide the Slav states. In Bulgaria the course of the government in not acting with Serbia and Montenegro was defended on the ground that Serbia had begun war on Bulgaria in 1885 when the latter's annexation of Eastern Rumelia was taken as a threat against the safety of the other Slav states in the Balkans. Nor did Serbia deserve Bulgarian aid in preventing the Austrian annexation of the provinces, for Serbia in 1882 had agreed with Austria to abandon her pretensions to Bosnia and Herzegovina, and for twenty years had done nothing to advance her own interests in those provinces. As to Turkey, the Bulgarian defense of their policy took the form of belittling the revolutionary movement. It was commonly declared that the revolution was sure to fail and that the Young Turks would be found stronger in words than in deeds. From the first, however, Bulgaria was ready to discuss the question of compensation to Turkey, and on receiving the advice of the Powers (Oct. 27th) that she should undertake negotiations to that end with Turkey, promptly despatched a delegation to the Porte and began negotiations whose results were not yet known at the close of the year. See BALKAN QUESTION.

The text of Ferdinand's declaration of independence at Tirnovo was as follows:

"By the will of our never-to-be-forgotten liberator and the great kindred Russian nation, aided by our good friends and neighbors, the subjects of the King of Rumania, and by the Bulgarian heroes, on Feb. 18th, 1878, chains of slavery were broken by which for so many centuries Bulgaria, once a great, glorious Power, was bound.

"From that time till today, for full thirty years, the Bulgarian nation, preserving the memory of those who had labored for its freedom and inspired by their tradition, has worked incessantly for the development of its beautiful country, and under my guidance and that of the departed Prince Alexander has made it a nation fit to take an equal place in the family of civilized peoples, and endowed with gifts of cultural and economic progress. While proceeding on this path, nothing should arrest the progress of Bulgaria, nothing should hinder her success. Such is the desire of the nation; such its will. Let that desire be fulfilled. The Bulgarian nation and its chief can have but one sentiment, one desire. Practically independent, the nation was impeded in its normal and pacific development by certain illusions and formal limitations which resulted in a coldness of relations between Turkey and Bulgaria. I and the nation desire to rejoice in the political development of Turkey. Turkey and Bulgaria, free and entirely independent of each other, may exist under conditions which will allow them to strengthen their friendly relations and to devote themselves to peaceable internal development.

"Inspired by the sacred purpose of satisfying national requirements, and fulfilling the national desire, I proclaim, with the blessing of the Almighty, Bulgaria, united since Sept. 6, 1885, as an independent kingdom.

"Together with the nation, I firmly believe that this act will meet with the approbation of the Great Powers."

BULLER, SIR REDVERS HENRY. A British soldier, died on June 2, 1908. He was born in Devonshire in 1839, and after attending Eton, entered the army as ensign in the King's Own Rifles in 1858. He served in the Chinese campaign in 1860, and in Canada in 1870 during the Red River rebellion. He was on General Wolseley's staff in the Ashanti War in 1874, and during the Zulu War of 1879 won distinguished honor as commander of the Frontier Light Horse. During the Boer War of 1881 he was chief-of-staff to Sir Evelyn Wood. He distinguished himself in the Egyptian and Sudan campaigns of 1882 and 1884-85, and as commander of a brigade at Tamoi in the latter campaign, he saved the day for the British. From 1887 to 1890 he was quartermaster-general with the rank of major-general. In 1890 he was appointed adjutant-general, and in 1891 reached the rank of lieutenant-general. At the beginning of the war in South Africa in 1899, he was made commander of the forces in Natal, and his first task was the relief of Ladysmith, which was accomplished only after severe fighting lasting several months in which the army under his command suffered several bloody repulses, and after the Boer Army had retired because of the surrender of Cronje to Lord Roberts. Ladysmith was relieved Mar. 1, 1900, and Buller was engaged in clearing Natal of the Boers until relieved of his command later in the year. He was severely criticised for his conduct of the campaign and his impatience under criticism and insubordinate comments on his superior officers after his return to England caused his resignation to be demanded in 1901.

BÜLOW, BERNHARD H. M., Prince von, German Chancellor. See GERMANY.

BUREAU OF AMERICAN ETHNOLOGY. See ANTHROPOLOGY.

BUREAU OF AMERICAN REPUBLICS. INTERNATIONAL. An official institution, supported by the American Republics and devoted to the encouragement of Pan-American commerce, friendship and peace. The Bureau was established in 1890 in accordance with resolutions passed at the first International Conference of American Republics, held in Washington in 1899-90. It was continued by resolutions of the second conference, held at Mexico in 1901, and again with enlarged scope and sphere by the third Conference at Rio de Janeiro in 1906. The purposes of the Bureau are to develop commerce and trade, and to promote better relations, closer acquaintance and more intimate association among the American Republics. It keeps in touch with the commercial affairs in both North and South America and uses its branches to promote trade. It keeps in touch, too, with men in public life, scientists, and travellers, providing them with a large variety of information which will increase their interest in the different American nations. The Bureau publishes numerous handbooks, pamphlets and maps. It is the office or agency, and also the custodian of the archives of the International American Conferences. It has charge of the correspondence relating thereto, the ratification of their resolutions, and the issuance of calls for new conferences.

The fiscal year ending June 30, 1908 was a period of great expansion and growth for the Bureau, due partly to the visits of Secretary Root to the countries of South America and

Mexico in 1906-7, and to the gift of Mr. Andrew Carnegie of \$750,000 for the erection of a new building for the Bureau in Washington. As a result of the efforts of the Bureau along commercial lines, a large number of great manufacturing and importing firms of the United States have entered the Latin-American field. The Bureau also has encouraged the study of Spanish in the universities, colleges and academies of the United States and of English in the corresponding schools of Latin-America, and it has provided students and specialists with a large amount of information concerning the history, literature, and the social and scientific life of these countries. It has published a series of handbooks descriptive of the various countries. These are to be revised as rapidly as occasion calls for. As a result of the efforts of the Bureau, interest was stimulated in the National Exhibition held at Rio de Janeiro during the summer of 1908, and as a result, travel from the United States to Brazil and South America was greatly increased. Attention was drawn to the National Exhibition to be held at Quito, Ecuador in 1909. Arrangements in the United States relating to the Pan-American Scientific Congress in Santiago in December, 1909, have been practically in charge of the International Bureau. The Bureau has directed its energies and influence toward the formation of Pan-American committees in each American Republic in accordance with the action of the third Pan-American Conference, held at Rio de Janeiro in 1906, with the result that the majority of the countries have named their respective committees.

The Bureau has under its care the Columbus Memorial Library which contains a large collection of books relating to the States of Central and South America. The construction of the new building of the Bureau was carried on during 1908, and it is the expectation that it will be ready for occupancy in November, 1909. The Director of the Bureau is John Barrett; and the Secretary, Francisco J. Yánes.

BUREAU OF ANIMAL INDUSTRY. See MEAT AND MEAT INSPECTION.

BURMA. See INDIA.

BURTON, THEODORE E. An American legislator, representative to Congress (Republican) from the Twenty-first Ohio District. He was born at Jefferson, Ohio, on Dec. 20, 1851, attended Iowa College and Oberlin College, graduating from the latter institution in 1872; and was admitted to the bar in 1875. He was elected representative to Congress in 1888 and was a member of each succeeding Congress, with the exception of the Fifty-second (1891-3), having been elected to his tenth term in 1908. As a representative, he won distinction for his efficient work in connection with the Committee on Rivers and Harbors, of which he was Chairman, and the Committee on Banking and Currency, to which subjects he had devoted much study. In 1907 at the solicitation of the Republican leaders, both National and State, he ran for mayor of Cleveland against Tom L. Johnson, but was defeated. After the election of a Republican State legislature in 1908 was assured, he announced himself as a candidate for United States Senator to succeed J. B. Foraker (q.v.). His principal opponent for the nomination was Charles P. Taft, a brother of the President-elect, and a bitter factional fight, which at one time threatened to disrupt the party in Ohio, was only averted

by the withdrawal in December, 1908, of both Mr. Taft and Senator Foraker. This action insured Mr. Burton's election. He is the author of *Financial Crises and Periods of Commercial Depression* (1902) and a *Biography of John Sherman* (1906). See OHIO.

BUSCH, WILHELM. A German caricaturist and rhymester, died on Jan. 9, 1908. He was born on April 15, 1832, in Wiedensahl, near Stadthagen, Hanover, the son of a merchant, and studied engineering in the Polytechnic Institute of Hanover, but turned to art and studied painting in the academies of Düsseldorf, Antwerp and Munich. The exactness required of the draughtsman was not to his liking, however, nor had he the painter's love of beauty. On the other hand, he had talent, originality and a broad sense of humor, and these qualities found expression in a series of satirical caricatures, which he began to supply to the *Fliegende Blätter* in 1859. Thereafter he wrote books of comic verse, illustrated by his own rough but singularly expressive drawings, which made him enormously popular throughout Germany. The best known of his works are *Max und Moritz*, translated by Robert C. Brooks: *Schnurrddibur; der heilige Antonius; Hans Huckelbein der Unglücksrabe; Die fromme Helene; Pater Filucius; and Plisch und Plum.*

BUSSEY INSTITUTION. See AGRICULTURAL EDUCATION.

BUTTER. See DAIRYING.

CAIRD, EDWARD. An English educator and philosopher, died Nov. 1, 1908. He was born in Greenock, Scotland, Mar. 20, 1835, and graduated at Oxford University in 1863, was Fellow at Merton College in 1864-66. He was appointed professor of moral philosophy at Glasgow University in 1866, and served until 1893, when he became master of Balliol College, Oxford. In 1901-02 he was Gifford lecturer on philosophy at Glasgow University. His writings include: *Social Philosophy and Religion of Comte* (1885); *The Critical Philosophy of Immanuel Kant* (1889); *Essays on Literature and Philosophy* (1892); and *The Evolution of Religion* (1893).

CALCIUM. See CHEMISTRY, INDUSTRIAL.

CALIFORNIA. One of the Pacific Coast States of the United States. Its area is 158,297 square miles, of which 2,205 miles are water. Its population in 1900 was 1,485,000. According to the Federal estimate of 1908 the population in that year was 1,702,377. By estimates of 1906 the population of the largest cities was as follows: San Francisco, 375,000; Los Angeles, 290,000; Oakland, 80,500; Sacramento 35,000.

MINERAL PRODUCTION. California has long been notable as one of the chief States in the production of gold. From the beginning of gold mining in 1848 to Jan., 1908, records compiled by the State Mining Bureau show that gold has been produced to the value of \$1,460,513,691. Although the yearly production has fallen off from the vast totals of the first fifteen or twenty years, it shows a remarkably even rate in the value of the gold produced. In the past ten years the banner year for production was 1905 when the value of the gold mined was \$19,197,043. In the two years succeeding, the production has shown some falling off. The value for the product of 1906 was \$18,732,452, while for 1907 it was \$16,727,928. In the production of gold California is outranked

only by Colorado. Silver was produced in 1907 to the value of \$751,646, as compared with \$817,830 in 1906. The production of copper in California has shown a steady increase in the last five years. The production in 1907 was 32,602,945 pounds, valued at \$6,341,387. The production in 1906 was 28,726,448 pounds, valued at \$5,532,712. In 1905, 16,997,489 pounds were produced with a value of \$2,650,605. The total production of copper for twenty-one years has been 291,739,742 pounds, with a value of \$44,034,008. Almost the entire quicksilver output of the country comes from California. In 1907 there were produced 17,431 flasks of 75 pounds each, valued at \$602,544. In 1906, 20,310 flasks were produced, valued at \$730,808. The decrease in hydraulic mining of gold and the decreased amount of gold and silver required by amalgamation process, together with the increased tendency to ship ores of the precious metals to smelters have tended to reduce the local demand for quicksilver. California ranks second among the States in the production of petroleum, being surpassed only by the Oklahoma-Kansas field, which took first rank in 1907. The production of the California field in 1907 was 39,748,375 barrels as against 33,098,598 barrels in 1906. In the value of the product California ranks sixth among the States. The oil produced in 1907 was valued at \$14,699,956. There has been great increase in the demand for crude oil for fuel purposes in the State during the last few years. During the year a new pipe line from the Midway District to Wade on the Southern Pacific, was completed by the Standard Oil Company. The price per barrel rose from 29 cents in 1906 to 37 cents in 1907. The production of mineral water in California in 1907 was 1,680,169 gallons, valued at \$460,972, an increase in quantity of 192,194 gallons, and a decrease in value of \$59,543 from the figures of 1906. California ranked fifth in 1907 as a salt producing State. Its output was 626,693 barrels or 87,737 short tons, valued at \$302,940. This is a decrease of 180,095 barrels or 25,213 short tons, as compared with the production in 1906. The value, however, increased \$11,412 over the value of 1906. The production of building and other stone is one of the most important industries of the State. In 1907, granite was produced to the value of \$1,326,324; trap rock, to the value of \$1,029,749; sandstone, \$437,738; marble, \$183,285; limestone, \$177,333, or a total value of all stone products of \$3,134,429. California ranks eighth among the States in the production of stone. A great proportion of the asphalt produced in the United States was derived from California. In 1907, 79,718 tons were produced, valued at \$1,058,400, as compared with 77,756 tons, valued at \$777,560 in 1906. California ranks eighth among the States in the production of clay products. There were produced in 1907, products of clay to the value of \$5,740,037, as compared with products to the value of \$4,364,230 in 1906. Precious stones are mined more extensively in this State than in any other State in the Union.

Mining conditions in California were somewhat improved during 1908 over 1907, and it was estimated that an important increase in output would be shown. In 1907 there was a decided falling off in the gold yield as compared with

the previous year. Twelve new dredges were installed for placer mining, and commenced operations in 1908. There were during the year seventy dredges operating in the gold fields of the State. The largest production of the silver output of the State is derived from copper smelting operations, though a considerable amount comes from quartz and placer mining. Smelters that were idle in 1907, became active in 1908, so that it is possible that a larger silver yield will result. This is true also of copper. The lead output may show a decided increase, but a diminished zinc yield is expected. Notwithstanding the drought which affected the quartz and placer mining of the State materially, the final figures of gold, silver, copper and lead production for California in 1908 are expected to show a general increase as compared with the total yield in 1907. The estimates of the Director of the Mint gives the California output of gold in 1908 as \$19,581,570, as compared with \$16,853,500 in 1907.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal crops in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 1,600,000 bushels, valued at \$1,408,000, from 50,000 acres; winter wheat, 11,680,000 bushels, valued at \$11,914,000, from 800,000 acres; oats, 6,700,000 bushels, valued at \$4,489,000, from 200,000 acres; barley, 25,427,000 bushels, valued at \$18,816,000, from 1,082,000 acres; rye, 792,000 bushels, valued at \$697,000, from 66,000 acres; potatoes, 5,243,000 bushels, valued at \$4,037,000, from 49,000 acres; hay, 817,000 tons, valued at \$10,825,000, from 605,000 acres. As compared with 1907 there was a decrease in the production of corn which in that year was 1,836,000 bushels and in winter wheat, of which 20,520,000 bushels were produced. The barley also fell off in production, the crop in 1907 being 30,056,000 bushels. The rye crop also showed substantial decrease, the production in 1907 being 1,250,000 bushels. Hay also fell off in the amount produced, which in 1907 was 1,115,000 tons. The decrease in the wheat acreage has gone on almost continuously since 1900, the acreage in 1907 being considerably less than half the maximum acreage of 1893. The acreage in wheat in 1908 declined considerably from that of 1907, which was 1,368,000. In the production of barley the State ranked second in 1907. The production of citrus fruits has steadily increased in the last few years. The State ranks second in the production of beet sugar. The estimated product in 1908 was 91,400 long tons. The number of farm animals on Jan. 1, 1909, was as follows: Horses, 412,000; mules, 83,000; milch cows, 430,000; other cattle, 1,155,000; sheep, 2,325,000; swine, 562,000. In recent years there has been a decrease in the number of sheep in the State. The estimated value of the wool clip in 1908 was \$1,854,000.

MANUFACTURES. Between the census of 1900 and that of 1905 California made very considerable progress in manufacturing. The census of 1905 covered only those establishments classed as factories, but in these there was an increase in the average number of wage-earners employed from 77,224 in 1900 to 100,355 in 1905, and in the value of products from \$257,385,000 in 1900 to \$367,218,000 in 1905. This was an increase in the number of wage-earners of 30 per cent.,

and in value of products of 29.9 per cent. It is worthy of note that only 1583 of the wage-earners in 1905 were children under 16, and only 14,084 were women. In the canning and preserving of fruits and vegetables California far surpasses any other State. This industry rose from third rank among the State's industries in 1900 to first rank in 1905. In the latter year it reported 167 establishments, 7138 wage-earners, and products valued at \$23,809,988. The increase in the latter item in five years was 77 per cent. Of the total value of production in 1900, \$7,340,059 was credited to canned fruits and only \$2,911,520 to dried fruits; in 1905, however, the canned fruits were credited with only \$6,978,083 and the dried with \$13,800,601. The principal fruits canned were peaches, apricots, and pears; and those dried were raisins, prunes, peaches, and apricots. Other leading industries, with the value or products of each in 1905, and in parentheses the percentage of increase in value since 1900 were as follows: Flour and grist-mill products, \$20,202,542 (54.9 per cent.); lumber and timber products, \$18,275,891 (57.7 per cent.); slaughtering and meat packing, \$21,795,694 (38.7 per cent.); printing and publishing, \$17,400,953 (81 per cent.); planing mill products, \$13,903,483 (189 per cent.); railway shop work, \$9,836,332 (30 per cent.); tanned, curried and finished leather, \$8,072,257 (9 per cent.); cheese, butter and condensed milk, \$7,820,937 (118 per cent.); malt liquors, \$7,510,958 (48.5 per cent.); vinous liquors, \$6,688,620 (69 per cent.); tinsmithing, coppersmithing, and sheet-iron working, \$5,937,821 (12.5 per cent.); refining petroleum, \$5,748,598 (721 per cent.). San Francisco was credited with three-eighths of the total value of manufactured products in 1905, or \$137,788,233, and with an increase of 28.7 per cent. in the value of its product since 1900. At the same time Los Angeles was credited with 9.4 per cent. of the total value, or \$34,814,475, with an increase of 130 per cent. during the five years.

EDUCATION. The total number of school census children in the State at the close of the fiscal year ending June 30, 1908 was 457,048, a gain over the same period in 1907 of 22,443. There were enrolled in the primary, grammar, evening, kindergarten, and high schools of the State 347,193 pupils. There were in these schools 10,222 teachers, of whom 911 were men. The average length of school term in 1908 was 192 days in the high schools, and 171 days in the lower schools; the average expense for education in the high schools per pupil, was \$68.09, while in the elementary schools it was \$25.91. The total expenditure for public education during the year was \$14,422,704.87. This includes expenditures for kindergarten, evening schools, primary, grammar and high schools, but does not include expenditures for the State Polytechnic School, the reform schools, the normal schools, of which there are five, and the University of California. The valuation of schoolhouses, sites, libraries, etc., in 1908 was \$34,738,533. The public schools have in their libraries 1,959,983 volumes; each school district has a stated sum to expend for books each year. The high schools in the State have made great gains in the last few years, since the provision for State aid to each school, which in 1908 amounted to \$652.28 per school, and \$10.50 per pupil in average daily attendance, one-third of the money being apportioned to the school on the basis of its

being a school, and two-thirds on the average daily attendance.

FINANCE. The report of the State Treasurer showed a balance at the close of the fiscal year, ending June 30, 1907 of \$7,149,904.24. The receipts during the fiscal year, ended June 30, 1908 were \$15,514,801.47. The expenditures for the same period were \$15,359,659.75, leaving a balance on hand June 30, 1908 of \$7,305,045.96. The State trust funds on deposit in banks on June 30, 1908, amounted to \$3,668,150. The receipts from the county treasurers for the fiscal year 1908 were \$9,267,046.33. Of this \$4,368,579.12 was for the general fund; \$3,970,726.56 for the school fund; \$348,863.97 for the State University fund, and \$139,515.69 for the interest and sinking fund. The legislators at the session of 1907 passed an act permitting the deposit in banks of money belonging to the State. The amount of interest on deposits collected to June 30, 1908 was \$48,890.09. The amount of the deposits at the end of the year was \$4,257,350.

CHARITIES AND CORRECTIONS. The average population of the State institutions for the year ending June 30, 1908, was as follows: Asylum for the Insane at Stockton, 1849; at Napa, 1690; at Agnew, 718; at Ukiah, 780; at Patton, 996; Home for Feeble Minded Children at Eldridge, 655; Institution for the Deaf and Blind at Berkeley, 206; Home for Adult Blind at Oakland, 110; State Reform School at Whittier, 300; Preston School of Industry, at Lone, 292; Folsom State Prison, 1992; San Quentin State Prison, 1620. The county hospitals and almshouses had, on June 20, 1908, 1528 inmates, and the county jails had on the same date, 1384 inmates. There were admitted to the county hospitals during the year ending June 30, 1908, 17,494 persons, and there were admitted to the county jails during that year, 22,838 persons. The total cost of maintaining the State institutions for the fiscal year was \$1,929,758. Of this, \$1,042,229 was expended for the maintenance of the State insane hospitals.

POLITICS AND GOVERNMENT. There was no meeting of the State Legislature in 1908, and no elections for State officers. The legislature of 1907 provided for submission to the vote of the people an amendment providing for a direct primary law. This amendment was adopted at the election of Nov. 3. The troubles between the Japanese and the natives in San Francisco which became acute in 1907, had so far subsided in 1908 as to become insignificant. There was a slight outbreak in Napa, in April, when a Japanese laundryman was assaulted by a mob of men and boys. The suit of the Japanese residents against the City and City Council of San Francisco to recover damages for mob violence on May 20, 1907, was settled on Mar. 26 by a compromise, by which judgment for the Japanese was found for \$450. In January, the California State Commission undertook an investigation of the Southern Pacific, the Santa Fe and the Salt Lake Route railroads to see if violations had been made of the law against rebating by railroads. A note of the visit of the fleet of the United States Navy on its Pacific cruise to California ports will be found in the paragraph *Navy*, in the article UNITED STATES.

SAN FRANCISCO. The prosecution against city officials and others for alleged corruption received a severe blow on Jan. 9, when the three Justices of the District Court of Appeals

handed down a decision setting aside the judgment of the lower court in the French restaurant case, on which Eugene F. Schmitz, the former mayor, was convicted on June 13, 1907, and sentenced to five years' imprisonment in the State penitentiary. Schmitz had been found guilty on evidence that he had shared in "fees" paid to Abraham Ruef by the proprietors of certain restaurants, in return for which they were permitted to carry on illegitimate business. Ruef had pleaded guilty to the charge of extorting these "fees" from restaurant keepers. According to the decision of the Appellate Court the compelling of the French restaurants to pay these "fees" by Ruef was not a crime according to the laws of the State, even though he shared them with Schmitz. The judges declared further that the indictment against Schmitz was invalid because it contained no allegation of a threat to injure property, and did not charge any threat to do unlawful injury. To threaten to hold up the license of these persons, or to do so actually, declared the court, was not an unlawful act. The court also criticised the conduct of the trial and commented adversely on rulings made by Judge Dunne, who presided. The effect of this decision was to invalidate the four remaining charges for extortion against Ruef and Schmitz, and to render void the confession of Ruef, as the facts which he confessed were decided not to be criminal.

There still remained against Schmitz about forty indictments for bribery, and against Ruef 126 indictments, charging the same crime. The prosecution appealed to the State Supreme Court against this decision, but this body on Mar. 9 refused to grant a rehearing and confirmed the decision of the Appellate Court that the offense charged was not a felony, in a legal sense. On Mar. 21 the remaining indictments for extortion pending against Schmitz were dismissed, and he was released on bail, awaiting trial on other charges. The trial of Ruef also failed on this technicality.

Following the decision of the Appellate Court noted above, Prosecuting Attorney Langdon, on Jan. 19, announced that Abraham Ruef would be put on trial on one of the charges of bribery pending against him. At the same time he made public a contract made with Ruef in May, 1907, by the terms of which the latter was to receive almost complete immunity from prosecution, in consideration of his giving evidence against each and every defendant brought to trial in the graft cases. This immunity did not apply to the Schmitz case, then on trial, in which it was agreed that Ruef was to plead guilty. Mr. Langdon asserted that Ruef did not live up to his agreement when Tirey L. Ford, counsel for the United Railways, was tried for and acquitted of bribery in Dec., 1907. In declaring this immunity void, the prosecution asserted that it was moved to take this action by Ruef's failure to keep his agreement, and by the absolute refusal of Judges Dunne and Lawlor to countenance any immunity.

On Mar. 26 three additional indictments were found against Ruef and also against Patrick Calhoun, president of the United Railways, and Tirey L. Ford, general counsel of the same corporation. Ford, who had been tried twice before, one trial resulting in a disagreement and one in an acquittal, was ac-

quitted on a third indictment on May 2. Other indictments were pending. Ruef was again placed on trial, this time on an indictment charging him with the bribery of Phillips, one of the former supervisors, in connection with the trolley franchise. This trial ended on May 21 with a disagreement by the jury, which held that Ruef and the supervisors were accomplices, and therefore the testimony of the latter against Ruef could not be accepted. On July 6, Ruef, who for six months had been held in the common jail, secured bail of \$1,500,000, and was set at liberty in spite of the efforts of the prosecution to prevent such action. Public sentiment in San Francisco, which at the beginning of the graft prosecutions in 1907, had been strongly in sympathy with the movement, for various reasons, became, during 1908, lukewarm, and in some instances, hostile. This was due in part to certain methods employed by the prosecutors to secure evidence, and in part to their attempts to fasten crime upon prominent business men of the city. The position of Rudolph Spreckels, under whose financial support the prosecution was undertaken and carried on, became increasingly difficult. On July 21, President Roosevelt sent him a letter which, in part, read as follows:

"Now and then you and Mr. Heney and the others who are associated with you must feel downhearted when you see men guilty of atrocious crimes who, for some cause or other, succeed in escaping punishment, and especially when you see men of wealth, of high business and, in a sense, of high social standing, banded together against you. My dear sir, I want you to feel that your experience is simply the experience of all of us who are engaged in this fight. There is no form of slander and wicked falsehood which will not as a matter of course be employed against all men engaged in such a struggle.

"Now, I do hope that you and your colleagues will treat all this bitterness with entire disregard. It is of small consequence to you or to any of us who are engaged in this work, whether men think well or ill of us personally; but it is of very great consequence that we should do the work without flinching, on the one hand, and on the other hand, without losing our good humor and common sense, without becoming angered and irritated to a degree that will in any way cause us to lose our heads.

"You have heart-breaking difficulties with which to contend. You have to fight not only the banded powers of evil, but, alas! that it should be said, the supineness and indifference of many good men whose zealous support you had a right to feel you could rely upon. Do not be discouraged; don't flinch. You are in a fight for plain decency—for the plain democracy of the people who believe in honesty and in fair dealing as between man and man. Do not become disheartened. Keep up the fight."

On August 19, Ruef was again held for trial. The case was the alleged bribery of Furey, a former supervisor, to vote for the granting of an overhead trolley franchise to the United Railways. On Oct. 29, E. A. S. Blake, who had been convicted of attempting to bribe a member of the jury, confessed in court that he carried an offer from one of Ruef's attorneys to pay \$1000 if the juror voted for acquittal. The juror told the district attorney, and as a result, Blake

was convicted. After his conviction he testified that the attorneys of Ruef offered him \$10,000 if he would keep silence. On Nov. 13, Francis J. Heney, who was prosecuting the case against Ruef, was shot, during a recess of the court, by one Morris Haas, a saloon keeper, whom Heney had rejected as a juror on account of his criminal record. The shot was not fatal, and Mr. Heney recovered within a few weeks. Haas committed suicide in jail, on Nov. 16, by shooting himself. As a result of the shooting of Heney, and the consequent arousing of public feeling, Ruef's bail was cancelled and he was again committed to jail. His trial was resumed on Nov. 16. The jury rendered a verdict of guilty on Dec. 10. On Dec. 29, Ruef was sentenced to fourteen years' imprisonment and steps were at once taken by his attorneys to appeal the case to higher courts. It was announced that the trial of Patrick Calhoun, the head of the United Railways, would begin on Jan. 5.

The rebuilding of the city was carried on on a large scale during 1908. The business edifices constructed are much larger than those which existed previous to the fire of 1906. The population lost at the time of the fire was practically regained by the end of 1908. For measures taken to stamp out the bubonic plague in the city, see PLAGUE.

The final accounts of the relief fund, contributed for the relief of the sufferers from the fire and earthquake of April, 1906, were published on Dec. 27. A total of \$9,000,000 was expended, and the balance of the funds on hand was \$397,267. This was turned over to the hospitals and charitable institutions of San Francisco. The relief corporation provided and assisted in providing for about 8,000 homes in San Francisco or shelter for 30,000 persons at a cost of \$1,900,000. Most of the structures built were of a permanent character. A home for the aged and infirm was built and presented to the State at a cost of \$374,567.

CONVENTIONS AND ELECTIONS. In the Republican State Convention, held on May 14, for the selection of delegates to the National Convention, the delegates at large were instructed to vote for W. H. Taft for president. The Democratic Convention for the same purpose was held on May 19, and the delegates were instructed for W. J. Bryan for president. In the election of Nov. 3, the vote was as follows: Taft, 214,398; Bryan, 127,492; Chafin, 11,770; Debs, 28,659.

STATE OFFICERS. Governor, Jas. N. Gillett; Lieutenant-Governor, Warren Porter; Secretary of State, C. F. Curry; Treasurer, W. R. Williams; Comptroller, A. B. Nye; Adjutant-General, J. B. Lauck; Attorney-General, V. S. Webb; Superintendent of Education, Ed. Hyatt; Commissioner of Insurance, E. Myron Wolfe; Commissioner of Lands, W. S. Kingsbury—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, W. H. Beatty; Associate Justices, H. Melvin, Lucien Shaw, F. M. Angellotti, Lucien Sloss, F. W. Henshaw, W. G. Lorigan; Clerk, F. L. Caughey—all Republicans.

The legislature of 1909 is composed of 30 Republicans and 10 Democrats in the Senate, and 60 Republicans, 18 Democrats and 18 Labor Unionists in the House. The representatives in Congress will be found in the article UNITED STATES, section Congress.

CALIFORNIA, UNIVERSITY OF. An institution of higher learning at Berkeley and San Francisco, Cal., founded in 1868. There

are 23 regents, six of them ex-officio State officers, the remainder appointed by the Governor and approved by the Senate. In addition to ten colleges at Berkeley, the University includes colleges of law, medicine, dentistry, and pharmacy, and an institute of art at San Francisco, the Marine Biological Laboratory at San Diego, and the Lick Observatory at Mount Hamilton. All of the colleges require for entrance high school graduation, except the Medical Department, which requires the previous completion of two years in college, and the course in law leading to the degree of J. D., which requires the previous completion of three years. The College of Agriculture includes the U. S. Agricultural experiment station, with sub-stations in various parts of the State and an elaborate system of bulletins and reports, and the University Farm at Davis, Yolo county. The University conducts also a summer session, a department of university extension, and issues seventeen series of departmental publications. The attendance in 1907-08 was 3,859. In Arts there were 1,453 students, two-thirds of them women. In Applied Science, 827; 324 graduate students; 177 in Commerce; 132 in Agriculture; 180 in Art. All of the other departments registered less than one hundred students. The endowment of the University was \$4,121,800 (June 30, 1908). The annual income was \$1,182,400, for the year ending June 30, 1908, of which 55.68 per cent. came from the State. No tuition is charged to students of California. Non-residents of California pay \$20 a year. The most notable buildings are the Hearst Memorial Mining Building, cost, \$644,000; California Hall, \$264,000, and the Doe Library, \$650,000, all built of white granite, in modern fireproof construction, and the Greek Theatre, the gift of Wm. Randolph Hearst, an open-air theatre, holding 8,000 persons; all building operations are in accordance with the Phœbe S. Hearst Plan, secured by an international architectural competition. All departments are open to women. Military drill is required of the men undergraduates in the freshman and sophomore classes. The library contains 225,000 volumes and 100,000 manuscripts. Benj. Ide Wheeler has been president since 1899.

CAMBODIA. A French protectorate in Indo-China. Area, about 37,400 square miles, exclusive of the cessions made by Siam in 1904 and 1907, embracing about 16,000 square miles (see FRENCH INDO-CHINA). The population was estimated in 1906 at 1,237,864, including 250,000 Chinese, 40,000 Malays, and a few hundred Europeans. Four-fifths of the population live in the riverine country. Pnom-Penh, the capital, has 46,000 inhabitants. The agricultural products include rice, maize, betel-nuts, sugar, coffee, tobacco, cinnamon, silk, etc. Cambodia is the principal centre of cotton production in Indo-China. Cotton is cultivated along the banks of the Mekong, and is of longer fibre than the East Indian variety. The whole production is exported. The industry is managed by Chinese, who make advances to the cultivators on their crops. There was one cotton-ginning mill, erected by a Frenchman, provided with American machinery, worked by a French engineer, and owned by a Chinaman. The product is shipped to Japan. The pepper production amounts to 1,700,000 pounds annually. The number of cattle is reported to be 350,000. The imports and exports, included in those of

French Indo-China, pass mainly through Saigon, Cochin-China. There is a French Superior Resident at the capital. King Lisowath ascended the throne in 1904. The local budget for 1908 balanced at 2,582,000 dollars (1 dollar = about 42½ cents).

CAMERUN. See KAMERUN.

CAMPAIGN, PRESIDENTIAL. See PRESIDENTIAL CAMPAIGN.

CAMPBELL, LEWIS. A Scotch Greek scholar and educator, died on Oct. 25, 1908. He was born in Edinburgh on Sept. 3, 1830, and was educated at Glasgow University, at Trinity College, Oxford, (where he was awarded a scholarship) and at Balliol. In 1855 he became a fellow at Queen's College, (Oxford), and he was a tutor there in 1856-58, when he became vicar of Milford, where he remained until 1863, in which year he was called to the chair of Greek at St. Andrews, where he taught until his retirement in 1892. An LL.D. of Glasgow and a D.Litt. of Oxford, Campbell was a combination of the old type of British scholarship—so wide were his interests—and of the new—so thoroughly was he master of Plato and Sophocles. With W. Garnett he wrote (2nd ed., 1884), a *Life of Clerk Maxwell*, the physicist. He edited Jowett's *Theological Essays* (1906) and Jowett's *Epistles of St. Paul* (3rd ed., 1895), and with Evelyn Abbott Jowett's *Letters* (1898). Abbott and Campbell wrote the excellent *Life of Jowett* (1897). With Jowett, Campbell had edited Plato's *Republic* (1894); and with Abbott, he edited *Sophocles* (1886), an abridgement of his greatest work, an edition of *Sophocles* (1879-81). He edited Plato's *Sophistes*, *Politicus* and *Theætetus*. His metrical version of *Sophocles* (1883) is superior to Plumptre's; and Campbell's translation (1900) of *Æschylus* in English verse is equalled only by Jebb's. Among his other important works are: *A Guide to Greek Tragedy* (1891), *Religion in Greek Literature* (1898), and *Tragic Drama in Æschylus, Sophocles and Shakespeare* (1904).

CAMPBELL-BANNERMAN, Sir HENRY. A British statesman, Prime Minister from 1905 to 1908, died in London on April 22, 1908. He was born at Stracathro in Scotland on Sept. 7, 1836, the son of Sir James Campbell. He assumed the name Bannerman in 1872 in accordance with the will of an uncle. He graduated at Trinity College, Cambridge, in 1858, and entered Parliament in 1868 as Liberal representative of the Stirling Burghs, which he continued to represent until his death. He was Financial Secretary of the War Office in the Gladstone government in 1870-74 and again in 1880-82; Secretary to the Admiralty in 1880-84, and Chief Secretary for Ireland in 1884-85. He was Secretary of State for War in the short-lived Liberal ministry of 1886, and likewise from 1892 to 1895 during the administrations of Mr. Gladstone and Lord Rosebery. In 1899 he was elected leader of the Liberal party in succession to Sir William Vernon Harcourt, and after the Liberal victory of 1905 became Prime Minister. He resigned April 5, 1908, because of failing health. His party leadership of the minority first fell in the difficult days of the Boer War, his opposition to which caused a break in the party, which it took some years to repair. The chief achievement of his administration was the establishment of respon-

sible government in the Transvaal. A contest with the peers was precipitated by their amendment of the Education Bill and was left as a legacy to his successor. Sir Henry, or "C.-B.," as he was familiarly known, was a man of kindly personality and great tact as a party leader, but of indomitable steadfastness in matters of principle. See GREAT BRITAIN.

CAMPBELLITES, or **CAMPBELL BAPTISTS**. A name sometimes applied to the Disciples of Christ (q. v.).

CAMPHOR. See FORMOSA.

CANADA, DOMINION OF. A British possession in North America. Its area, exclusive of the Canadian portion of the Great Lakes, the Gulf of St. Lawrence, and territorial seas, and population (1901), by provinces, are as follows:

	Area, sq. miles	Pop- ulation 1901
Prince Edward Island ..	2,184	103,259
Nova Scotia	21,428	459,574
New Brunswick	27,985	331,120
Quebec	351,873	1,648,898
Ontario	260,862	2,182,947
Manitoba	73,732	255,211
British Columbia	312,630	178,657
Alberta	253,540	72,841
Saskatchewan	250,650	91,460
Territories	1,922,735	158,940
Totals	3,745,574	5,371,315

Alberta and Saskatchewan were formed into provinces in 1905, and their population as given above was that contained in 1901 within their present limits. The population of Canada in 1901 consisted of 2,751,708 males and 2,619,607 females. The natives of Canada numbered 4,671,815; of the British Islands, 390,019; of British possessions, 15,864 (12,432 of Newfoundland); of Austria-Hungary, 28,407; China, 17,043; France, 7,994; Germany, 27,300; Iceland, 6,057; Italy, 6,854; Japan, 4,674; Norway and Sweden, 10,256; Russia, 31,231; United States, 127,899. The religious and denominations most numerously represented in 1901 were: Roman Catholic, 2,229,600; Methodist, 916,886; Presbyterian, 842,442; Anglican, 680,620; Baptist, 316,477; Lutheran, 92,524; Mennonite, 31,797; Congregational, 28,293; Greek Catholic, 15,630; Disciples, 14,900; Dukhobor, 8,775; Jewish, 16,401; Buddhist, 10,407; Confucian, 5,115; Pagan, 15,107; Agnostic, 3,613. The population classed as rural numbered 3,349,516 in 1901, and as urban, 2,021,799. The number of Indians in 1901 was 99,010.

A special census of the Northwest Provinces in 1906 gives Manitoba a population of 808,863 (466,257 males, 342,606 females); Alberta, 185,412 (108,283 males, 77,129 females); and Saskatchewan, 257,763 (152,791 males, 104,972 females). The cities having over 10,000 inhabitants in 1901 were as follows (the 1906 figures being for cities in the Northwest Provinces): Brandon (1906), 10,408; Brantford, 16,619; Calgary (1906), 11,967; Charlottetown, 12,080; Edmonton (1906), 11,167; Guelph, 11,496; Halifax, 40,832; Hamilton, 52,634; Hull, 13,993; Kingston, 17,961; London, 37,976; Mile End, 10,933; Montreal, 267,730; Ottawa, the capital of the Dominion, 59,928; Peterborough, 11,239; Quebec, 68,840; Ste. Conégonde, 10,912; St. Henri,

21,192; St. John, N. B., 40,711; St. Thomas, 11,485; Sherbrooke, 11,765; Toronto, 208,040; Valleyfield, 11,055; Vancouver, 27,010; Victoria, 20,816; Windsor, 12,153; Winnipeg, 42,430 (1906, 90,153).

The number of immigrants into Canada in 1906-07 (9 months) was 252,038; in 1907-08, 262,469. In the latter year, 120,182 were British and 58,312 American. The total immigration during the nine fiscal years 1900-1908 was 1,097,689 (449,363 British and 333,760 American). At the beginning of 1908 the Immigration Department took steps to restrict all immigration likely to congest the labor market during the industrial depression. The total number of arrivals at the ocean ports during the first 9 months of 1908 was 81,977, against 191,020 during the same period in 1907. The immigration from the United States during the same period was 45,653, against 44,809 during the same period in 1907. The total immigration during the 9 months was 127,630, against 235,829 during the same period in 1907.

EDUCATION. There is no centralized system of education, which is controlled exclusively by the Provinces. In Alberta and Saskatchewan school attendance is compulsory between the ages of 7 and 12 years inclusive, for at least 16 weeks each year, eight of which must be consecutive. In British Columbia education is compulsory between the ages of 7 and 14 years for six months each year. In Manitoba education is free up to 16 years of age, but not compulsory. In New Brunswick education is compulsory from 7 to 12 years of age. In Nova Scotia education is nominally compulsory between the ages of 6 and 16 years of age for at least 120 days each year, but exceptions are numerous from the 12th year. In Ontario education is compulsory between 8 and 14 years of age for the full term of each year. In Quebec the payment of the fees of school children is compulsory, but attendance is not compulsory. The policy of the Provinces also varies in regard to the relation of religion to the schools. In Quebec the council of public instruction is divided into Protestant and Catholic committees, the latter being composed of bishops, and the schools for the two sects are entirely distinct. In Ontario, Alberta, and Saskatchewan also there are separate schools for Catholics. In Manitoba there are no separate schools, but religious instruction may be given to the pupils whose parents demand it. In the other Provinces the schools are non-sectarian. The school expenditure is met by provincial grants and local taxation, the latter averaging over two-thirds of the total for all the provinces. Following are some leading details respecting the primary and secondary schools in the various provinces:

In Alberta there were, in 1907, 694 schools, of which 8 were Roman Catholic separate, with 426 teachers and 34,338 pupils. The total expenditure was \$1,894,791. The provincial normal school had 97 students in course of the year.

In British Columbia there were, in 1906-7, 15 high and 373 elementary schools, with 735 teachers and 30,039 pupils (1,355 in high schools). The total expenditure for the year was \$864,771. The provincial normal school had 58 students.

In Manitoba there were, in 1907, 1,943 schools with 2,480 teachers and 67,144 pupils. Included in the above were 7 high schools with 3,870

pupils. The total expenditure for the year was \$2,729,917. The provincial normal school had 128 students, besides 272 special students.

In New Brunswick there were in 1906-7, 1,766 schools, with 1,874 teachers, and 66,422 pupils. The number of high school pupils, included in the above, was 1,913. The normal school had 341 students in 1907-8. The University of New Brunswick had 147 students in 1907-8.

In Nova Scotia there were, in 1907, 2,465 schools, with 2,626 teachers and 100,007 pupils (7,646 in high schools). The total expenditure for the year was \$1,040,805, of which \$277,416 was contributed by the province.

In Ontario there were, in 1907, 5,819 public schools, with 8,859 teachers (exclusive of kindergarten and night school teachers), and 396,716 pupils; 449 Roman Catholic separate schools, with 1034 teachers and 51,502 pupils; 5 Protestant separate schools with 326 pupils; 145 kindergartens, with 15,242 pupils; 20 night schools, with 1,552 pupils; 143 high schools, with 750 teachers and 30,331 pupils; and 120 continuation schools, with 5,317 pupils. The total expenditure was \$8,769,876. The proportion of the expenditure paid by the province was 9.28 per cent.; by local taxation, 82.9 per cent.; and from other sources, 7.82 per cent.

In Prince Edward Island there were, in 1907, 479 schools, with 572 teachers and 19,036 pupils. The total expenditure was \$170,327.

In Quebec there were, in 1906-7, 5,592 elementary schools, with 6,630 teachers and 209,880 pupils; 627 model schools, with 92,918 pupils; 198 academies, with 44,818 pupils; 6 normal schools, with 467 students; 7 schools annexed to normal schools, with 1,003 pupils; 19 Roman Catholic classical colleges, with 6,268 students; 4 universities, with 2,468 students; a school of art and design, with 2,257 students; 57 night schools, with 6,140 pupils; and 4 schools for the deaf, dumb, and blind, with 537 pupils. There are separate Roman Catholic and Protestant elementary schools, model schools, and academies. The total school revenue was \$4,591,391, of which \$1,517,741 was from fees from subsidized institutions, \$540,650 contributed by the province, and the remainder from local taxation.

FISHERIES. The value of the total yield of the fisheries of Canada in 1905 was \$29,479,562; in 1906, \$26,279,485. The fish representing the highest values in 1906 were: Dried cod, \$3,353,875; fresh halibut, \$683,840; fresh herring, \$771,474; salted herring, \$1,534,336; smoked herring, \$3,704,403; fresh lobsters, \$400,748; preserved lobsters, \$2,522,179; fresh mackerel, \$588,603; salted mackerel, \$781,125; pickerel, \$713,437; fresh salmon, \$1,229,162; preserved salmon, \$3,778,606; dry salted, pickled, and smoked salmon, \$848,992; trout, \$791,467; whitefish, \$906,750. The value of fur sealskins was \$316,224. The total values of the catch of the various provinces in 1906 were: British Columbia, \$7,003,347; Manitoba and Territories, \$1,492,923; New Brunswick, \$4,905,225; Nova Scotia, \$7,799,160; Ontario, \$1,734,856; Prince Edward Island, \$1,168,939; Quebec, \$2,175,035. The distribution of fry from the Dominion hatcheries in 1907 amounted to the number of 813,979,350. Bounties amounting to \$156,113 were paid by the Dominion in 1907 to 25,920 fishermen. The total expenditures of the Dominion on fisheries

amounted to \$693,685, including \$204,837 on the protection service. Exclusive of the lobster fisheries, the Canadian fisheries employed in 1907, 76,100 men and 1,430 vessels or 40,827 tons, valued at \$2,841,875.

MINING AND METALS. The total value of the mineral and metal production of Canada in 1908 was approximately \$87,323,849, against \$86,842,765 in 1907. The approximate quantities and values of the principal mineral products of Canada in 1908 are shown in the following:

	Quantity	Value
Asbestos, tons	65,534	\$2,547,507
Portland cement, bbls...	2,665,289	3,709,063
Coal, tons	10,904,466	25,567,235
Copper, lbs.	64,361,636	8,500,885
Corundum, tons	1,039	100,389
Gold		9,559,274
Gypsum, tons	340,964	575,701
Lead, lbs.	45,725,886	1,920,487
Mica		191,602
Natural gas		1,012,060
Nickel, lbs.	19,143,111	8,231,538
Petroleum, bbls.	527,987	747,102
Pig Iron (from Canadian ore), tons	99,420	1,664,302
Pyrites, tons	47,336	224,824
Salt, tons	79,975	378,798
Silver, ozs.	22,070,212	11,667,197
Sewer pipes		514,042

The total pig iron production in 1907 was 581,146 tons; in 1908, 563,672 tons. Nearly three-fourths of the cement output came from the vicinity of Owen Sound, Ontario, where the plants were employed to their full capacity, owing to the demand for concrete material for building the transcontinental railroad. The gold production in 1906 was valued at \$11,495,201, as compared with \$8,264,765 in 1907 and \$9,559,274 in 1908. The falling off in 1907 amounted to about 29 per cent. The production in Yukon alone fell from \$5,257,739 in 1906 to about \$3,150,000 in 1907, but increased to about \$3,600,000 in 1908. The production of petroleum is practically all derived from the Ontario peninsula, and has been estimated on the basis of the bounty of 1½ cents per gallon paid by the Dominion government. The total bounty paid in 1908 was \$277,193. About 440 wells were producing natural gas in 1907, of which 114 were bored during the year.

The following information is obtained from Provincial reports: In British Columbia in 1907 the total mineral production amounted to \$25,882,560, against \$24,980,546 in 1906. The production of placer gold was 41,450 ounces, valued at \$828,000 (in 1906: \$948,400); lode gold, 196,179 ounces, \$4,055,020 (in 1906: \$4,630,639); silver, 2,745,448 ounces, \$1,703,825; lead, 47,738,703 pounds, \$2,291,458; copper, 40,832,720 pounds, \$8,166,544; coal, 1,800,067 long tons, \$6,300,235; coke, 222,913 tons, \$1,337,478; other minerals, \$1,200,000. Compared with 1906, all the metals show a falling off both as to quantities and values, while coal and coke show an increase in both respects. The total mineral production of British Columbia from 1852 to 1907 inclusive amounted to \$299,526,282.

The principal mineral products of Nova Scotia during the year ended Sep. 30, 1907, were as follows: Coal, 5,730,660 tons; coke, 493,102

tons; pig iron, mostly from imported ores, 293,436 tons; limestone, 458,601 tons; gypsum, 332,345 tons; gold, 15,006 ounces; cement, 58,762 barrels.

The mineral and metal production of Ontario in 1907 was valued at \$25,019,373—the highest on record and showing an increase of 12 per cent. over 1906. The total number of employees was 13,613, who received \$7,747,195 in wages. The values of the principal mineral and metal products were: Gold, \$66,399; silver, \$6,157,871; cobalt, \$92,751; nickel, \$2,271,616; copper, \$1,045,511; iron ore, \$482,532; pig iron (286,216 tons), \$4,716,857; brick and tile, \$3,082,057; building and crushed stone, \$675,000; Portland cement, \$2,777,478; corundum, \$242,608; lime, \$418,700; crude petroleum, \$1,049,631; salt, \$432,936; sewer pipe, \$435,088. The value of the output of the Cobalt District in 1908 was about \$9,500,000.

With the exception of a small output in Vermont and Georgia, Quebec supplies the bulk of the asbestos produced on the North American Continent. In 1908 a new asbestos field was discovered near Eastman, Quebec, 65 miles from the Danville mines and 100 miles from the Thetford, Black Lake, Broughton, and other mines.

There are about 37,000 square miles of peat bogs in Canada, of which 25,000 square miles are in Alberta, Saskatchewan, and the Territories, and 10,000 square miles in the Moose River basin of Ontario.

AGRICULTURE. The area, production, and value of the field crops of the Dominion, excepting British Columbia, in 1908 were as follows:

Field crop.	Area	Yield	Value
	Acres.	U. S. Bushels.	Dollars.
Fall wheat	770,400	19,390,419	16,253,000
Spring wheat	5,839,900	96,586,939	74,975,000
Oats	7,941,100	258,267,631	96,489,000
Barley	1,745,700	48,235,704	21,353,000
Rye	100,350	1,764,922	1,262,000
Peas	412,900	7,282,496	5,970,000
Buckwheat	291,300	7,378,427	4,215,000
Mixed grains	581,900	19,649,329	10,140,000
Flax	139,300	1,546,241	1,457,000
Beans	60,100	1,284,236	1,988,000
Corn for husking .	366,200	23,592,811	11,837,000
Potatoes	503,600	68,796,893	34,819,000
Turnips and other roots	271,443	104,438,831	17,532,000
Hay and clover ..	8,210,900	12,824,000	121,884,000
Fodder corn	259,770	3,279,360	11,781,000
Sugar beets	10,800	122,080	578,000
Total	27,505,663	—	432,533,000

b Tons of 2,000 pounds.

The approximate value in 1908 of farm crops by provinces, excepting British Columbia, was as follows: Alberta, \$14,000,000; Manitoba, \$66,000,000; New Brunswick, \$28,000,000; Nova Scotia, \$20,000,000; Ontario \$185,000,000; Prince Edward Island, \$9,408,000; Quebec, \$80,000,000; Saskatchewan, \$37,000,000.

Agricultural censuses of Canada were taken in 1906 for the Northwest Provinces (Manitoba, Saskatchewan, and Alberta), and in 1907 for the Eastern Provinces, (Ontario, Quebec, New Brunswick, Nova Scotia, and Prince Edward Island). Some of the leading results of these censuses, together with later information available, are given in the following, by provinces:

ALBERTA. In 1906, there were 30,286 farms, against 9,433 in 1901. The acreage of all field crops was 916,100. The number of horses was 226,534; milch cows, 101,245; other cattle, 849,837; sheep, 154,266; swine, 114,623.

MANITOBA. In 1906 there were 36,141 farms, against 31,812 in 1901. The acreage of all field crops was 4,220,161. The number of horses was 215,819; milch cows, 170,543; other cattle, 350,969; sheep, 28,975; swine, 200,509.

NEW BRUNSWICK. In 1907 the total farm land cleared was 1,664,941 acres (37.79 per cent. of the occupied area), against 1,405,615 in 1901. The land in all crops was 1,087,626 acres; in orchard and garden, 16,290. The number of horses was 65,784; milch cows, 128,706; other cattle, 130,937; sheep, 250,546; swine, 97,091; poultry, 1,031,583.

NOVA SCOTIA. In 1907 the total farm land cleared was 1,834,802 acres (36.22 per cent. of the area occupied), against 1,244,275 in 1901. The land in all crops was 883,472 acres; in orchard and garden, 54,051. The number of horses was 63,418; milch cows, 143,362; other cattle, 198,861; sheep, 384,940; swine, 74,811; poultry, 1,040,467. The yield of apples in the Annapolis valley in 1908 was about 800,000 barrels.

ONTARIO. In 1907 the total farm land cleared was 14,123,742 acres (57.86 per cent. of the total area occupied), against 13,223,313 in 1901. The land in all crops was 9,764,724 acres; in orchard and gardens, 326,290. The number of horses was 725,666; milch cows, 1,152,071; other cattle, 1,774,165; sheep, 1,106,083; swine, 2,049,666; poultry, 13,428,076.

PRINCE EDWARD ISLAND. In 1907 the total farm area cleared was 760,036 acres (63.69 per cent. of the occupied area), against 724,978 in 1901. The land in all crops was 503,579 acres; in orchard and garden, 6,077. The number of horses was 34,363; milch cows, 53,096; other cattle, 61,156; sheep, 111,202; swine, 55,005; poultry, 720,787.

QUEBEC. In 1907 the total farm land cleared was 8,513,916 acres (59.02 per cent. of the occupied area), against 7,421,264 in 1901. The land in all crops was 5,250,405 acres; in garden and orchard, 77,416. The number of horses was 351,176; milch cows, 876,135; other cattle, 668,693; sheep, 626,033; swine, 729,453; poultry, 4,342,241.

SASKATCHEWAN. In 1906 there were 55,971 farms, against 13,380 in 1901. The acreage of all field crops was 3,271,436. The number of horses was 240,566; milch cows, 112,618; other cattle, 360,236; sheep, 121,290; swine, 123,916.

The export of dairy produce from Canada in 1907-8 was as follows: Butter, 4,786,954 pounds, valued at \$1,068,703; cheese, 189,710,463 pounds, valued at \$22,887,237 (\$22,763,736 to Great Britain).

British Columbia depends for its supplies of farm and dairy produce mainly upon importations from other parts of Canada as well as from foreign countries. In 1907-8 imports from foreign countries of dairy produce, meats, vegetables, fruits, hay, and living animals, amounted to \$1,865,542. This sum represented only about 26.5 per cent. of the total import of these articles. The fruit acreage in the province is extending; in 1908 it was estimated at considerably over 100,000 acres.

MANUFACTURES. The census of the manufactures of Canada, taken in 1906 and covering the year 1905, shows the following general results:

TABLE 1., STATISTICS OF MANUFACTURES FOR ALL ESTABLISHMENTS BY PROVINCES, 1905.

	Estab- lish- ments	Capital	Employee	Salaries and Wages	Value of Products
	No.	\$	No.	\$	\$
Canada	15,796	846,585,023	392,530	165,100,011	718,352,603
Alberta	120	5,545,821	2,045	1,167,107	5,116,782
British Columbia	459	53,022,033	23,748	11,413,315	38,288,378
Manitoba	354	27,517,297	10,333	5,909,791	28,155,732
New Brunswick	628	26,792,698	19,526	6,581,411	22,133,951
Nova Scotia	909	75,089,191	24,237	9,284,864	32,574,323
Ontario	7,996	397,484,705	189,370	82,415,520	367,850,002
Prince Edward I.	285	1,680,541	2,919	445,676	1,851,615
Quebec	4,965	255,479,662	119,008	47,160,452	219,861,648
Saskatchewan	80	3,973,075	1,444	721,875	2,520,172

Included in the above table are establishments employing less than five persons, which for the whole of Canada numbered 3,249, with \$12,668,868 of capital, 8,610 employees, \$2,944,433 of salaries and wages, and \$11,906,025 val-

ue of products. The statistics for the whole of Canada of establishments employing five persons and over, by groups of industries, are shown in table II.

TABLE II., ESTABLISHMENTS EMPLOYING FIVE PERSONS AND OVER BY GROUPS OF INDUSTRIES, 1905.

Kinds of Industries	Estab- lish- ments	Capital	Wage earners	Wages for Labor	Products. Value of
	No.	\$	No.	\$	\$
Total of groups	12,547	833,916,155	348,329	131,914,005	706,446,578
1. Food products	4,774	88,826,866	44,995	11,839,055	172,017,002
2. Textiles	1,432	73,758,622	55,822	17,259,210	84,370,099
3. Iron and steel products	584	60,642,516	30,187	13,767,569	52,587,051
4. Timber and lumber and their re- manufactures	2,234	148,416,643	77,968	28,952,869	109,500,970
5. Leather and its finished products.....	321	27,681,935	17,572	6,240,985	41,201,872
6. Paper and printing	606	47,863,983	19,266	8,390,804	32,773,880
7. Liquors and beverages	173	26,129,862	3,651	1,725,758	13,928,701
8. Chemicals and allied products	141	16,039,312	3,281	1,247,332	15,290,822
9. Clay, glass, and stone products.....	641	24,800,605	13,276	4,932,640	13,558,921
10. Metals and metal products other than steel	414	104,079,075	20,116	10,665,471	50,068,669
11. Tobacco and its manufactures.....	133	10,575,402	7,052	2,326,317	15,189,720
12. Vehicles for land transportation.....	291	31,076,801	22,160	10,729,814	36,911,124
13. Vessels for water transportation	51	3,409,699	1,784	763,236	1,892,253
14. Miscellaneous industries	689	169,190,960	30,093	12,605,056	65,721,741
15. Hand trades	63	1,423,874	1,106	469,889	1,433,753

The number of establishments employing five persons and over in 1905 in Canada was 12,547, against 14,650 in 1900, a decrease of 2,103. The capital employed in the manufacturing establishments (employing five persons and over) in 1905 was \$833,916,155, against \$446,916,487 in 1900, showing an increase of \$386,999,668. The average capital per establishment in 1905 was \$66,463 against \$30,506 in 1900, an increase of \$35,957. The average capital per establishment in 1905 varied considerably for the different provinces, being \$144,362 in British Columbia, \$103,610 in Nova Scotia, \$96,681 in Manitoba, \$69,472 in Saskatchewan, \$63,423 in Ontario, \$61,174 in Quebec, \$55,674 in Alberta, \$49,834 in New Brunswick, and \$6,968 in Prince Edward Island. Of the total capital in all establishments in Canada in 1905, 55.19 per cent. was fixed in land, buildings, and plant, and 44.81 per cent. was circulating or working capital. In this respect, also, there are great differences between provinces, the percentage of fixed capital being as high as 78.93 per cent. in

Nova Scotia and 73.23 per cent. in British Columbia, and as low as 48.98 per cent. in Ontario.

The total number of employees in industrial establishments employing five persons and over in Canada in 1905 was 383,920, against 339,173 in 1900, an increase of 44,747. Salaries and wages totalled \$162,155,578 in 1905, against \$113,249,350 in 1900, an increase of \$48,906,228. Thus the number of employees increased by 13 per cent., while salaries and wages increased 43 per cent. The average salary per employee was \$850 in 1905, against \$771 in 1900, while the average wage per employee in 1905 was \$379, against \$290 in 1900. The average wage in 1905 was highest in Manitoba (\$519), Alberta (\$517) and Saskatchewan (\$422); approached the average in Ontario (\$369), Quebec (\$357), Nova Scotia (\$351), and New Brunswick (\$305); and was lowest in Prince Edward Island (\$125). The number of female wage earners in 1905 was 66,596, against 74,079 in 1900—a decrease of 7,483, or 11 per cent. Female wages amounted in 1905 to \$14,559,936, against \$12,057,407—an increase

of \$2,502,529, or 20 per cent. The average female wage increased from \$163 in 1900 to \$218 in 1905—34 per cent.

The value of products of the establishments of Canada employing five persons and over in 1905 was \$706,446,578, against \$481,053,375 in 1900—an increase of \$225,393,203, or 46.85 per cent. Alberta and Saskatchewan together show an increase of 277.80 per cent.; Manitoba, 115.49; British Columbia, 94.35; Ontario, 49.62; Quebec, 36.76; Nova Scotia, 35.58; New Brunswick, 4.10; while Prince Edward Island shows a decrease of 27.09 per cent. The following table shows the number of establishments, the average value of products, and the average product per establishment, of the largest manufacturing establishments in Canada in 1905, compared with the corresponding figures for 1900:—

TABLE III. LARGEST MANUFACTURING ESTABLISHMENTS, 1900-1905.

	Estab- lish- ments	Value of Products	Average product per estab- lish- ment
	No.	\$	\$
1. Establishments with products of \$200,000 to under \$200,000			
1905	479	145,587,183	303,940
1900	323	94,531,698	292,668
2. Establishments with products of \$500,000 to under \$1,000,000

On Dec. 31, 1907, there were in Canada 16 completed blast furnaces, of which 14 were in blast and 2 idle. In addition there were 3 furnaces partially completed. On June 30, 1908, the number of furnaces in blast was 7, and of those idle, 9. In the calendar year 1907 the Dominion government paid \$2,305,296 in bounties on iron and steel production, of which \$201,421 was on 95,915 tons of pig iron made from Canadian ore; \$591,584 on 537,803 tons of pig iron from imported ore; \$1,099,173 on 666,500 tons of steel ingots; and \$412,417 on 68,738 tons of steel wire rods.

In 1902 western Ontario had great hopes of rivalling Michigan in raising sugar beets and manufacturing them into sugar. Ontario has practically the same soil and climate as Michigan, and the success of the industry across the lake induced the Canadian farmers to raise sugar beets. Beet-sugar factories were erected at Wiarton, Dresden, Berlin and Wallaceburg at a cost of several million dollars. All these plants were operated for a time at a loss, with beets raised in the locality of each factory. The factory at Dresden, the first to be abandoned, was sold to a firm in Michigan, and was removed to that State. The Wiarton plant was dismantled and the machinery shipped to Los Angeles, Cal., to be there used as a distillery. The plant at Berlin was also idle for some time and was to be abandoned. The Wallaceburg

factory is in operation, but much of the output is the product of sugar refined from imported raw material. In other words, this plant is more of a sugar refinery than a beet-sugar factory. The principal cause of the failure of this industry in Ontario is the refusal of the farmers to raise any more sugar beets after two seasons' trial. They say that other crops bring them larger returns with less labor.

The province of Manitoba has not yet reached the manufacturing stage in the course of its economic development. Lumber, bricks, and similar articles required by settlers are largely produced. But in 1908 a stock company was establishing a match factory at Selkirk, which was expected to be in full operation in the spring of 1909. The capital of the company is \$40,000. In 1908 there were three other match factories in Canada, with a total capital of \$250,000. One of these, with \$190,000 capital, largely controls the trade. The three factories employed 278 working people. In 1871 there were 24 match factories with 1127 workers.

The province of Manitoba has not yet reached year 1908 was 49,928. The production during the fiscal year 1907-8 of spirits was 6,849,763 gallons; malt, 99,577,820 pounds; malt liquor, 38,800,380 gallons. In the latter part of 1908 an arrangement was made with the United States regulating the use of the water of the Niagara River for obtaining power. Canadians will be allowed the use of an amount of water sufficient to generate 425,000 horse power; Americans, 236,000 horse-power.

FOREIGN COMMERCE. For the fiscal year ended Mar. 31, 1908, the total imports entered for consumption amounted to \$358,373,685, and the total exports, \$280,006,606, against \$340,374,745 and \$272,206,606 respectively in the fiscal year 1907 (9 months). In 1908 the imports consisted of \$351,825,024 worth of merchandise, of which \$218,105,116 was dutiable and \$133,719,908 free, and \$6,548,661 of coin and bullion; the exports consisted of \$263,368,952 of merchandise, of which \$246,960,968 was home produce and \$16,407,984 foreign produce, and \$16,637,654 coin and bullion. The customs duties collected on imports in 1908 amounted to \$58,320,737. The principal imports entered for consumption in 1908 were: Breadstuffs, \$11,341,141; coal and coke, \$31,214,236; cotton, \$6,096,487; cotton manufactures, \$17,331,761; drugs, dyes, chemicals, and medicines, \$9,389,107; electric apparatus, \$3,133,761; flax, hemp, jute, and manufactures thereof, \$6,103,414; fruits, \$8,831,833; hides and skins, \$4,908,871; iron and steel and manufactures thereof, \$62,052,741; settlers' effects, \$10,681,625; silk and its manufactures, \$5,291,925; sugar, molasses, etc., \$11,948,629; wood and its manufactures, \$13,219,709; wool and its manufactures, \$22,894,548. The exports of home produce in 1908 were classed as follows: Products of the mine, \$39,560,612; of the fisheries, \$13,906,567; of the forest, \$44,504,371 (lumber, \$39,911,288); animal produce, \$55,913,782 (living animals, \$11,650,202; furs, \$2,608,574; meats, \$12,418,583); agricultural produce, \$75,548,935 (fruits, \$6,012,894; grains, \$53,080,577; flour and meal, \$8,325,655); manufactures, \$33,069,468 (agricultural machinery, \$3,371,283; drugs and chemicals, \$2,335,871; iron and steel, \$2,735,060; leather, \$2,200,674; paper, \$3,511,104). The trade with the principal countries of origin and destination in 1908 was as follows:—

From and to	Imports entered for consumption	Exports of Canadian Produce
United States	\$210,652,825	\$90,814,871
Great Britain	94,959,471	126,194,124
Newfoundland	1,777,469	3,212,635
Australia	440,543	2,856,709
New Zealand	256,579	990,551
British Africa	32,193	2,003,598
British East Indies	4,050,098	29,800
British West Indies	7,666,703	2,449,646
British Guiana	1,328,356	601,395
British Empire	111,240,895	139,172,890
Argentina	872,026	2,264,122
Austria-Hungary	1,331,389	11,315
Belgium	2,380,649	2,248,747
Cuba	471,017	1,353,442
France	9,901,909	1,762,832
Germany	8,163,047	1,959,891
Holland,	1,426,335	732,409
Italy	781,497	347,238
Spain	1,126,977	106,594
Switzerland	2,734,779	16,414
China	728,054	954,262
Japan	2,177,244	734,868
Mexico	919,932	475,147

Since 1900 British goods have been enjoying a preferential tariff amounting to a reduction of 33 1-3 per cent. The commercial convention with France finally adopted, in 1908, provides that a large number of Canadian products shall have the benefit of the French minimum tariff in France and its colonies, and that a large number of the products of France and its colonies shall have the benefit of the Canadian intermediate tariff and of the lowest duties applicable to like products of foreign origin.

The foreign trade passing through the ports of the various provinces in 1908 is shown in the following table:

	Imports	Exports
Ontario	\$160,048,542	\$68,550,565
Quebec	127,291,492	134,413,105
Nova Scotia	15,291,937	17,359,714
New Brunswick	10,776,591	26,363,098
British Columbia	24,180,452	23,941,187
Manitoba	22,566,386	4,103,067
Prince Edward Island	689,274	636,406
Alberta	4,606,959	297,320
Saskatchewan	3,744,339	883,271
Yukon	1,534,008	3,458,874

The foreign trade of the principal ports in 1908 was as follows:

	Imports	Exports
Bridgeburg, Ont.	\$2,303,838	\$9,315,647
Fort William, Ont.	3,429,225	7,570,096
Hamilton, Ont.	13,071,666	240
Niagara Falls, Ont.	1,835,990	17,616,132
Port Arthur, Ont.	3,113,337	5,165,882
Prescott, Ont.	1,904,565	9,597,371
Sault Ste. Marie, Ont. ..	4,350,927	6,332,086
Toronto, Ont.	63,519,859	23,753
Windsor, Ont.	6,275,019	6,378,371
Coaticook, Que.	247,298	12,460,239
Montreal, Que.	103,534,432	89,782,587
Quebec, Que.	13,322,824	1,768,403
Halifax, N. S.	9,050,370	9,769,143
St. John, N. B.	7,372,389	20,304,281
Vancouver, B. C.	13,637,841	6,734,726
Winnipeg, Man.	18,963,378	366,011

SHIPPING AND NAVIGATION. The number and tonnage of all vessels on the shipping registry of Canada on Dec. 31, 1906, were 7,516 and 663,415, respectively, including 2,811 steamers of 225,625 tons. The registered tonnage of vessels entered and cleared in the foreign trade in 1907-8 was 39,575,031; in the coasting trade, 50,529,835. Of the tonnage of sea-going vessels entered and cleared (19,491,271), 10,329,515 was British, 2,606,660 Canadian, and 6,555,096 foreign (3,549,271 American). Of the tonnage entered and cleared in the trade on rivers and lakes between Canada and the United States, 9,111,186 was Canadian and 10,972,574 American.

INTERNAL COMMUNICATIONS. The length of steam railways in operation in Canada on June 30, 1907, was 22,452 miles (1,076 miles double track), showing an increase of 1,099 miles during the year, of electric railways, 815 miles. Included in these figures are the Intercolonial and Prince Edward Island railways, 1,719 miles, owned by the Dominion government. The gross earnings and operating expenses of steam railways during the year ended June 30, 1907, were \$146,738,215 and \$103,748,677 respectively; of electric railways, \$12,635,905 and \$7,737,252. The cost of the construction of government railways down to June 30, 1907, was \$162,387,330; working expenses, \$130,194,269; revenue, \$118,819,364; total deficit, \$11,374,905. For the year ending June 30, 1907, the government railways showed a deficit of \$80,453. The number of persons killed and injured on steam railways in 1907 was 587 and 1,698 respectively; on electric railways, 71 and 1,736. In 1908 the Canadian Pacific Railway opened 906 miles of new line; the Grand Trunk Pacific, 870 miles of new line; and the Canadian Northern completed or partly built 930 miles, making a total of at least 2,000 miles of new line built in 1908. The greatest railway enterprise in progress in 1908 was the extension of the Grand Trunk Railway through the Northwest to the Pacific terminal of Prince Rupert. In 1908 trains were running regularly over the whole section 666 miles west of Winnipeg into Alberta. It was expected that Prince Rupert would be reached in 1911. A railway was also projected from the west to Fort Churchill, on Hudson Bay.

The canal, river, and lake system of Canada has over 2,700 miles of navigation. The proposed Georgian Bay Canal, the survey of which was completed, would run from Georgian Bay, on Lake Huron, through the French, Nipissing, and Ottawa rivers to Montreal, thus shortening the distance to Liverpool via New York by 806 miles. The length of telegraph lines in 1907 was 32,455 miles.

BANKS. In 1907 (monthly averages) the paid-up capital of the chartered banks of Canada was \$95,953,732; reserve funds, \$69,806,892; notes in circulation, \$75,784,482; deposits \$654,839,711; outstanding loans, \$709,975,274; liabilities (excluding capital and reserves), \$769,026,924; assets, \$945,685,708. The above deposits included \$16,654,729 of the Dominion and provincial governments, and \$58,828,181 deposited elsewhere than in Canada. The transactions of the clearing houses of chartered banks in 1907 were \$4,197,465,393. The average monthly circulation of Dominion notes in 1907 was \$59,017,440. The number of post office savings banks in 1907 was 1,043. The transactions of the post office and Dominion

government savings banks during the fiscal year ending Mar. 31, 1907, were as follows: Cash deposits in year (9 months), \$12,000,958; withdrawals, \$12,731,468; at credit of depositors Mar. 31, \$62,541,802. On May 31, 1908, the chartered banks had a paid-up capital of \$96,008,221; notes in circulation, \$67,770,018; deposits by the public, \$552,079,199; deposits elsewhere than in Canada, \$61,262,006.

BUSINESS CONDITIONS IN 1908. The world-wide business depression which began in the latter part of 1907 manifested itself in Canada in various ways. People ceased to undertake new business ventures, contenting themselves with serving immediate needs at a moderate profit. The number of idle blast furnaces, as noted above, increased from two at the end of 1907 to nine in the middle of 1908. Insolvencies during the first nine months of 1908 numbered 1,221, with liabilities of \$11,826,386, against 870 failures, with \$4,022,062 of liabilities, for the same period in 1907. The circulation of notes of the chartered banks decreased from an average of nearly \$76,000,000 for 1907 to less than \$67,000,000 on May 31, 1908, while deposits in them by the public decreased from an average of \$579,356,801, for 1907 to \$552,079,179 on May 31. The imports for home consumption during the first seven months of the fiscal year 1908-9 (April-October) declined nearly \$60,000,000 from the same period in 1907, and the exports showed a decrease of nearly \$13,000,000.

FINANCE. In the fiscal year 1907-8 the revenue of the Consolidated Fund was \$96,054,506; other revenue, \$911; total revenue, \$96,055,417. The principal sources of revenue were: Customs, \$7,543,811; excise, \$15,782,152; post office (net), \$7,107,887; Dominion lands, \$1,883,620; interest on investments, \$1,925,569; public works, including railways and canals, \$9,973,523. The expenditure on account of the Consolidated Fund in 1907-8 was \$76,641,452, the principal items being: Interest on public debt, \$10,973,597; sinking funds, \$2,234,263; militia and defense, \$5,498,184; public works, \$8,721,327; subsidies to provinces, \$9,032,775; mail subsidies and steamship subventions, \$1,590,384; lighthouse and coast service, \$2,835,543; Indians, \$1,276,964. The expenditure in 1907-8 chargeable to capital was \$30,428,996, of which \$1,723,156 was on canals, \$4,369,738 on the Inter-colonial and connected railways, \$2,969,049 on public works \$18,910,254 on the National Transcontinental Railway, \$4,583,092 on the Prince Edward Island Railway, and \$1,297,905 on militia. The public debt on Mar. 31, 1908, was \$408,207,158, showing an increase during the year of \$14,289,000. The assets of the Dominion on Mar. 31, 1908, amounted to \$130,246,298, leaving a net debt of \$277,960,860.

ARMY. The King is commander-in-chief of the naval and military forces, but the control of them rests with the Dominion Parliament. In 1904 a Militia Council was organized and the office of Inspector-General created. The entire country is divided into 13 military districts. All citizens from 18 to 60 years of age are included in the militia, which is divided into 4 classes. The first two classes include the unmarried men from 18 to 30 and from 30 to 45 years respectively; the third class includes married men from 18 to 45 years; and the fourth class, all men from 45 to 60 years. Recruitment in the militia is by voluntary enroll-

ment and by drawing lots. The duration of service is three years. The annual number of reservists called for training for a period of from 8 to 16 days is 45,000. In 1908 the effective force consisted of the permanent militia, 2,884 men; the active militia in training, 44,121 men, and 7,732 horses. The naval defense of Canada is at present entrusted to the Imperial authorities.

GOVERNMENT. The Governor-General in 1908 was Earl Grey. The Privy Council and Cabinet consisted of the following: Premier and President, Sir Wilfrid Laurier; Secretary of State, Charles Murphy; Minister of Trade and Commerce, Sir R. J. Cartwright; Minister of Justice and Attorney-General, A. B. Aylesworth; Minister of Marine and Fisheries, Louis P. Brodeur; Minister of Railways and Canals, G. P. Graham; Minister of Militia and Defense, Sir F. W. Borden; Minister of Finance, W. S. Fielding; Postmaster-General, Rudolphe Lemieux; Minister of Agriculture, Sydney A. Fisher; Minister of Public Works, William Pugsley; Minister of Interior, Frank Oliver; Minister of Customs, William Paterson; Minister of Inland Revenue, W. P. Templeman; Minister of Labor, W. L. M. King.

Each of the nine provinces has a separate legislature, administration, and responsible ministry. A Lieutenant-Governor appointed by the Governor-General is at the head of the executive. In Quebec and Nova Scotia the legislature is bicameral, in the others, unicameral. Yukon Territory is governed by a Commissioner and an Executive Council of ten members, five of whom are elected by the people. The Northwest Territories are governed by a Commissioner and a Council of four, appointed by the Governor-General in Council.

HISTORY.

ASIATIC IMMIGRATION QUESTION. On Sept. 7, 1907, rioting took place at Vancouver, British Columbia, owing to the opposition of labor unions and their sympathizers to the further immigration of Japanese and Chinese laborers. Some fifty Japanese and Chinese stores were wrecked and a few of the Asiatics were injured. The Canadian government immediately communicated with the Japanese government and with the British government. The causes of the riot were investigated and an expression of regret was sent to Japan and cordially accepted. This affair brought up the question whether in view of Great Britain's treaty with Japan the Canadian attitude toward Japanese immigration could be maintained. The British government showed itself considerate of Canadian interests in this matter and consented to the sending of an emissary to Japan to negotiate an arrangement which should be satisfactory to Canada. The Hon. Rudolphe Lemieux, Postmaster-General and Minister of Labor, was chosen by the Canadian government as the envoy. It is to be noted that Mr. Lemieux went as the imperial envoy of the Canadian government, and not as the Canadian envoy of the Imperial government. Thus the mission was regarded as marking an important step in the attainment of the aim sought by the present Canadian government, that is, power to control matters exclusively or principally relating to Canada.

Mr. Lemieux was cordially received by the Japanese government and his negotiations were successful. After his return he issued, on Jan.

21, 1908, a statement concerning his mission. He declared that the Japanese government was in no wise to blame for the immigration, but only the Japanese emigration companies. From 1903 down to 1905, Canada had received repeated assurances from Japan that the Japanese government would voluntarily restrict immigration. Having received these pledges, Canada had unreservedly acceded to the Anglo-Japanese Treaty of 1905. Count Hayashi, who had shown himself friendly to Canada throughout, wrote to Mr. Lemieux, Dec. 23, 1907, that the Japanese government would take effective means to restrict immigration, and would pay especial regard to the conditions in Canada and meet the desires of the Canadian government, so far as was compatible with the dignity of the state and the spirit of the treaty. Mr. Lemieux said that contract laborers would be excluded, and pointed out that the restriction of Hawaiian immigration was within the power of the Canadian government, for Japan had no control over it. On Jan. 20 he submitted the report of Mr. Mackenzie King, the deputy minister of labor, on his investigation of the question in British Columbia (q. v.). Mr. King also referred to the fact that the Japanese government did not control Hawaiian immigration, which therefore might be restricted by Canada, and he added that if this were checked and the immigration from places outside Japan were restricted, there would be little danger of undesirable immigration.

Thus although the present Anglo-Japanese Treaty recognizes the right of Japanese subjects to enter, travel, and reside in the Dominion, it was expected as a result of the understanding between the two governments reached in these negotiations that no further trouble would arise on this score. In British Columbia (q. v.), however, there was strong opposition to the policy of the Dominion government, and some complications arose there in connection with the question. In January, Orders in Council became effective prohibiting the landing in the Dominion of any immigrants whose passage had been paid by a charitable institution or out of the public moneys, and empowering the government to exclude immigrants who did not come on a through ticket from the country of their origin or adoption. This led to the arrest of two Japanese and a number of East Indians, who had come to Canada from Hong Kong. On Mar. 25, however, the British Columbia Supreme Court held that the Order in Council was invalid, and ordered the release of the prisoners. On Mar. 27, the East Indian immigrants in Vancouver held a mass meeting and protested against the discrimination shown against them. A telegram was sent from the meeting to the British India Office at London. The ground on which the Supreme Court had annulled the order for the deportation of the Indians was a technical one and was removed by a new order of the Cabinet. A little later, on Apr. 10, a bill was passed by the Dominion Parliament which provided for the exclusion of immigrants unless they came from the country of their origin or of their adoption.

On May 6, Mr. Mackenzie King, who had been sent to England to confer with the imperial authorities on the subject of East Indian immigration, presented a report to the Canadian Parliament in which he declared that he believed a satisfactory adjustment could be reached without

recourse to legislation, either in Canada or the home country. The home authorities, he said, recognized Canada's natural wish to remain a "white man's country," and to restrain Asiatic immigration; and they did not deny her right to manage her own affairs in this matter, but on the contrary desired Canada to pass such laws in regard to immigration as suited her interests. They felt assured that Canada's sense of her relations to the Empire would prevent her disregarding the obligations which rested upon her. The recommendations in his report were directed to the checking of those influences which tended to promote immigration without regard to the welfare of the immigrant. Such promotion had been the policy of the steamship companies, which had greatly fostered immigration. Their power to do this now, however, was nearly destroyed by the rule which prohibited immigration except on through tickets purchased in the country of origin or adoption, and on continuous journey therefrom to the country of destination. Moreover, in India immigration under contract to labor was prohibited by law, and such immigration could be stopped in Canada by refusing to allow the landing of such immigrants as had come in violation of the laws of their own country. In June, the Canadian House of Commons passed a law providing that only such Chinese students could be admitted as had been students in their own country and came to Canada for the purpose of continuing their education, and imposing a poll tax of \$300 upon them, which, however, was to be refunded after they had completed a year of study in Canada. In the same month an Order in Council was issued for the denial of admission to any Asiatic immigrant who had not at least \$200. An award of \$50,000 was granted early in June to the Asiatics who had suffered in the Vancouver riots of September, 1907.

PARLIAMENT. Parliament assembled on Nov. 28, 1907. Owing to the fact that this was to be the last session before the Dominion election, and that the government intended to introduce a bill amending the federal election laws, as well as other measures of pressing importance, there was a good deal of partisan feeling in the debates, the opposition fighting the elections bill with such persistent determination that the government had to postpone the bill in order to have the supplies voted in the budget in March. The budget contained appropriations for the Transcontinental Railway and for giving effect to the law passed respecting the national battlefields at Quebec. The session, which ended in July, proved to be the longest since Confederation in 1867, and in the quantity and character of the legislation, one of the most important since that event.

Besides the two bills mentioned in connection with the budget, and the Immigration Acts previously described, there were enacted into law an old-age government annuities bill, a civil service reform bill, bills for the prohibition of the sale of tobacco and cigarettes to boys under sixteen years of age, and for the prohibition of the importation, manufacture, and sale of opium for other than medicinal purposes, and a bill providing additional safeguards against noxious ingredients in patent medicines. Sir Wilfrid Laurier introduced a resolution, which the House of Commons passed, extending certain provincial boundaries. By this measure Manitoba acquired

Fort Churchill and York Factory, on Hudson's Bay, Ontario gained some accessions to the north, as far as James Bay, and Quebec acquired the Canadian portion of Labrador. There were also laws passed providing for the purchase of seed grain for western settlers, and for the granting of lands to Canadian soldiers who took part in the South African War. Two laws of special importance to Western Canada were the Manitoba grain act and an act for better grain inspection. They were designed to maintain the highest quality and price of western wheat for export and to facilitate its marketing and transportation, the western farmers having suffered serious financial loss through lack of such supervision and assistance, which these laws provide. Another law passed especially for the benefit of Western Canada was the lands bill, giving pre-emption rights to homesteaders for an additional 160 acres at \$3 an acre (practically increasing the size of the average farm in the Prairie Provinces to 320 acres) and authorizing the construction of the Hudson's Bay Railway, and the release of over 40,000,000 acres of land for settlement.

Very interesting as confirming the success of the work of the Canadian Railway Commission, and pointing out new uses for it, were laws enlarging the scope of the Commission by adding three members to it, and placing telegraph and telephone lines under its jurisdiction. Another law having relation to financial stringency was that amending the Bank Act so as to permit, under certain safeguards, an expansion of the note circulation of the banks during the crop-moving time of the year. The House of Commons pledged financial support to the "All Red" Route (see below) and a resolution was passed in the House, authorizing the government to negotiate with the governments of Australia and New Zealand, with a view to bringing about a speedy consummation of the project. The two most important laws were, however, those amending the existing election laws, and providing for civil service reform. By the first of these, federal officials were appointed to revise Manitoba and British Columbia voting lists, the rights of voters are more effectually protected, and heavier penalties are prescribed for those who exercise undue influence; by the second, appointments and promotions to the civil service will be made after a competitive examination, and the law will be administered by commissioners practically independent of the government. The mining interests of British Columbia were encouraged by a law extending for five years the payment of a bounty on lead ores. The old-age government annuities bill was so framed as not to have too much of the character of a pensions scheme, but was intended, as far as possible, to encourage habits of thrift and economy, insuring to the holders some provision for advanced years. See OLD AGE PENSIONS.

There were also measures which, although successful in the House of Commons, failed to pass the Senate. The chief of these was the coöperative societies bill, which was strongly opposed in the Senate by members who sympathized with certain business interests. It was noteworthy also that the protracted resistance of the Conservative Opposition to the Dominion elections bill, as well as charges of corruption against the government in connection with its disposal of timber limits, caused unusual com-

ment in the press of the country and among the public generally, about the undue length of parliamentary sessions and the waste of time in unnecessary discussion. With regard to the first measure, the length of discussion caused consideration by the government of the necessity of introducing the closure to regulate parliamentary debate, and promote the expediting of parliamentary business.

NEW TREATIES. Secretary Root's visit to Ottawa in January, 1907, inspired confidence in a satisfactory adjustment of the various questions pending between the United States and Canada, and this was strengthened by Ambassador Bryce's visit in February, 1908. Among other points may be mentioned the requirement that no duty should be imposed on goods in transit across parts of the United States and Canada; that the Alien Labor Laws should apply to citizens of the United States and Canada; that reciprocal mine owning rights should be granted; that provision should be made for the conveyance of American prisoners through Canada and Canadian prisoners through the United States; that reciprocal arrangements should be made in regard to wreck-age and salvage; and that no poll tax should be imposed on Canadians temporarily residing in the United States. Besides these there was a question of certain pecuniary claims. On Apr. 11, a treaty was made in regard to the fresh water fisheries, whereby it was provided that uniform regulations shall be made by an international fisheries commission of two persons, one appointed by Canada and one by the United States, to settle questions arising from the fisheries in the frontier waters, and which should last for four years; and on the same day a second treaty was made, for the settlement of all difficulties arising from international boundary questions. Meanwhile, an arbitration treaty with the United States had been under discussion, and an understanding was reached whereby the United States acknowledged Great Britain's right to consult with her self-governing colonies as to the subjects of arbitration, and Great Britain admitted the principle that the United States Congress shared in the treaty-making power with the Executive. This treaty was ratified by the United States Senate toward the end of April. See UNITED STATES, *Treaties*.

At the close of the year the settlement of the pecuniary claims between the United States and Canada was still pending.

The new commercial convention with France which had been under discussion during 1907, but had not been ratified by either government, was ratified by Canada on Apr. 3, 1908. The year passed, however, without its acceptance by the French government. According to its main provisions, Canada extended to a large number of French articles of manufacture the benefits of its intermediate tariff rates, which are ten per cent. less than the general tariff; and the French government, in return, was to give Canada the benefit of her minimum tariff rates on an extensive list of Canadian articles, including food stuffs, agricultural implements, etc.

THE QUEBEC TER-CENTENARY. The project for the celebration of the three hundredth anniversary of the founding of Quebec was discussed in the summer of 1905, and the government authorities were asked to take action in the matter. In May, 1907, a general committee

THE "DON DE DIEU" APPROACHING QUEBEC WITH CHAMPLAIN AND HIS CREW REPRODUCED
FOR THE HISTORIC PROCESSION

on organization was appointed. In Dec., 1907, the Governor-General, Earl Grey, proposed, as a permanent memorial, that the battlefields should be restored, and it was decided to nationalize them and build a parkway around the cliff and a great monument which should dominate the harbor. On March 3, Sir Wilfrid Laurier announced that the celebration of the ter-centenary and the nationalization of the battlefields would take place in July. It was decided that the buildings that had been built on the Plains of Abraham should be removed, and that the battlefields of Sainte Foye and the Plains of Abraham should be included in a national park. The King approved the measure and contributed to its cost. The celebration began on July 19. Representatives of Great Britain, France, the United States, and other foreign countries were invited, and battleships from the fleets of these nations, as well as from Germany, Italy, Spain, Japan, and Argentina, gathered in the harbor. The Prince of Wales, accompanied by the Earl of Dudley, the new Governor-General of Australia, arrived on July 22, having been preceded by Lord Roberts, as representative of the British Army, by the Duke of Norfolk, and others. The living descendants of the Wolfe and Montcalm families, whose ancestors had been so closely associated with Canadian history, were represented. The celebration began with a parade on July 19. July 23 was Champlain Day, in honor of the founder of the city; and a feature of the ceremonies on that day was the sailing to the landing place of a fac-simile of the vessel in which Champlain had arrived. On July 24, the battlefields were dedicated in the presence of nearly thirty thousand soldiers from all parts of Canada, and the war ships in the harbor took part in the ceremonies. For two weeks the city was full of soldiers and illuminations and pageants were held to celebrate the striking events in Canadian history and the deeds of great Canadians like Champlain, Cartier, Laval, Frontenac, and Montcalm. One of the pageants, which was given expressly for the Prince of Wales, displayed the armies of Wolfe and Montcalm marching across the Plains of Abraham. In his reply to an address from the city, the Prince congratulated his hearers on the presence of the American and French representatives as an evidence of good will between their countries and Canada and Great Britain. The effect of the celebrations was said to have been a great step toward the cementing of the Dominion and the Empire and the promotion of friendly feeling between them and the United States.

THE "ALL-RED" ROUTE. At the Imperial Conference in London in 1907, Sir Wilfrid Laurier had carried through a resolution in regard to an "all-red" line of British steamships which should connect Great Britain and the self-governing colonies with the Far East, giving a fast steamship service between Liverpool and Melbourne, and a fast train service across Canada to Vancouver, B. C. The negotiations begun in that year were continued in 1908, and were upheld by Lord Strathcona and other capitalists. It was announced in March that the project called for the following subsidies: Great Britain, £500,000; Canada, £325,000; New Zealand, £100,000; and Australia, £75,000. In a speech at the meeting of the Royal Colonial Institute on April 7, Lord

Strathcona described the nature and purpose of the route, which he said was to constitute a British highway between Great Britain, New Zealand, and Australia, by way of Canada, the objective points being wholly in British territory and under British control. Among the arguments that were urged on its behalf were the following: Improvement of the communications between the United Kingdom and Canada by giving a more rapid service; the inducement that it would offer to American travel by its quicker service to the United States and its geographical advantages, and to that part of Canadian travel which now passes through New York; faster service to New Zealand and Australia; the provision of an alternative route to the East which could be used by the military; advantages to the Empire's position in both oceans in war and in trade. It was required that the latest and best types of steamships should be employed. It was pointed out that if such vessels as the *Lusitania* and the *Mauretania* were used, there would be a saving of nearly two days in time. Sir Wilfrid's original plan called for a four-day service to Halifax, an equal time for crossing Canada, and a sixteen days' service to Sydney; but this was criticised by Sir Joseph Ward, of New Zealand, as not fast enough on the Pacific. He declared that New Zealand would not grant a subsidy unless the passage from Vancouver to New Zealand was reduced to twelve days, and unless New Zealand had the first port of call in Australasia. It was generally understood that the northern route would be taken, the Canadian Pacific having shown that such a route was commercially possible, and having already an "all-red" route, though slower than was required. On July 9, 1908, Sir Wilfrid Laurier proposed a resolution declaring that Canada would assume her share of the subsidy, and urging that the other colonies take action without delay. It was passed by a vote of 100 to 47. New Zealand was the only other colony that had thus far made a definite proposal.

THE ELECTORAL CAMPAIGN. The campaign began in August. The Liberal programme was simply the laying of emphasis on the work accomplished by the party and the necessity of continuing the Liberals in power in order to carry out what they had begun. They asserted that no period could compare in point of prosperity with the twelve years of the Laurier government that had just elapsed; and they pointed to the great public works undertaken, and to the fact that the country was on a better footing than ever before as regards immigration, being indeed the special destination of immigrants, drawing settlers of the best classes. The programme of the Conservatives consisted mainly in the charges of graft and corruption, including bad appointments, corrupt administration, and misuse of the public moneys and electoral power. Thus, as in the United States, the campaign hinged rather on matters of personal fitness for administration than on principles of policy. One of the main reasons for which it was urged that the government be retained was that it might complete the Transcontinental Railway. As to the tariff policy, Sir Wilfrid Laurier declared that the Liberals desired reform, not revolution, and that any changes in the tariff must be gradual and cautious. The date of the general election was fixed on Oct. 26.

WOOLEN DUTIES. Representatives of the woolen industries demanded an increase of the tariff, protesting against the preference of 33 1/3 per cent. to Great Britain, which they declared at this period of depression was excessive. Duties, they said, must be increased if the industry was to continue and the 4,500 workmen engaged in it were to retain their employment. At a meeting of the Canadian Manufacturers' Association in September, the attitude of the government was severely criticised, and it was declared that the woolen industry was gradually disappearing. During the previous session of Parliament the woolen manufacturers had demanded an increase, and the matter came up before the Commission of 1906, which had made some concessions; but they now insisted on further concessions. In reply to these demands, the Premier said that it must be remembered that he represented not only the manufacturers but the consumers. He did not attach much importance to the charge that British goods were shoddy and ill-made, asking why, if Canadian consumers desired that class of goods, the Canadian producer did not manufacture them. He favored the appointment of a commission to investigate the condition of the industry in England, Germany, and other countries, and said that in fact a commissioner had already been sent to England for that purpose. He contended that the tariff, which was only two years old, should have a fair trial. The proposal of a permanent tariff commission seemed to him questionable, but he said it would receive careful attention.

THE ELECTIONS. During the latter part of the campaign, the discussion had been mainly on the question of the honesty of the government. The charges of graft and corruption were vigorously made and as vigorously denied. Sir Wilfrid Laurier declared that the prosperity of the country had been largely due to the immigration policy, and especially to the high class of settlers that came from the United States. As to the Grand Trunk Railway, he said that although, as he had repeatedly declared, the contract was an unwise one, the Conservative party if it came into power would be obliged to carry out the plan, even though it had not originated with them. Parliament was dissolved early in October. As a result of the election of Oct. 26, the position of parties was as follows: Liberals, 134; Conservatives, 86; exclusive of the returns from the Yukon district, which were not yet known, but were afterward found to add to the government's strength. All the Liberal members of the government were returned with the exception of Mr. Templeman of Victoria. This was interpreted as a popular endorsement of the government policy, the majority being only slightly reduced. Some charges of unfairness and corruption were made toward the close of the year. A letter of Sir Wilfrid Laurier to a fellow candidate, approving the latter's promise to the members of the Civil Service that the government if returned would increase their salaries, caused much adverse comment as a violation of the Dominion Elections Act, which declared it an indictable offence to make any gift, loan, or promise for the purpose of influencing a vote. Protests were also made against the system of pairing off petitions, as practiced especially in Ontario and Nova Scotia. "Pairing off" is a practice according to which repre-

sentatives of opposing party organizations agree, before the time for filing petitions against the return of members of Parliament alleged to be corruptly elected has expired, to refrain from filing such petitions, one side agreeing not to use evidence against the other in consideration of a like favor from the other side. On Dec. 4, delegations from both parties met at Toronto and paired off petitions until only four were left. The practice was sharply discussed in the newspapers. Voters were accused of repeating in an Ontario constituency. Charges of bribery and corruption in the Civil Service took definite form in October and November, and were brought directly against the Marine Department. The government began an investigation, and as a result of this several officials were suspended. The commissioner who conducted the investigation at Quebec in November received testimony incriminating others. On Nov. 6 a witness testified that he had paid bonuses to twenty-four employees of the Marine Department, including captains, engineers of government vessels, inspectors, etc. Later, twenty-eight of the government employees were suspended by the Minister of Marine. The investigation of the Civil Service scandals continued in December. A report was shortly afterward made exonerating cabinet ministers, but finding certain subordinate officials guilty of misconduct. Some of the employees who had been suspended were permanently removed from the Civil Service.

CHURCH UNION. The movement for organic union of the Presbyterian, Methodist, and Congregational churches in Canada made noteworthy progress during the year. On Dec. 11 the joint committee representing those churches closed their fifth annual conference, and formally reported that, after due consideration of differences of polity and doctrine, there exists no obstacle in the way of organic union of these three religious denominations. It was said by some of those engaged in the deliberations that the work might be accomplished during 1911, and that the church resulting therefrom would be named "The United Church of Canada." So remarkable was the resolution passed by the joint committee considered to be, that one of its members gave out a statement that it had done more in the direction of organic church union than anything that had been accomplished since the Reformation.

INTERNATIONAL WATERWAYS. In June the Canadian members of the International Waterways Commission presented their report of work during 1907. In reference to the proposal to erect a dam or dams in the Niagara River, with a view to maintaining the level of Lake Erie, the Commission agreed that no works should be authorized which would lower the levels in Lake Ontario or the St. Lawrence River. With regard to power development at Niagara Falls, the Canadian Commissioners were of opinion that such power development would affect the level of Lake Erie and were therefore objectionable, and that the proposed diversion of 10,000 cubic feet per second from Lake Erie to Jordan River would reduce the lake level by six inches. The joint commission agreed that the scenic beauty of Niagara Falls should be preserved, that the diversion of more than 36,000 cubic feet of water per second on the Canadian side, and of more than 18,500

ENG. NEWS.

From the "Engineering News," New York

cubic feet on the United States side, would injure Niagara Falls as a whole.

In July the Minister of Public Works at Ottawa presented the report of the government survey of the Georgian Bay Canal. This affirmed that the canal, worked out on a basis of a 22-foot waterway for 400 miles between Georgian Bay and Montreal, could be built in ten years at a cost of \$100,000,000, and would be a saving of 282 miles as compared with the St. Lawrence route, and of 424 miles as compared with the Buffalo and New York route.

Among the notable events of the year were forest fires which destroyed the town of Fernie and several villages in British Columbia, inflicting a heavy loss of life and property. (See BRITISH COLUMBIA.) Sir Charles Fitzpatrick, Chief Justice of the Canadian Supreme Court, was appointed by the Imperial Government as one of the four representatives of Great Britain on the Permanent Board of Arbitration at The Hague to settle international disputes. Rural mail delivery was put into effect in September in certain districts of Canada. A great strike on the Canadian Pacific Railway in August, whereby over 6,000 mechanics in the various shops of the company left work, was settled without much loss. See STRIKES AND LOCKOUTS. The appointment of a British naval officer to command the Canadian marine service was looked upon as presaging an advance toward the development of a naval militia, as there are now seamen in training along British naval lines on the cruiser *Canada* and on some other vessels of the fleet of protective cruisers.

CANALS. The break in the bank of the Illinois and Michigan Canal on Sept. 2, 1908, 12 miles below Joliet, Ill., caused the draining of the 20-mile section between the Jackson street dam at Joliet and the Channahon dam, compelling the shutting down of the mills because of lack of power, and inundated the adjacent land. The canal extends from Bridgeport, on the Chicago River, to La Salle, on the Illinois, a distance of 100 miles.

The Evanston branch of the Chicago Drainage Canal, which begins at the lake shore in Wilmette, half a mile north of the Evanston boundary, and extends through the northwestern part of that section in a southerly direction, to a junction with the north branch of the Chicago River at Lawrence, was put under construction in April. It will be 100 ft. wide at the surface, 13 1-2 ft. deep, and 8 1-4 miles long, with a strip 250 ft. in width on each side, to be used as a parkway, and will require in its construction the excavation of 3,000,000 cubic yards of material. A spillway is also to be built in connection with the canal, at some point between the Desplains River and Willow Springs, having been made necessary by the spring floods, causing a flow from the river through the old Ogden ditch to the Chicago River, which in many cases reverses the direction of the current, and forces the Chicago River to discharge its sewage into Lake Michigan, from which the drinking supply is taken. Such a reversal of flow was produced by a heavy rainfall and melting snow on Mar. 6, making it necessary to open the bear-trap dam at Lockport, thereby increasing the discharge through the drainage canal from 250,000 to 600,000 cubic feet per second and reestablishing normal conditions.

NEW YORK BARGE CANAL. During the fiscal year ending Sept. 30, 1908, \$4,234,209.20 was

expended on the \$101,000,000 improvement of the Erie, Champlain and Oswego Canals, which brings the total to date up to \$8,311,432.14, and for which thirteen million in bonds have been issued. Of the above total, \$5,525,494.17 has been spent on the Erie Canal, \$2,396,065.46 on the Champlain, and \$389,872.51 on the Oswego. The following tabulated statement shows the condition of the work on the different contracts on Jan. 1, 1909.

Contract Number.	Total Value of Work		Percentage of work done to Jan. 1, 1909
	Put under Contract	Done to Jan. 1, 1909	
1.	\$603,898*	449,310	74.0

* Includes all alterations in force to date.

† Re-let,—not included in total.

The Cornwall Canal, at Cornwall, Ontario, broke through its banks on June 23, carrying with it the piers of the single-track, circular drum-bearing, 240 ft. draw span of the New York & Ottawa Railway. The canal, which starts at Cornwall, 60 miles west of Montreal and enters the river St. Lawrence again at Dickinson, 12 miles west, is 16 ft. deep and 95 ft. wide. The break resulted from a small leak in the bank, which developed until a 160 ft. breach had been made.

CANCER. The search for the specific cause and cure for cancer continued unabated during 1908. Investigations, both laboratory and statistical, were conducted in the United States, England, France, and Germany. In England the third scientific report of the labors of the Imperial Cancer Research Fund was issued, and contained evidence of a vast amount of experiment and observation. The question of the causal connection between irritation and can-

cer received much attention. A wide study of the cases in all parts of the world showed the congenital or embryonic theory of the origin of carcinoma to be without foundation. Thus cancer of the skin of the abdomen is practically unknown in Europe, but common in Kashmir. This is not due to the presence of embryonic germs in the abdominal cuticle of the Kashmiris, but to the irritation from wearing a charcoal oven about the waist. Again, cancer of the floor of the mouth is rare in European women, although not uncommon in men; but in East Indians it is frequent, owing to the fact that in India women chew betel-nuts and sleep with the cud in the mouth at the exact spot where the cancer starts. In needlewomen melanotic sarcoma often begins in the fingers, at the site of chronic needle traumatism. Laboratory investigation of mouse cancer, moreover, developed no evidence that these tumors are increased by inbreeding, and the theory of hereditary liability, though not disproved, is much weakened.

The French Cancer Research Association met in June and July. The sessions were thrown open to the public and were well attended. Experiences at the Pasteur Institute were cited to disprove the assumption of local heredity from consanguinity as an explanation of cancer, at least in mice. Everything pointed to a local cause of contagion. When spontaneous tumors appeared they almost always occurred in the dirtier cages, infected with vermin, especially bedbugs, the latter also infested with parasites, *acari*, which they carry from mouse to mouse. The microbes revealed in these tumors the debris of large parasites, nematoid worms and *acari*. The theory that certain houses or localities are cancer infected was investigated by Fillaissier, who, in examining the Paris sanitary reports, found twelve houses, in each of which 2 deaths occurred, 26 deaths in 5 workhouses, and 4 deaths in one religious institution. In 1890, Arnaudet selected 54 houses in one street 150 metres long; in 17 of these houses there were 21 cases of cancer, all of them in the same part of the street. There lived in Oyonnaux a woman with cancer of the breast. The dressings were thrown into a stream near by. Two lodgers in the same house developed cancer and two neighbors, who drank water from the stream became infected. These and similar data are the subject of scattered reports, but are too meagre to base definite conclusions upon.

Gaylord, of the New York State Cancer Laboratory, Buffalo, N. Y., conducted a great number of experiments on mice, to determine the resistance of tumor cells to low temperatures. The tumors which developed from material frozen with liquid air presented the histological characteristics of the transplanted tumor from which the material was taken. Gaylord holds that these experiments demonstrate the great resisting power of cancer cells to low temperatures, and does not agree with Moore and Walker, who performed similar experiments, that these phenomena prove the presence of a virus, although he believes in the existence of such a virus.

Kelling has studied the possibility of diagnosing cancer from the patients' serum, both with the precipitin test (See BLOOD) and the hemolytic test, and believes he can determine the presence of cancer by this method alone. He asserts that these biochemical reactions

unfailingly reveal malignant tumor formation, whether primary or recurrent. He has applied the tests to 600 cases, the precipitin in 200, and the hemolytic in 400. More than a third of the patients had cancer and in 28 cases the diagnosis was made solely by these tests. Kelling believes in the origin of cancer from embryonal cells from some other species and makes the serum for his tests on this assumption, using beef, sheep, pig, or poultry livers and extracts of chicken and pig embryos to prepare the six serums for the precipitin test. The chopped substance is kept in glycerine macerated, filtered and diluted to one part in one thousand of normal salt solution. One of these six serums becomes cloudy on addition to half the amount of the patient's serum in case of cancer, but never otherwise. Wyss, investigating the cause of X-ray cancer, concludes that repeated exposures to this influence causes the blood vessels to become gradually smaller, and finally obliterated. The epithelial cells are then obliged to obtain their nourishment directly from the adjacent cells or tissues, and thus assume the character of parasites. This explanation would apply also to other kinds of cancer, in which interference with blood supply may be the primal cause.

The net result of the year's investigation seems to add proof that the disease is not hereditary; that it occurs in tissues subject to chronic irritation, mechanical, chemical, or due to filth; that it is communicable by direct contact; and that spontaneous arrest or cure may take place through the development of some immunizing principle or antibody in the blood. No new therapeutic measures were advanced during the year.

CANET, GUSTAVE. A French artilleryist, died on Oct. 7, 1908. He was born in Belfast, in Sept. 1846, and was educated at the college there, at the Strasbourg Lycée, and at the Central School of Arts and Manufactures. He made many improvements in artillery, gunpowder and war appliances, his name being associated in particular with the artillery developed and manufactured at the famous Schneider Works at Le Creusot.

CANNING, SIR SAMUEL. An English electrical engineer, died on Sept. 24, 1908. He was born in 1823, was educated at Salisbury, and was engaged chiefly as a railroad engineer from 1844 until about 1852, when he became interested in the development of submarine telegraph cables, and especially in devices for laying, buoying, and recovering them. He assisted in laying the cable from Cape Breton Isle to Newfoundland in 1856, and a year afterward was one of the chief assistants to Charles Bright in laying the first Atlantic cable. He superintended the manufacture and laying of the Atlantic cable of 1865, which parted and was lost, and that of 1866, which was successfully laid. In the latter year he also commanded the expedition and devised the appliances with which the cable of 1865 was recovered and spliced, after which the laying was continued and completed. For these achievements he was knighted in 1866, and received other honors.

CANNING OF FRUIT. See HORTICULTURE.

CAPE COLONY. A British possession in South Africa. Area, including dependencies, 276,995 square miles. Population (1904), 2-

409,804, including 579,741 whites and 1,830,063 colored; estimated in 1907, 2,507,500. In 1907 there were 10,554 marriages, 60,415 births, 35,491 deaths, 29,767 immigrants, and 39,550 emigrants (1906: immigrants, 34,041; emigrants, 40,180). In Feb., 1907, a law was adopted requiring every immigrant to be in possession of visible means of support. The immigration authorities consequently insisted that the immigrant bring with him £20 in money or have a contract for a position. The population of the principal cities in 1904 was: Cape Town, 77,668 (with suburbs, 169,641); Kimberley, 34,331; Port Elizabeth, 32,959; East London, 25,220; Graham's Town, 13,877; Uitenhage, 12,193; Paarl, 11,293; Graaff-Reinet, 10,083.

EDUCATION. On June 30, 1908, there were 3,726 elementary schools, with 174,709 pupils. There are five government-aided colleges with 800 students, and an examining and degree-conferring university at Cape Town.

AGRICULTURE. Of the 177,376,660 acres comprised in the Colony, 43,568,697 acres had not been alienated in 1907. The production of wheat in 1907 was 2,000,000 bushels; maize, 3,000,000 bushels; oats, 3,000,000 bushels. There were about 30 flour mills, but South Africa does not produce wheat enough to keep six of them busy, and large quantities of wheat are imported. In 1907 the wheat imports amounted to 4,898,421 bushels, of which 3,971,576 came from Australia and New Zealand, 576,026 from Argentina, 117,600 from the United States, and 24,152 from Canada. The imports of wheat flour and meal in 1907 amounted to 33,990,528 pounds, of which Canada supplied 13,069,619, Australia 14,449,661, the United States 4,033,180, and Argentina 2,069,973. The grape-vine is extensively cultivated. In 1907 there were produced 2,541,613 pounds of raisins, 45,566 leaguers of wine (1 leaguer = 128 gallons), 10,673 leaguers of brandy, and 93,238 gallons of vinegar. The exports of fresh fruit—pears, peaches, plums, nectarines, grapes, melons, apricots, apples, pines, quinces, pomegranates—amounted to 172,738 cases in the 1908 season, against 82,355 cases in 1907 and 59,866 cases in 1906. Turkish tobacco has been successfully planted. In 1904 there were 1,934,390 cattle, 419,963 horses and mules, 11,818,829 sheep, 7,162,463 goats, 385,945 pigs, and 357,970 ostriches. The sheep farms frequently range from 3,000 to 15,000 acres and upwards. Wool, mohair, ostrich feathers, and butter are important products. Expert dairymen are employed by the government to travel among the farmers and instruct them in the best methods for making butter and cheese. The improvement in the domestic products has resulted in a decreased import of these articles. Several large coöperative creameries and butter factories have been established, aided by government loans at 4 per cent. interest. The value of the agricultural production of 1907 was estimated as follows: Cereals, \$7,213,939; vineyards, \$1,313,142; animal products, \$41,752,233; other products, \$4,866,000; fruit, \$378,127; giving a total of \$54,210,000. The value of live stock, based on estimates for natural increase since 1904, was estimated at \$127,804,000.

MINING, ETC. The mineral production of 1907 included: Diamonds, 2,580,954 carats, valued at £6,315,289; coal, 144,040 tons (2,000 lbs.

each), valued at £118,776; copper ore, 78,935 tons (2,240 lbs. each), valued at £601,824; tin ore, 144 tons (2,240 lbs. each), valued at £14,400; asbestos, 604 tons (2,000 lbs. each), valued at £9,060. In 1908 a rich tin formation was struck in the Tigerberg district; copper was discovered in the Upington district, in the northwest of the Colony, on the Orange River, the assays yielding 30 per cent. of metal; copper-nickel bearing ore was discovered in the Insizwa range, East Griqualand, near Mount Ayliff, the assays varying from 5 to 14 per cent. for copper and from 1 to 8 per cent. for nickel. In 1904 there were 2,527 industrial establishments, including flour and saw mills, tanneries, breweries, tobacco factories, etc., with 30,318 employees, plant and machinery valued at £2,180,336, and an annual product valued at £9,040,579.

COMMERCE AND COMMUNICATIONS. Cape Colony is a member of the South African Customs Union (See BRITISH SOUTH AFRICA). The special imports and exports in 1907 amounted to £16,928,000 and £47,087,000 respectively, against £18,200,124 and £39,629,679 in 1906. In 1907 the imports of foodstuffs were valued at £3,512,017; raw materials, £965,647; manufactures, £10,676,865. The principal exports in 1907 were: Gold, £28,228,000; diamonds, £8,983,000; wool, £2,535,000; ostrich feathers, £1,820,000; mohair, £915,000; hides and skins, £809,000; animals, £775,000; copper ore, £577,000; explosives, £501,000; cereals, £426,000. The trade with the principal countries of origin and destination in 1907 was as follows:—

From and to	Imports.	Exports.
Great Britain	£8,824,000	£42,885,000
Germany	843,000	709,000
British South Africa	2,408,000	2,994,000
Australia	1,066,000	10,000
United States	1,143,000	83,000

In 1907 the ports were entered by 2,607 ships of 11,653,454 tons (9,989,232 British), and cleared by 2,631 ships of 11,664,684 tons (9,995,149 British). The merchant marine consisted on Dec. 31, 1907, of 54 vessels, aggregating 5,842 tons. The length of government railways on Dec. 31, 1907, was 3,254 miles; of private railways, 461 miles. The capital expenditure on government railways to the end of 1907 was £31,919,340, the profit for the year being over 2½ per cent. The length of telegraph lines in 1906 was 8,200 miles.

GOVERNMENT, FINANCE, ETC. The executive power is vested in a Governor and Executive Council, appointed by the Crown, and a responsible ministry. The legislative power is vested in a Legislative Council of 26 members, elected for seven years, and a House of Assembly of 107 members, elected for five years. The franchise in both cases depends on a slight property qualification, but members of the Legislative Council must have immovable property to the value of £2,000, or movable property of £4,000. The number of registered electors in 1905 was 142,939. The colony proper is divided into 81 divisions, each with its elective council. The dependencies are divided into 30 districts. The colonial revenue is obtained chiefly from customs duties, licenses, public lands, and services rendered by the natives; in 1906 the last item amounted to

£4,559,435. In 1907-8 the total revenue was £6,981,308, and the expenditure, £7,955,156. The public debt at the end of 1907 stood at £46,267,290, nearly the whole of it contracted for public works. The military force of the colony at the end of 1907 consisted of 611 Cape mounted riflemen, exclusive of 57 natives, 5,093 volunteers, and 5,666 cadets. The Cape police numbered 1,265, of whom 181 were natives. In 1908 the Governor was Sir Walter Francis Hely-Hutchinson; the Premier, John X. Merriman.

HISTORY. In January, elections for the Legislative Council were held, giving a strong majority to the opposition, largely owing to the power of the Afrikaner Bund, and Dr. Jameson, who had been Premier since 1904, resigned (Jan. 31) and was succeeded by Mr. J. X. Merriman, the leader of the Bund and a strong advocate of federation of the five South African colonies, subject to the right of each to make its own tariff. He declared that the elections were a mandate to form a United South Africa and to adjust the finances of Cape Colony, and that the government would do its utmost to further these measures. The March elections to the Assembly also showed a heavy vote, and increased the power of the South African Party. As constituted after the January and March elections, the parties in the Houses of Parliament were distributed as follows: Legislative Council—South African Party, 15 (a gain of 5), Unionist, 5 (a loss of 5), Independents, 1; the Assembly—Ministerialists, 69 (a gain of 19), Unionists, 33, Independent, 5. An emergency session of the new Parliament was opened on Apr. 22 by the Governor, Sir Walter Hely-Hutchinson, to authorize expenditures to the close of the current financial year. At the beginning of the regular session, June 19, the Governor announced that the revenue and expenditure having failed to balance, Parliament must take measures to restore the equilibrium. Owing to the condition of the finances, he said, a number of public works had to be postponed. On June 30, the budget was introduced. The deficit was placed at £901,000. To meet this the government proposed the extension of the income tax to all incomes of £50 or over (afterwards raised to £100); the suspension of the sinking fund; the reduction by five per cent. of the salaries of civil service officers and members of Parliament; and the imposition of stamp duties and of an estate duty on absentee property owners. The Assembly passed the income tax proposal on Aug. 13th, but rejected the estate duty, in place of which the government proposed an extension of the present succession duty. The question of federation was debated in June and the Assembly passed a resolution favoring the early union of the colonies. In the sessions of the constitutional convention which met in the latter part of the year to draft a plan for a South African Union, the representatives of Cape Colony made it apparent that it could not go with the other colonies on the subject of the native franchise. In Cape Colony civilized natives vote; in the other colonies they do not, nor is there any disposition to give them the ballot. The probable outcome under federation appeared to be the retention by each colony of its own franchise, with guarantees to the Cape Colony against hostile future legislation in that direction. The wine bill, to facilitate the sale of light wines by the municipalities passed its third reading on Sept. 8th. It was

criticized on account of its omission of any local option clauses. See **BRITISH SOUTH AFRICA.**

CAPERS, ELLISON. A Protestant Episcopal Bishop, Diocese of South Carolina, died on Apr. 22, 1908. He was born at Charleston, S. C., on Oct. 14, 1837, and attended the South Carolina Military Academy, where after his graduation in 1857 he was for a short time an assistant professor. He joined the Confederate Army at the outbreak of the Civil War, entering as major and later becoming brigadier-general. In 1867 he was elected Secretary of State of South Carolina, but was forced out of office by the Reconstruction Act, one year later. He was ordained in 1867 and became rector of Christ Church, Greenville, where he remained, with the exception of one year, until 1887, when he went to Trinity Church at Columbia, S. C. In July 1893 he was consecrated seventh bishop of South Carolina, having previously declined (1886) the election as bishop of Eastern Maryland.

CAPE VERDE ISLANDS. A group of 14 islands in the Atlantic Ocean, west of Africa, constituting a Portuguese colony. Area, 1457 square miles. Population in 1900, 147,424 (3,856 whites). Porto Grande is the capital. Sugar, coffee, tobacco, indigo, millet, and southern fruits are cultivated. The imports and exports in 1906 amounted to 2,092,540 and 392,479 milreis, respectively (1 milreis = \$1.08). The revenue and expenditure for 1907-8 were estimated at 395,050 and 423,806 milreis respectively. The Governor in 1908 was B. S. Macedo.

CAPITAL PUNISHMENT. See **FRANCE** under *History*.

CARLOS I. King of Portugal, was assassinated in the streets of Lisbon, on the evening of Feb. 1, 1908. He was born in Lisbon, on Sept. 23, 1863, the oldest son of King Luiz I. and Princess Maria Pia of Savoy; married Maria Amelie, daughter of the Count of Paris, in May, 1886, succeeded to the throne upon the death of his father, on Oct. 19, 1889, and was crowned on Dec. 28. From the outset King Carlos's reign was a troubled one. He had at once to deal with the delicate question of boundaries between the Portuguese and English colonies in Southeast Africa, and his obviously friendly attitude toward Great Britain did not please his people. The financial and economic condition of Portugal was bad, and grew steadily worse, thanks to secret alliances between the party in power and the leaders of the nominal opposition. Under this system corruption of all kinds flourished, the burden of taxation grew constantly heavier, and the public debt rapidly increased. For all this King Carlos was held at least indirectly responsible by an increasing number of his subjects. In 1892, the new cabinet under Ferreira confronted the absolute necessity of increasing taxation and cutting down expenditures, but though the King aided in this retrenchment by assenting to a reduction of the civil list by which 20 per cent. of the income of the royal family was cut off, and even issued a royal decree reducing the interest on the public debt, his popularity was not enhanced; and in 1893 an attempt was made to assassinate him. The establishment in 1905 of the tobacco monopoly in favor of the government intensified the discontent, especially when it became apparent

that public officials were growing rich from this new source of public plunder.

In May, 1906, João Franco formed a new cabinet, and at once instituted a series of sweeping reforms in the interest of public economy and official integrity, only to be met, of course, by violent opposition from the office holders. King Carlos supported all of Franco's measures, and stood resolutely behind him in the enforcement of his reform policies, and in May, 1907, when the Chamber was dissolved, virtually proclaimed a dictatorship, vesting Franco and his associates with enormous power. With the stoutly avowed approval of Carlos, Franco used his dictatorial powers with the utmost ruthlessness, and with the result that both incurred the deadly hatred of the office-holding corruptionists, who grew desperate under the relentless reform methods of Franco. The assassination of Carlos and his son was accomplished while the royal family were being driven, in an open carriage, across the city, on their return from a fair at Villa Viçosa. As the carriage—which had no escort of troops or police—reached the centre of the Praco do Comercio, one of the chief squares of the city, the party were set upon by the assassins, some of whom stopped the horses, while others opened fire with carbines which they had concealed under their cloaks. The King was struck three times, and finally almost instantly killed by a ball which severed the carotid artery. The Crown Prince received wounds from which he died within a few minutes, and Prince Manuel was slightly wounded. During the assault, the Queen displayed great bravery, attempting to shield her sons with her own body, and even trying to beat off one of the assassins by striking him repeatedly in the face with her bouquet of roses. In the affray, three of the assassins were killed, and several persons were wounded by the soldiers and police. LUIZ PHILIPPE, Duke of Braganza and Crown Prince of Portugal, who was also almost instantly killed, was born in Lisbon, on Mar. 21, 1837. He had displayed many of the amiable qualities of his father, and also considerable tact and discretion in the political matters that had been entrusted to him. See PORTUGAL, and MANUEL II.

CARMACK, EDWARD WARD. An American politician, was assassinated at Nashville, Tenn., on Nov. 9, 1908. He was born in Sumner County, Tenn., on Nov. 5, 1858, began the practice of law at Columbia in that State, was elected to the Legislature in 1884, and subsequently became interested in journalism. He edited the *Nashville American* from 1888 to 1892, and in that year became editor of the *Memphis Commercial*. He represented the Memphis district in Congress in 1897-1901, and was United States Senator from Tennessee from 1901 to 1907. In the Senate he made a reputation as a brilliant debater, and was one of the strongest opponents of the administration policy in the Philippines. He was defeated for reelection in 1907. His last service in the Senate was in "talking out" the session of 1906-7 to prevent the final passage of the Ship Subsidy Bill. In 1906 he made a bitter contest against Governor Patterson for the Democratic nomination for governor on the platform of state-wide prohibition, but was defeated. His assassination by Robin J. Cooper on the streets of Nashville was supposed to have been caused by bitterness engendered by this fight (see TEN-

NESSEE) and intensified by editorials published in the *Tennessean*, of which Senator Carmack was editor.

CARNEGIE FOUNDATION. See UNIVERSITIES AND COLLEGES.

CARNEGIE INSTITUTION OF WASHINGTON. An institution established in 1902 by endowment from Andrew Carnegie for the encouragement of investigation, research, and discovery. The original endowment, \$10,000,000, was increased in December, 1907, by \$2,000,000 additional. The Institution maintained during 1908 a desert botanical laboratory at Tucson, Arizona; a station for experimental evolution at Cold Spring Harbor, New York; a marine biological laboratory at Tortugas, Florida; a department of terrestrial magnetism and a geophysical laboratory at Washington, D. C.; a solar observatory on Mt. Wilson, California; and departments for historical research, economics, and sociology. A nutrition laboratory at Boston, near the Harvard Medical School, was also completed during the year, while an appropriation was made to build a non-magnetic sailing vessel with auxiliary power for magnetic observations on the Atlantic Ocean. The horticultural work of Mr. Luther Burbank and a department of astrometry were also included in the major projects of the Institution. A large number of minor projects and research associates and assistants also received allotments. The publications of the Institution since its foundation have numbered 120, and of these, twenty-eight volumes with 2,485 quarto and 4843 octavo pages were published during the year 1907-8. At the annual meeting of the Board of Trustees in Dec., 1908, Dr. Charles W. Eliot of Cambridge, Mass., and Mr. Martin A. Ryerson of Chicago were elected to fill vacancies in the board. Dr. Robert S. Woodward is the president of the Institution.

CARNEY, WILLIAM H. A Civil War veteran, color-sergeant of the famous Fifty-fourth Massachusetts, the first negro regiment to be enlisted in the Civil War, died at Boston in Dec., 1908. He had been employed there as a messenger in the State House for many years. Carney carried the national flag in the assault on Fort Wagner, S. C., on July 19, 1863, and reached the parapet of the fort by the side of Colonel Shaw who was killed there. Although twice wounded he never lost his hold on the colors.

CAROLINE ISLANDS. A group of islands in the eastern Pacific, north of New Guinea and southeast of the Philippines, a German possession. Area, including the Pelew Islands to the west, 560 square miles. Population, 41,400. In 1907 there were 137 whites (83 Germans). In 1906 the imports amounted to 85,000 marks; the exports, chiefly copra, 427,000 marks. The Caroline and Pelew Islands are attached to German New Guinea (q. v.). They are divided for administrative purposes into the Eastern Carolines, with the seat of government on the island of Ponapé, and the Western Carolines (including the Pelew Islands and the Ladrone Islands (q. v.), with the seat of government on the island of Yap.

CASTRO, CIPRIANO. See VENEZUELA; HOLLAND; UNITED STATES.

CATHOLIC UNIVERSITY OF AMERICA, THE. A Roman Catholic institution of higher learning at Washington, D. C., founded in 1885.

It has the faculties of philosophy, letters, sacred science, law, and sciences. In 1902 an extensive undergraduate department was opened to courses leading to the degrees of A.B., B.L., B.S., Ph.B., etc. The following non-affiliated undergraduate colleges are connected with the University; Marist, Juniorate, and the College of St. John Canty, just established. There were in 1908 224 students and 31 professors. The library contains 52,565 volumes. The total productive funds, benefactions, and receipts of all kinds at the end of the fiscal year, ending June 30, 1908, amounted to \$2,378,541.89; the income from endowment funds amounted to \$24,971.82.

CATTLE. See STOCK RAISING.

CAUSEWAY. A concrete causeway across Galveston Bay was proposed, during 1908, the building of which is to be undertaken by the railway companies in conjunction with the City. It was to be 10,280 feet long, average 15 feet above high tide, be 100 feet wide, have 4 railway tracks, a driveway, and sidewalks, and will cost \$1,400,000. The County was to pay one quarter, the electric railways between Houston and Galveston the same, and the steam roads one half.

CAVALRY. See MILITARY PROGRESS.

CAYENNE. See FRENCH GUIANA.

CAYMAN ISLANDS. British islands in the West Indies, administratively attached to Jamaica (q. v.). Area, 225 square miles; population (1906), 6,000. Cocoanuts, turtle-shell, and cattle are exported. The administration is by a Commissioner.

CEMENT. The United States Geological Survey at the close of 1908 estimated the production of Portland cement in the United States for the year as somewhat less than forty million barrels. This compares as follows with the output of recent years:

1905	35,246,812 Barrels.
1906	46,463,424 "
1907	48,785,390 "
1908 (estimated) ..	40,000,000 "

The falling off from the 1907 output was heavy, and was particularly notable because it was the first decrease shown in any year by the American cement industry since its inception. The decrease was not uniformly distributed throughout the country, for New York, Pennsylvania, and New Jersey showed the greatest losses, while in some portions of the West and the Middle West the decrease was relatively slight. The total maximum capacity of existing plants at the end of the year was about 60,000,000 barrels.

During the year several small companies went into the hands of receivers and the financial stress also led to a change of control in a group of plants operating chiefly in the Pacific States. A fortunate effect of the depression was that it put a stop, temporarily, to the flotation of fraudulent or doubtful cement securities; though with improvement in general business conditions it was thought likely that promotion schemes would again be taken up on an even larger scale than before the depression. Despite the business depression, or perhaps partly because of it, there were a number of important technical and industrial developments in the cement industry during 1908, and others were pending at the end of the year.

CENSUS. See UNITED STATES.

CENTRAL AMERICA. The establishment of a Central American Court of Justice was a most important achievement of the Washington Peace Convention, which sat from Nov. 14 to Dec. 18, 1907. On May 26, 1908, the court was opened at Cartago, Costa Rica, in the presence of representatives from all the Central American republics, as well as the United States and Mexico. The day was celebrated as a national holiday throughout Central America. The United States Commissioner, Mr. William I. Buchanan, announced the gift of \$100,000 from Andrew Carnegie for the building of the temple as a seat for the court. An important case was brought before the court in July by Honduras and Nicaragua against Salvador and Guatemala. President Davila of Honduras presented a charge that the revolt of July, 1908 (see HONDURAS), was organized and supported in the neighboring republics of Guatemala and Salvador. At the same time President Zelaya of Nicaragua made similar charges. The latter's claims were dismissed as lacking foundation. The Honduran claims were examined at length and they were decided adversely in December. This was taken as a sign of the effective manner in which the court served the purpose for which it was designed. The differences here adjusted peacefully were of the class that formerly had often led to hostilities.

See COSTA RICA; GUATEMALA; HONDURAS; NICARAGUA; SALVADOR; and INTERNATIONAL BUREAU OF AMERICAN REPUBLICS.

CEYLON. An island of the Indian Ocean, situated southeast of the Indian Peninsula, a British crown colony. Area, 25,332 square miles. Population (1901), 3,565,954; estimated at the end of 1906, 3,984,985. The Maldiv Islands, a dependency of Ceylon, have an area of 115 square miles and a population of 30,000. The population of the principal cities in 1901 was: Colombo, the capital, 158,228; Galle, 37,316; Jaffna, 33,879; Kandy, 26,519.

PRODUCTION. About one-fourth of the island is under cultivation. The area planted in rice in 1907 was 688,824 acres; other grains, 110,598; tea, 438,243; coffee, 2,433; cocoanuts, 993,831; rubber, 115,676; cinchona, 1,229; cinnamon, etc., 44,380; cacao, 37,050; tobacco, 16,235. About 385,000 acres of the total area under tea is in plantations, the remainder being in small gardens owned by natives. About 1,200 Europeans are employed as managers and assistants on the large tea estates and factories. The plantation labor is performed by about 400,000 Tamil coolies and women imported from the Malabar coast, India. Their daily wage varies between 8 1-3 and 11 2-3 cents, besides housing and rice furnished at cost. The natives prefer working their buffalo teams for hire or on their own rice fields to plantation labor, but several thousand of them are employed in transporting tea to the railways and supplies to the estates. The recent extension of rubber plantations in the Federated Malay States, in the Straits Settlements, and in Ceylon itself, has so increased the demand for Tamil labor that Ceylon tea planters have found the supply inadequate, and a government commission was appointed for the purpose of devising, if possible, a labor system satisfactory to both planters and coolies. By the middle of 1908 the commission had not yet made its report. The exports of tea in 1907 amounted to 179,844,827 pounds (a gain of 9,316,336 pounds over 1906), valued at \$24,-

878,535. The average price per pound was 1.78 cents over that prevailing in 1906. The value of the tea export was 58.7 per cent. of the total exports in 1907. The distribution of the tea export of 1907 was as follows: Great Britain, 111,485,802 pounds; Australasia, 23,789,666; Russia, 19,670,490; China (for blending), 7,699,129; Canada, 6,161,602; United States, 5,528,297; Germany, 578,881; France, 461,845.

The fall in the price of tea and the rise in the price of rubber have greatly stimulated the cultivation of the latter. In 1904 there were 25,000 acres under rubber trees, with 600 acres in bearing; in 1905, 40,000 and 1,000 acres respectively; in 1906, 100,000 and 2000; in 1907, 150,000 and 2,500; while for 1908 the estimate for planting was 10,000 acres, and 120 acres were expected to begin to bear. The figures are only approximate, as for many estates tea and cacao are interplanted with rubber. The recorded exports of Ceylon rubber are: 1904, 35 tons; 1905, 75 tons; 1906, 150 tons; 1907, 397 tons; 1908 (Jan. 1—May 11), 113 tons. The capital invested in rubber planting is roughly estimated at \$9,000,000. The labor force is estimated at 250 Europeans and between 75,000 and 100,000 Tamil coolies. The recent rise in the price of camphor has resulted in the establishment of a new industry. The camphor tree thrives in the mountainous parts of the islands at an elevation of from 2500 to 8000 feet. It was estimated that the planting of between 15,000 and 20,000 acres in Ceylon would yield 8,000,000 pounds, or about the entire present demand of the world-market for camphor. The rapid growth of the twigs and the cheapness of land and labor are the factors depended upon by planters to give Ceylon an advantage over other camphor-producing countries. In 1906 the camphor acreage was increased from 142 to 1,106, and it was expected to increase still further in 1908. The export of camphor in 1907 was 562 pounds. The export of other products in 1907 was as follows: Cinnamon, 5,777,962 pounds; cardamon, 765,470 pounds; desiccated cocoanuts, 22,359,138 pounds; cotton, 317,563 pounds; cacao, 88,180 cwts.; coffee, 1,843 cwts.; coir, rope, etc., 296,338 cwts.; ebony, 1,154 cwts.; poonac, 208,957 cwts.; cinnamon oil, 97,229 ounces; citronella oil, 1,230,159 pounds; cocoanut oil, 460,683 cwts. In 1906 the live stock consisted of 3,743 horses, 1,542,909 horned cattle, 95,389 sheep, 177,425 goats, and 99,495 pigs. There is a government dairy and model farm, and efforts are made to improve the native breeds of cattle, sheep, and pigs by crossing with imported animals. In 1906 there were 951 plumbago or graphite mines. The export of plumbago began to fall off in the second half of 1907, the total shipments for the year amounting to 650,116 cwts., valued at \$2,968,863—a falling off of 51,729 cwts. from 1906. There were in 1908 no great stocks above ground, and prices remained steady, but most of the mine owners suspended production. Of the 1907 exports of plumbago the United States took 290,417 cwts.; Great Britain, 169,857; Germany, 100,012; Belgium 75,825 cwts. In 1906 there were 7,226 gem quarries. The pearl-fisheries are a government monopoly, leased to a company for 20 years from Jan. 1, 1906, at an annual rent of 310,000 rupees. The yield of the pearl-fisheries in 1907 was valued at \$343,248, against \$445,581 in 1906, which was the best year on record. The manufacture of

salt, another government monopoly, yielded a revenue of Rs. 1,737,871 in 1907.

COMMERCE AND COMMUNICATIONS. The imports and exports in 1907 were valued at Rs. 129,316,757 and Rs. 129,570,001 respectively, against Rs. 123,502,921 and Rs. 112,516,914 in 1906 (1 rupee=32.44 cents). The principal imports in 1907 were, in rupees: Coal and coke, 10,549,944; cotton manufactures, 8,460,032; rice, mainly from British India, 40,984,967; sugar, 3,135,623; manures, 3,689,274; coin and bullion, 9,254,823. The principal exports in 1907 were, in rupees: Areca nuts, 2,415,047; cinnamon, 3,045,708; cacao, 5,232,193; cocoanuts, 904,536; desiccated cocoanuts, 4,471,427; coffee, 203,941; coir, 2,537,163; copra, 5,322,464; citronella oil, 1,386,078; cocoanut oil, 11,830,324; plumbago, 8,906,589; tea, 74,635,605; unmanufactured tobacco, 928,824; coin and bullion, 201,750. The trade with the principal countries of origin and destination in 1907 was as follows, in rupees:

From and to	Imports.	Exports.
Great Britain	Rs. 32,720,989	Rs. 65,932,672
British India	69,018,578	7,099,982
Canada	5,842	2,608,267
Other British Colonies	12,928,178	12,741,485
France	757,612	733,098
Germany	2,921,136	8,202,674
United States	1,002,406	11,814,331

The length of railway in 1906 was 562 miles; of telegraph lines, 1,652 miles. The marine on Jan. 1, 1907, consisted of 8 steamers, of 982 tons, and 143 sailing vessels, of 10,972 tons.

GOVERNMENT AND FINANCE. The colony is administered by a Governor—in 1908, Colonel Sir Henry E. McCallum—assisted by an Executive Council of five officials and a Legislative Council of nine officials and nine unofficial members. The British troops in 1908-9 numbered 1,166. There is a volunteer force of about 2,500. The cost of the garrison is borne by the colony. The revenue and expenditure in 1907 were Rs. 36,573,844 (Rs. 9,677,880 from customs) and Rs. 35,291,521 respectively. The public debt, incurred entirely for railways and public works, stood in 1907 at £4,602,570 and Rs. 3,125,562.

The chief measures before the Legislative Council during its session (Aug. 20 to Nov. 20, 1908) concerned the public works, including the Mannaar railway, drainage, and the commercialization of Colombo lake; also a project for the closing of all licensed opium dens and for placing the regulation and distribution of the drug under the control of the medical department. Action on it was deferred till February, 1909. Opium-users were estimated at 10 per cent. of the population.

CHADWICK, HENRY. An American newspaper writer and editor, popularly called the "Father of Baseball," died on April 20, 1908. He was born at Exeter, England, in 1824 and came to the United States when but thirteen years old. He early became prominent as a writer on sporting topics, especially cricket and baseball, serving first in the capacity of reporter and later in his career in that of editor. He edited *Spalding's Baseball Guide* for several years.

CHAFIN, EUGENE WILDER. Presidential candidate of the Prohibition party in 1908, born at East Troy, Wis., on Nov. 1, 1852. He was educated at the University of Wisconsin, receiv-

ing the degree of LL.B., and for twenty years practised law at Waukesha, Wis. In 1901 he moved to Chicago, expecting to continue his law practice, but became interested in platform speaking and campaign work. In July, 1908, he was nominated for President by the National Prohibition Convention, held at Columbus, Ohio, and in the election received a popular vote of 248,881. Mr. Chafin has devoted considerable time to the study of American history and is the author of *Lincoln: The Man of Sorrows*. See **PRESIDENTIAL CAMPAIGN**.

CHAMBERLAIN, GEORGE EARLE. An American political leader, Governor of Oregon (Democrat) from 1902 to 1909; born near Nathez, Miss., on Jan. 1, 1854. He graduated at Washington and Lee University in 1876, receiving degrees both from the classical and the law departments. After graduation he moved to Oregon, where he began his law practice and entered politics. In 1880 he was elected a member of the State Legislature, and in 1884 was chosen district attorney for the third judicial district. He became attorney-general by appointment in May, 1891, and the following year was elected to that office, which he held until 1895. In 1900 he was elected district attorney for the fourth judicial district, but resigned the position upon his election to the governorship in 1902. In 1906 he was reelected Governor, and in June, 1908, by direct primary was endorsed for United States Senator. This endorsement, however, must be ratified by the legislature, which convenes in Jan., 1909. But, inasmuch as a majority of the legislators pledged themselves to carry out the wishes of the people as expressed in the direct primary, the election of Mr. Chamberlain to the Senate was practically assured. See **OREGON**.

CHAMBERLAIN, JACOB. An American missionary of the Reformed Dutch Church, died on Mar. 2, 1908, at Mandanapalle, India. He was born on April 13, 1835, at Sharon, Conn., graduated at the Western Reserve College in 1856, at the Reformed Theological Seminary, in New Brunswick, N. J., in 1859, and in medicine at the College of Physicians and Surgeons, New York, and the Western Reserve Medical College. In 1859 he went to the Arcot mission, in Southern India, as a medical and evangelistic missionary. He established the mission and hospitals at Mandanapalle, and also the hospital at Palamanir, and was engaged in mission work at Mandanapalle until 1901, after which he devoted himself to the study of the Telugu and Tamil languages. He was chairman of the committee which produced a new version of the Bible in Telugu (1873-94), and he translated the liturgy of the Reformed Church into that language, and also prepared a Telugu hymn book, and an Oriental Bible Dictionary.

CHARITY ORGANIZATION. Recent years have witnessed in the United States a decided tendency toward a more perfect organization of charitable efforts. This has resulted not only in the unification of the charitable work of religious denominations but also in the centralized organization of non-denominational activities. Moreover through the National Conference of Charities and Corrections, both denominational and non-denominational charitable activities have been more or less unified and animated by a more intelligent spirit. The recognition that an exact knowledge of conditions and a more intimate acquaintance with causes are fundamental both

to an intelligent treatment of the results of poverty and a scientific prevention of its causes has been the keynote of many recent efforts and particularly of those of the Russell Sage Foundation. The year 1908 saw the organization of new societies for the centralization of charitable efforts in many American cities. Everywhere there was shown a tendency to secure trained officials for such work. As a means of training workers and spreading a knowledge of the principles of relief, schools of philanthropy have been called into existence in New York, Boston, Chicago and St. Louis. The scope of present day activities is very broad, including not only the relief of the poverty stricken and the finding of employment for those out of work, but also the betterment of housing and working conditions; the care of children in the home, the school and the factory; the safeguarding of female workers; the improvement in the conditions and care of all those unfortunates housed in public institutions; the better education and training of prisoners, their more humane treatment and the betterment of their opportunities after release.

Recently established benefactions, including the General Education Board, the Carnegie Institution, the Carnegie Fund for the pensioning of teachers, the Rockefeller Institute, the Russell Sage Foundation and the Jeanes Fund for the Primary Education of Negroes, now amount to almost \$100,000,000.

The thirty-fifth National Conference of Charities and Corrections was held at Richmond, Virginia, in November. President Murley will be succeeded next year by Ernest P. Bicknell. The next Conference will be held at Buffalo. Since the Conference has outgrown its original purposes, a committee was appointed to consider the advisability of forming a federation of the philanthropic societies of the country with provision for sectional meetings of those having kindred interests. Among the topics discussed either by the Conference as a whole or by sectional meetings were, the advancement of social work among the isolated mountain folk of the South; the influence of environmental conditions on children in cities of various sizes and characters: the care of juvenile delinquent (q. v.) unemployment (q. v.); the use of the wood-yard as a test of good faith; labor colonies; prison reform, with emphasis on various judicial reforms for both juvenile and adult cases, on reclaiming the delinquent, and on the extension of the indeterminate sentence, parole and probation systems (See **PENLOGY**); the defective classes, their intelligent classification as a means of better care and training for each type, the permanent custodial care for serious cases and a scientific investigation to determine causes and means of prevention. In the section devoted to the insane and epileptic, New York's care of its dependents was described. Dr. Ferris of the State Lunacy Commission cited cases of recovery after ten years and stated his belief that many so-called chronic cases were merely protracted cases capable of recovery. Greater publicity for the various philanthropic activities now being supported was advocated and approved. In the denominational sections the reports showed that the year had been one of unusual activity and difficulties, but nevertheless one of commendable success.

State conferences of a similar sort were held during the year in Indiana, Illinois, Kansas, Maine, Massachusetts, Minnesota, Missouri, New

Hampshire, New York, Ohio and some other States. The reports showed a tendency to specialize on subjects of especial local interest. In Indiana marked attention was given to the housing problem and the introduction of more sanitary conditions into the crowded cities. (See POPULATION, CONGESTION OF.) In Illinois the administration of almshouses and similar institutions and the conditions of health in jails and penitentiaries caused wide-spread discussion. Cook County in that State erected a new \$2,000,000 infirmary. In Kansas subjects discussed included meagreness of funds, political meddling and a comparison of the plan of caring for children in public institutions and the plan of placing them out in private families. In New York and Massachusetts, tuberculosis (q. v.) and congestion of population (q. v.) were the principal topics of discussion. Charity organization in both of these States, and especially in New York City and Boston, have shown great favor for public exhibits, which set forth in a realistic manner conditions of life and labor among the poorer classes. In 1908 tuberculosis and congestion exhibits of far-reaching influence were held in New York. In both New York and Ohio the subject of blindness was considered. Dr. F. Paul Lewis of the Batavia State School for the Blind in New York declared that as many as 60,000 cases of blindness in the United States were preventable, the majority of them being due to syphilis. In the Ohio conference it was declared that 58 per cent. of the cases of blindness in that State were preventable. In Massachusetts was held an exhibit showing the work done by the blind in the schools of the State.

At the fall opening of the New York School of Philanthropy almost 100 students were enrolled, representing 15 States, the District of Columbia, Italy, Canada and Cuba. The Chicago School of Civics and Philanthropy registered 60 students at its opening. The research department of the School will study the housing problem in Chicago. The Boston School of Social Workers opened with a class of 52, part of whom were State and municipal officials. The St. Louis School of Philanthropy started with a class of 22. Among the objects to be investigated are the milk supply and medical care of school children. This school is directly a result of the Russell Sage Foundation, which contributes also to the eight fellowships of its research department. Among special activities of the year may be mentioned the agitation by the National Consumers' League to induce the American people to do their Christmas shopping as early as possible. This was designed as a measure of protection for the thousands of women and children who work long hours in retail and department stores during the holiday season. This same organization took measures to protect children from cheap and injurious Christmas candies. Probably the most important investigation of the year was that of housing and labor conditions at Pittsburg and vicinity by representatives from the Charity Organization Society of New York. (See VAGRANCY and PENOLOGY.)

CANADA. The Ninth Canadian Conference of Charities and Corrections was held in Toronto, Nov. 25-26. The Province of Ontario was alone well represented. The Superintendent of the Ohio State Reformatory at Mansfield, Mr. J. A. Leonard, presented the plans of that reforma-

tory. His visit was of especial moment since the Province contemplates the construction of a reformatory on some such plan. The discussion included the subjects of county poor-houses, care of the feeble-minded, and the indeterminate sentence. The discussion brought out the statement that 50 per cent. of the insane population of the Dominion have come in recent years from Great Britain.

SWEDEN. The Commission appointed in 1905 for the study of social conditions by the Central Association of Social Workers reported in April. They recommended a revision of the Law of 1870 giving the care of the poor to the parish so that individuals needing aid may obtain it; the raising of the minority age from 15 years to 18 years in order to give poor guardians more authority; the prohibition of outdoor relief to drunkards and chronic idlers; work-houses for able-bodied paupers; separate wards for children; and the care of nursing mothers in separate wards. A committee of voluntary workers under state supervision was advised to oversee and control public and private charities. It was recommended that temporary relief should be given with the understanding that the recipient should pay it back in small instalments according to his circumstances. The Commission declared that non-supporters and deserters should be forbidden to migrate, and in cases of refractoriness, imprisonment or detention was recommended.

CHARTERIS, ARCHIBALD HAMILTON. A Scotch clergyman, emeritus professor of Biblical criticism in the Edinburgh University, died on Apr. 24, 1908. He was born in Wamphray, Dumfriesshire, on Dec. 13, 1835; graduated at Edinburgh University in 1852, and in 1858 was licensed a minister of the Church of Scotland. In 1862 he succeeded Dr. Caird, as pastor of Park Church, Edinburgh, and in 1868-96 he had the chair of Biblical criticism in Edinburgh. Dr. Charteris was one of the most active supporters of the Scotch Church Patronage Bill of 1874, which provided for the "abolition of all church patronage from the Crown downwards, and the creation of a constituency by whom the minister of a congregation might be selected." His most important literary achievement is his *Life of Professor James Robertson* (1863; 2d. ed., 1897); and he also published: *Canoncity, or Early Testimonies to the Books of the New Testament* (1881); *The Christian Scripture* (1888); and *The Church of Christ* (1905).

CHAUTAUQUA INSTITUTION. A system of popular education, founded at Chautauqua, New York, in 1874 by Lewis Miller and John H. Vincent. The local work of the Institution is done in connection with a summer Assembly and a series of Summer Schools. The Assembly of 1908 covered a period from July 2 to Aug. 30, during which sixty days an open programme of concerts, entertainments, readings, lectures, and addresses, numbering 1000 events or more, was conducted for the benefit of slightly over 50,000 visitors. The Summer School lasted from July 4 to Aug. 14, approximately 200 courses being offered by 90 instructors to a total registration of 3263, or 2716 without duplicates. Boys' and Girls' clubs with respectively 300 and 350 members, a Kindergarten with 50 members, furnish systematic recreation and instruction for the young residents. Courses for adults regularly taken in English, psychology and pedagogy,

music, arts and crafts, expression and physical education, are most largely attended. In 1909 the Arts and Crafts department goes into new and complete quarters on College Hill. The fire of Oct. 19, 1908 which practically destroyed the business block has resulted in the rebuilding of this commercial centre and in the supplementary erection of a Post Office and Print Shop. The total cost of the two buildings approximates \$75,000. One of the most important departments of the Institution is the Chautauqua Literary and Scientific Circle, which maintains home reading courses throughout the year. The subjects treated in these courses are American, English, Modern European and Classical, and they constitute a four years' course in history, literature, biography, travel, art, national institutions and life. Certificates, diplomas and seals are given for prescribed reading and answering review questions. Some seventy additional special courses of reading are outlined and recommended. The number of persons taking these courses in 1908 were 25,000, of whom 17,750 were women, and 7250 men. Since the organization of the Circle over 300,000 readers have been enrolled, and nearly three times that number have read parts of the home study courses. Circles are maintained in every State and Territory of the Union, in Canada, India, Mexico, South America, Hawaiian Islands, West Indies, Japan, and countries of Europe, Asia and Africa.

CHEESE. See DAIRYING.

CHEMICAL SOCIETY, AMERICAN. A learned society, founded in 1876. Two meetings were held during the year, one in New Haven in June, and one in Baltimore from Dec. 29 to Jan. 1, 1909. The latter meeting was in affiliation with the American Association for the Advancement of Science and the Biological Section of the society held a joint session with the Society of Biological Chemists. The sections represented and their respective chairmen were as follows: Agriculture and Food Chemistry, H. J. Wheeler; Biological Chemistry, J. J. Abel; Inorganic Chemistry, C. H. Herty; Organic Chemistry, S. F. Acree; Pharmaceutical Chemistry, Edward Kremers; Chemical Education, H. P. Talbot; Fertilizer Chemistry, F. B. Carpenter; Physical Chemistry, G. M. Lewis. The Division of Industrial Chemistry and Chemical Engineers also held a meeting. The year 1908 was one of the most successful in the history of the society, and its membership was largely increased. It now approximates 4,000. The Society publishes three journals, the *Journal of the American Chemical Society* in its 30th volume; *Chemical Abstracts*, now in its third volume, and the *Journal of Industrial Chemistry and Chemical Engineering*, which was to begin Jan. 1, 1909. *Chemical Abstracts* supplies the place to the English speaking world that *Chemisches Zentralblatt* occupies with German chemists. It abstracts over 400 periodicals annually and has met with immediate recognition and success. The President of the Society is Marston T. Bogert and the Secretary, Charles L. Parsons, Durham, N. H.

CHEMISTRY. GENERAL PROGRESS. The year 1908 was marked by no single discovery or investigation of epoch making character within the field of pure or applied chemistry. At the same time, a large amount of very import-

ant work was published as the result of the labors of an army of investigators that is growing at a rapidly increasing rate. The most striking feature of this mass of new material was found in the well-nigh universal application of the so-called physico-chemical methods to all branches of chemical investigation. The devotees of the various branches of chemistry were never more highly specialized, and yet these different groups were being brought more closely together than ever before by the prevailing and constantly increasing use of the methods of physical chemistry. Indeed, the term "physical chemistry" is almost a misnomer, for it is becoming increasingly difficult to define its limits. It is this fact that leads many to prefer the term "general chemistry."

Within the field of pure chemistry, the subject of radio-chemistry continues to attract much attention, and the application of more exact methods of quantitative measurements has brought about a revision of some of the views formerly held.

The application of chemistry to the arts and to the various manufacturing industries continued to increase at a rate that promised well for the future. The rank of a nation in the race for industrial supremacy is certain to be determined in no small measure by the degree to which it takes practical advantage of the increase in scientific knowledge. American manufacturers were beginning to realize the importance of this aid and were making constantly increasing demands for well trained chemists. By 1908 several large manufacturers had established research laboratories under the direction of able men who had been thoroughly trained in the methods of chemical research. So great was the demand for competent chemists for this work, and so large were the financial inducements offered, that it was becoming increasingly difficult for educational institutions to secure chemists of first class ability for teaching positions.

The NOBEL PRIZE awards for 1908 (see NOBEL PRIZE) showed the somewhat remarkable case of the chemistry prize given to a physicist. The award called attention to some of the difficulties that seemed likely to arise not infrequently in the future. The original conditions of the award stated that the prize shall be given annually to the investigators who shall be considered to have made the most notable contributions in the several branches during the past year. Heretofore the chemistry prizes certainly had not always been given in strict accordance with this provision, but had been given, regardless of recent work, to men who long before had achieved distinction. Professor Ernest Rutherford to whom the chemistry prize was given in 1908 was a physicist and the work in which he has achieved distinction is rather more physical than chemical. Rutherford was one of the ablest authorities upon the subject of radio-activity, and his work had contributed probably more than that of any other single individual to the general knowledge of this subject. His work dealt more, however, with the physical than with the purely chemical aspects of the subject. It was another striking example of the rôle that the so-called physical chemistry was playing in abolishing the boundary between physics and chemistry.

NEW ELEMENTS AND ATOMIC WEIGHTS. The only new elements given official recognition

by the International Atomic Weights Committee in 1908 were Neoytterbium and Lutecium. In 1907 Urbain announced the existence of these elements as constituents of Ytterbium. Further work confirmed the fact that the so-called element Ytterbium was not really an element, but a mixture of these two substances. Their elementary nature was proved also independently by A. von Welsbach, who proposed the names Aldebaranium and Cassiopeium. Urbain seems to have the best claim to priority of announcement, and his nomenclature will undoubtedly be adopted. The International Committee on Atomic Weights announced a revision of the authorized atomic weight values in accordance with the most recent work upon some of the fundamental values, especially those of silver, chlorine, bromine and nitrogen. There seemed to be no question that the old value of Stas for silver was too high, and that the true value was not much above 107.88. This number was adopted in the revision. The value to be assigned to nitrogen was also the subject of much interest during the past. The work of Richards published in 1907 was supplemented by further work on the analysis of ammonium chloride. From this work Richards obtained the value of 14.008 for nitrogen, 107.881 for silver, and 35.457 for chlorine. These values, rounded off to two decimals, are identical with those adopted by the International Committee. The use of these values, with 79.916 for bromine, introduced many slight changes in the previously accepted values, especially among the more accurately determined elements. These changes are mostly slight, such as 137.37 instead of the old 137.44 for barium, and 63.57 in place of 63.60 for copper. The work of Baxter and Wilson upon the analysis of lead chloride has resulted in the value of 207.10 for lead, considerably higher than the old figure. Mme. Curie's latest value for radium, 226.4, is considered to be the best so far obtained, and is introduced in place of the old 225.

During the year 1908 the question of the exact application of the law of the conservation of weight to chemical reactions was considerably discussed. It was suggested that sufficiently exact work would show slight changes of weight involved in chemical reactions, the gain or loss of weight possibly corresponding to loss or gain of energy by the reacting substances. Landolt showed very conclusively that this is not the case, but that the law holds strictly true in so far as it applies to chemical reactions.

HELIUM. Professor Onnes of Leiden announced that he had succeeded in liquefying helium. All previous attempts by Dewar, Olsceviski, and others had failed with this gas, chiefly on account of an inadequate supply of helium. Onnes announced that at a temperature of 4.5° absolute he had obtained condensation.

RADIO-CHEMISTRY. While most of the work upon radio-activity had been of a purely physical nature, the purely chemical effects received considerable attention. In 1907 Professor Ramsay made the startling announcement that by the action of radium on copper sulphate solution he had succeeded in transforming copper into lithium and sodium. Other investigators at once attempted to confirm this statement, thus far unsuccessfully. Ramsay himself, using greater precautions, was unable to repeat his original work. Mme. Curie likewise obtained negative results but stated that "it is impos-

sible to affirm that no trace of sodium or lithium was formed in the experiment. We believe, however, that formation of these elements cannot be considered as established fact." Rutherford found no trace of lithium on repeating Ramsay's experiment. Ramsay in his earlier work also claimed that neon is produced by the action of radium emanation on water. Rutherford was unable to find a trace of neon. It seemed fairly well established, therefore, that the much heralded transformation of elements does not occur in this instance at least.

The existence of the element ionium as a fugitive intermediary body between uranium and radium as discovered by Boltwood in 1907, was confirmed independently by Marckwald and by Hahn. The probable existence of such a substance had been predicted for several years from the consideration of the relative rates of decay of radium and of uranium. It was evident that radium must be continually produced from uranium. Otherwise all existing radium must have disappeared long ago, since it requires at the highest estimate only 3,000 years for a given quantity to be reduced to one-half its original amount, and would practically disappear in about 100,000 years. Actually Boltwood found that there was a constant ratio between the amounts of radium and uranium in uranium ores. The known rate of decay of uranium was too great to account for the existing proportion of radium. Hence the probability of an intermediary substance. Ionium, which resembles thorium closely in its chemical reaction, doubles its radium content in less than six months, a rate of growth sufficient to account for the existing proportion of radium in uranium ores. From a more extended study of the rate of radium growth from ionium Boltwood determined the half value period of radium decay as about 2000 years. The same investigator considered that ionium was undoubtedly the direct parent of radium but it was possible that the so-called Uranium X was intermediary between uranium and ionium. It was assumed from its close relationship to thorium that the atomic weight of ionium was probably not far from 230. No method of separating ionium from thorium was devised.

Attempts to show that the activity of thorium may be due to other substances and not to pure thorium, by Hahn and McCoy independently, showed that thorium itself possessed activity, even when free from radiothorium, or mesothorium.

Dewar determined by direct measurement the rate of production of helium from radium, and obtained an increment of approximately 0.37 cubic millimeter of helium per gram of radium per day. This was only about one-eighth the value derived from Ramsay's work, but agreed remarkably well with Rutherford's calculation of 0.4 cu. mm. per day based upon purely theoretical assumptions two years ago.

The amount of helium present in the minerals of the earth's crust was determined by Strutt. He found that the amount depended upon the quantity of radio-active elements present, and was present in deposits of all geological ages, although it was not so plentiful in the younger deposits. In examining some of the Stassfurth salt deposits, he found that some of them, notably the potassium minerals sylvine and carnalite, contained remarkably large quantities, greater than can be accounted for by the small

quantities of uranium and radium present. He considered that potassium may possibly be the source of the helium in these minerals. See PHYSICS, section on *Radio-activity*.

ORGANIC CHEMISTRY. Fischer, Abderhalden, and their colleagues have made good progress during the year in their studies upon the synthesis of the polypeptides. These investigators are rapidly accumulating a large mass of data which seems likely before long to lead to a considerable advance toward the attainment of protein synthesis.

The chemical composition of chlorophyl, and the chemistry of plant physiology in general is a subject that has been long a favorite subject for speculation and research by organic chemists. An important contribution to this subject was made by Willstätter and Benz who have succeeded in isolating and analyzing crystals of chlorophyl. These were thought to be pure chlorophyl, now obtained for the first time, all products hitherto obtained being decomposition products. The crystals obtained were bluish green in color, have strong metallic lustre, and show brilliant reflections in sunlight. The most interesting and surprising feature was the fact that chlorophyl is a magnesium compound, containing 3.4% of magnesium. The molecule is very complex, the analysis agreeing closely with the composition $C_{55}H_{82}O_7N_4Mg$.

Esterification is a subject that received much attention. Among the many papers dealing with the subject that have appeared during the year 1908, may be mentioned those by Phelps and his colleagues, who studied quantitatively the preparation and purification of esters, and especially the influence of catalytic agents in ester formation. They found zinc chloride and hydrochloric acid to be a particularly efficient catalyst in forming esters of benzoic, succinic, malonic, and cyanacetic acids. In this connection these authors recommended the use of malonic and succinic acids and their anhydrides as easily prepared direct standards for alkalimetry and acidimetry.

The papers of Rosanoff and Prager were among the most important contributions to the subject of esterification. They took up the so-called esterification law of Victor Meyer, and their work so far seemed to show that this so-called law was really not such, but that "aromatic acids with one or both positions next to the carboxyl occupied by substituting groups, combine with alcohols more slowly, though to no less extent, than acids otherwise constituted." If this conclusion should be borne out by further work, the steric hindrance hypothesis will obviously have no basis for existence.

The reason for the color changes of indicators is still undecided. The dissociation hypothesis proved inadequate and was replaced by the quinoid rearrangement theory of Stieglitz. Acree, and also Stieglitz, considered that this theory was insufficient without amplification. They concluded that the color was not due primarily to the presence of a quinone group, but rather to intramolecular union of such a group with a salt of phenol, or with an aniline-like group. The red color of salts of phenolphthalein is thus due to the presence of salts of a dibasic acid containing such groups. This view of the constitution of phenolphthalein was corroborated by determination of the dissociation constant by Wegscheider.

A suggestive discussion of the probable nature of chemical affinity was published early in 1908 by Wilder D. Bancroft. While the nature of affinity will doubtless long remain a puzzle in science, the discoveries of recent years seem to indicate more and more clearly the electrical character of chemical forces.

Blackman invented a simple and apparently excellent method for determining the vapor densities of substances. A minute manometer made of capillary glass tubing and closed with a drop of mercury is introduced into an ordinary Carius tube of glass, and the temperature and position of the mercury in the capillary noted. The substance whose vapor density is to be determined is then introduced into the wide tube, the latter is sealed off and placed in a bath whose temperature is considerably higher than the boiling point of the substance to be examined. The new position of the mercury in the capillary reveals the pressure within the apparatus. Next the tube is cooled, opened, and filled with water, for the purpose of determining its volume. From the data thus obtained the vapor density of the given substance becomes known with a high degree of accuracy. A determination takes about three-quarters of an hour, and the method promised to be a real improvement on those generally used hitherto.

An interesting theoretical study of the laws of osmotic pressure was published by Lewis. The direct measurements of osmotic pressure carried out by Morse and Frazer showed that the simple laws deduced by van't Hoff require modification when applied to solutions of definite concentration. Lewis showed that by assuming that Raoult's law applies to solutions of all concentration, it was easy to calculate values for the osmotic pressure, which are in excellent agreement with the direct determinations of Morse and Frazer. Lewis further endeavored to explain the astonishing observation made by these experimenters, that the osmotic pressure of sugar solutions is the same at $0^\circ C.$ as at 25° . Meanwhile Prof. Morse and his collaborators carefully were refining and extending their direct measurements, and their painstaking efforts were resulting in a contribution of the highest value to physico-chemical science.

The principle of Soret, in accordance to which if one part of a given solution is heated and another part cooled, the substance dissolved will accumulate in the colder part until finally the concentrations have become inversely proportional to the absolute temperatures,—this principle was subjected to new experimental investigation by Oscar Scarpa at Naples. Contrary to Soret's own results, and to later experiments by Arrhenius, Scarpa found the mathematical theory of the phenomenon very closely borne out by facts when these are properly interpreted. It was doubtful, however, whether even these latest results may be considered as furnishing a final solution of the important problem of the Soret principle.

During the year Washburn succeeded in demonstrating experimentally, by highly precise measurements of the so-called "transfer numbers," the correctness of Jones's theory, according to which salts, or rather their electrically charged parts or "ions" in aqueous solution are chemically combined to a greater or less extent with the solvent. The theory in question must not be confused with the hydrate theory advanced a number of years ago by the late Prof.

Mendeléeff of St. Petersburg. Mendeléeff's theory had been repeatedly and severely criticised by the German School of Physical Chemistry and was generally taken to be false.

An important theoretical contribution was made by Stieglitz, of Chicago, who succeeded in showing that while Ostwald's dilution law, and even the empirical improvements on that law recommended by Rudolphi, van't Hoff, and Bancroft, fail to hold good for solutions of strong electrolytes, the principle of the constancy of the solubility-product holds with apparently perfect generality. The dilution law is important enough in its purely theoretical bearings. But it is the constancy of the solubility-product that forms the present theoretical basis of analytical chemistry, and therefore Stieglitz's contribution had very genuine practical value.

Morgan and Stevenson succeeded in highly improving the method of measuring the surface tension of liquids by the weight of falling drops, and showed how the molecular weights and critical temperatures of liquids can be determined with precision by this method. Their measurements constitute an experimental demonstration of the laws of Tate, viz., (1) that under given conditions, the weight of a drop is proportional to the surface tension of the liquid with respect to air saturated with its vapor; (2) that the weight of the falling drops of a liquid decreases with rising temperature. The most valuable part of Morgan and Stevenson's contribution lies in the high refinement of their experimental method.

Buttelli and Stefanini published a paper defending (against Sella) their view that two dilute solutions having the same vapor pressure, and therefore the same osmotic pressure, have the same surface tension. The subject is one of far reaching theoretical possibilities, and the principle just stated may also result in a new practical method for determining the molecular weights of substances in solution.

Wilhelm Engler succeeded in showing that, contrary to the widely accepted view, the changes going on in radio-active substances were more rapid at higher than at lower temperatures. Working in sealed vacuum tubes made of fused quartz and maintaining by electric means a temperature of about 1300°C., he found that radium produces its "emanation" and, in turn, the emanation decomposes much more rapidly than at ordinary temperatures. When the temperature was lowered, the original rate of change was re-established. Since radio-active changes are *par excellence* intra-atomic, Engler's interesting observation was direct proof, among other things, that a rise of temperature involved an increase of the kinetic energy, not only of the molecules, but also of the atoms of a substance.

The nature and properties of liquid crystals formed the subject of a considerable number of publications which appeared during 1908. Perhaps the most striking contribution was that made by Vorländer who succeeded in preparing crystalline liquids that were clear and absolutely transparent. These liquids were obtained by the condensation of anisaldehyde, ethoxy-benzaldehyde and phenyl-benzaldehyde, with alpha-constituted para-amino-cinnamic ethyl esters. The substances in question are viscous, but fail to show any turbidity even when examined with the ultra-microscope. When examined with convergent polarized light, a thin layer of one of these liq-

uids is found to behave like any double refracting crystal cut perpendicularly to its principal axis. In view of the fact that the existence of liquid crystals had long been doubted in many quarters owing to the peculiar appearance of those substances, closely resembling mechanical mixtures, or rather emulsions, Vorländer's find must be considered as an addition of great importance to our definite knowledge of one of the most curious phenomena in physical chemistry.

CHEMISTRY, INDUSTRIAL. A summary of the events of the year shows persistent effort in many directions towards improvement in details of processes, revealing a gratifying tendency to accord a greater recognition to the efforts of those chemists who have made industrial chemistry the vocation of their lives. This tendency readily explains the increase in the number of chemists in active practice as well as the increase in the literature of that science.

ORGANIZATIONS. In the United States the American Chemical Society (q. v.) continued its remarkable development under the presidency of Marston T. Bogert, and general meetings were held in New Haven, Conn., during June 30-July 2, and in Baltimore, Md., during Dec. 29, 1908.—Jan. 1, 1909. New sections of Eastern New York, with headquarters at Schenectady, and of Louisville, Ky., were established. Beginning with Jan., 1909, a monthly *Journal of Industrial and Engineering Chemistry* was to be distributed to its members. Its total membership in 1908 was about 4000. The Nichols medal was presented in 1908 to William H. Walker of the Massachusetts Institute of Technology for "conspicuous achievements in the field of industrial chemistry." The Society of Chemical Industry in Great Britain held its annual meeting at Newcastle in July and there chose Raphael Meldola for its president. This society issues a fortnightly journal. Its membership is about 5000 of which a third are residents of the United States. Its Perkin medal was presented in 1908 to J. B. F. Herreshoff of the General Chemical Company, New York.

METALS. The importance of calcium as a reducing agent, and hence its growing value in metallurgy led to a careful study of its properties which were described as follows: It is a silvery white metal that easily oxidizes in moist air; it is very light, with a specific gravity of 1.52, very malleable, and a good conductor of heat. It is as hard as aluminum; but at 400° C., it becomes as soft as lead. It is volatile and may be sublimed in a vacuum between 700° and 800°C.; at the latter temperature it melts. When alloyed with other metals its principal effects are to contribute hardness and so to produce crystallization, which naturally involves fragility. It hastens oxidation and disintegration under the influence of the air; increases decomposition of water, and aids the chemical activity. When used in refining metals, calcium acts in three ways: first, by reducing oxides and sulphides; second, by eliminating dissolved gases; and third, by forming compounds with certain impurities and thus rendering them less objectionable. In the case of copper in particular, the presence of calcium remedies the faults of the dry or sulphurous coppers and gives good castings.

A popular illustrated description of a recently installed plant at Nogent-sur-Marne in France for the manufacture of radium salts contained the following statements: The pitchblende resi-

dues obtained in the manufacture of uranium are first passed through crushers. The subsequent treatment is continued in wooden tanks and cast-iron tanks provided with stirring-devices. Each ton of residue will require five tons of chemicals and fifty tons of rinsing-water. The residues contain sulphates of practically all metals, and, as radium sulphate is the least soluble of all, this property is utilized to separate it from the remaining sulphates by washing it alternately with alkaline salts and water. As radium sulphate always remains at the bottom of the vessel, it is found there at the conclusion of the different operations (lasting about two and a half months), when one or two kilograms of impure radium bromide will be obtained from each ton of residue. The activity of this radium-holding salt hardly exceeds 50 to 60. Products of higher activity are obtained by submitting the mixture of salts to a series of successive crystallizations in pure water, and in water containing some hydrobromic acid. The difference of solubility of the bromide of radium and barium respectively is thus utilized, with a view of separating them from one another. After dissolving the various bromides, the solution is saturated at a boiling temperature, and beautiful crystals are obtained on cooling. These crystals possess an activity five times greater than the originally dissolved salts, and by repeating the operation, products of increasing activity are obtained. While the first fractional operations are still carried out on a commercial basis, the more minute operations required to treat the products of higher activity are necessarily performed in the laboratory by skilled chemists. At the end of this difficult treatment only one to two milligrams of bromide are found to remain from each ton of original residues, but this small amount shows an activity two million times higher than metallic uranium.

Announcement was made of the discovery of an alloy simulating the appearance of gold, and of unusual durability, which was described as consisting of 978 parts of copper, 2 parts of gold, and 20 parts of aluminum. The first step in its production is the melting of the copper and the gold in a crucible of fire-clay or other fire-proof materials. The mixture is kept in a molten condition about half an hour, after which 50 parts of borax are added as flux. The mass can then be poured out into bars. This alloy can be wrought into plate or wire, thus allowing of the manufacture of many varieties of jewelry and trinkets. It is said to be extremely ductile and malleable and when polished, very brilliant.

NITROGEN. Much interest continued to be manifested in the production of nitrogen. From a French source comes the following statement: The production of chemically pure nitrogen presents such difficulties that it has been considered practically impossible, at least on a commercial scale. Even using liquid air, the gas obtained is not perfectly pure. By lowering the temperature so far that the nitrogen of the air is not only liquefied, but solidified, it has now been found that it may be removed in a chemically pure state. By taking advantage of the fact that oxygen and nitrogen, the two principal constituents of air, liquefy at -182° and -195°C , these gases may be obtained in separate form and practically pure. Below -195° and at atmospheric pressure these two constituents form a transparent liquid slightly tinted with blue, the

color of liquid oxygen. As the temperature of this liquid rises, the nitrogen, which is the more volatile, vaporizes first, and when the temperature is intermediate between -195° and -182° , almost nothing is left but the liquid oxygen. The phenomenon is somewhat complex; the oxygen evaporates also, even below -182° , but less rapidly than the nitrogen. The combination of atmospheric nitrogen in the manufacture of artificial fertilizers had not been altogether successful up to the close of the year. The chief expense of the process was the cost of the power. Moreover, unless the oxides of nitrogen produced in the arc are immediately removed from it, they will be decomposed. In those processes which were promising the best results this effect was being overcome by drawing the treated air rapidly away from the arc. In the Birkeland and Eyde process, which seemed to be the only one of this class in operation, in addition to keeping the air flowing constantly through the furnace, an alternating-current arc was employed, which, by means of a magnetic field was blown rapidly across the stream of air, thus acting but a short time on any portion of it. The efficiency of this process was said to be higher than that of the other processes which have been tried, and the system was in operation in Norway, where cheap power is available.

Another process, which is conducted on a commercial scale in Italy, was also electrical, but the energy was used simply as a heating agent. The process depended on the reaction which takes place when calcium carbide was heated and brought into contact with nitrogen. One atom of carbon is given up, its place being taken by two atoms of nitrogen, resulting in the compound known as calcium cyanamide. A modified process credited to J. B. C. Kershaw was as follows: A further improvement would be a method that would lower the temperature at which the reaction takes place. It has been found that calcium chloride and calcium fluoride have this effect. They are unchanged by the reaction and remain in the product as adulterants, and this may be objectionable or not according to their properties. Nitrogen is used to fill thermometers, to inflate pneumatic tires, where it takes the place of ordinary air with advantage, and in the manufacture of nitrates and of calcium cyanamide, and apart from the uses of the laboratory, nearly pure nitrogen is good enough for these purposes. The French chemists Muntz and Lainé studied the possibilities of obtaining nitrogen from peat. They reported that from a peat bog of 2,500 acres with an average depth of $6\frac{1}{2}$ feet and an average of nitrogen content of two per cent. it was possible to produce 800,000 tons of sodium nitrate. Therefore the possible exhaustion of the Chile nitrate beds could be disregarded. A large quantity of combined nitrogen is lost in distillery wastes and methods for the recovery of this nitrogen in the form of ammonia have been presented but thus far they have proved impracticable.

PAPER. The possible exhaustion of the timber supply of the world, due largely to the use of wood pulp in the manufacture of paper, has led to the search for other crude materials from which paper could be made. For two years prior to 1908 chemists in the United States Forestry Bureau have been experimenting and they claimed that pulp which had hitherto only been made from wood could be made and manufactured

from ordinary cornstalks. The process of making the pulp is simple. It was found that the "soda cooked" process, which was the best for making finer grades of wood-pulp, paper yielded the most satisfactory results; moreover the cornstalks only need about two and a half hours of cooking by this process against the thirteen or fourteen hours required to soften the wood pulp. Several varieties of paper were produced. One grade was dark gray, thick and heavy like parchment and almost as tough as sheepskin. Then there was a lighter shade of the same character, two shades of yellow, and one of white. The white paper was made from the hard outside shell of the stalk and the yellow grades had a much longer fibre, and resembled paper made from linen rags or cotton. They were very soft and pliable. Many tons of cornstalks are available for this new manufacture; for at present the stalks are annually destroyed so as to get them out of the way, or else they are simply turned under the soil with a plow to add slightly to the fertilization. It was said that the new product will be one half cheaper than the print paper made from wood pulp.

ARTIFICIAL GEMS. The artificial production of diamonds by heating in an electric furnace to 4,000° C. a mixture of ferro-boron and charcoal was announced by M. Lemoine, and for this process he secured \$32,000 in London. This remarkable statement was discredited by Lemoine's disappearance from Paris in June, 1908, when the matter came before the courts. In the trial it was said that the De Beers Diamond Co. of South Africa had been approached for the purpose of inducing it to pay \$25,000,000 for the secret. In June also came the announcement that Miethe of Charlottenburg, Germany, had devised an entirely successful and practical method of making artificial sapphires, rubies, and emeralds and of any desired shape or size. It was claimed that these artificial gems can be made very cheaply.

MISCELLANEOUS. Improvements in the manufacture of artificial silk continued to be reported. Its use for gas mantles was recommended as such mantles are found to possess greater strength than the ordinary cotton tissues now used. Spun glass was finding new uses and clothing made of it was advocated as being incombustible, non-conducting, and resistant to acids, as well as perfectly insulating to electricity. Studies on the fading of colors showed that absolute fast dyes cannot be obtained and that all that can be done is to select the most resistant pigment, and to keep the fabrics under such conditions as to minimize the atmospheric influence. Through the use of a weak solution of potassium hydroxide it is claimed that the bodies and features of mummies may be restored so completely that the color of the skin, the contours of the features, and even diseases of the skin may be readily detected. A material resembling leather was described as being made from the fibre of a variety of cactus, common in the western desert lands of the United States. A process for retanning leather was patented, which it was claimed not only makes the leather flexible but added to its strength, elasticity, and wearing qualities, and also rendered it permanently waterproof. A new substitute for leather was reported from Scotland, which is composed of sea weed, carpet dust, Irish moss, and gums, combined by a secret process. This new product was made up into boots and shoes, which successfully stood the tests applied

to them. A new kind of damp-proof wall covering, made of "raw copper" and varying in thickness from 0.0012 of an inch to 0.006, which is both insect-proof and damp-proof, was described as being successfully used in Calcutta. Studies on the preservation of timber made under the direction of the United States Department of Agriculture, corroborated the value of using antiseptics for the preservation of wood. The best results were obtained from treatment by chemicals that kill the fungi on the wood or destroy the food value of the wood for them. A shell filled with a non-explosive sleep-inducing drug was an invention of Carl M. Wheaton that received the approval of certain scientists and naval authorities. Blau gas is common illuminating gas liquefied and delivered in ordinary cylinders. It came from Germany and caused some interest owing to its portable nature. Cutting iron with oxygen was found to accomplish the desired result in much shorter time than by the ordinary method.

CHESS. The world's championship in 1908 was contested for by E. Lasker and S. Tarrasch at Düsseldorf and Munich, the match lasting from August 17 to Sept. 30. Lasker repeated his successes of former years winning 8, drawing 5, and losing 3. The Anglo-American Cable match for the Newnes trophy was held on March 13 and 14, the American team winning by a score of 6½ to 3½. In the inter-collegiate cable match for the Rice trophy the Americans were also successful, with 3½ games won and 2½ games lost. The Düsseldorf Tournament, Aug. 3-17, was won by F. J. Marshall of Brooklyn, N. Y., and the Lodz (Russia) Tournament, Sept. 20-Oct. 15, was won by A. Rubinstein, with F. J. Marshall second. In the Vienna Masters' Tournament, Mar. 23-Apr. 17, O. Duras, G. Marcozy, and C. Schlechtes were tied for first place. In January, Janowski defeated Marshall at Paris, winning 5, losing 2 and drawing 3. The Sixteenth Intercollegiate Tournament was again won by Columbia, with 9½ games won and 2½ lost. Yale was second with a total of 6½ to 5½. In the Ninth Triangular College Chess League Tournament, Cornell was the victor, with a score of 5½ to 2½. Pennsylvania was second, winning 4 and losing 4. H. E. Bird of England and M. I. Tschigorin of Russia, two well known players, died during the year.

CHICAGO. See ILLINOIS.

CHICAGO, UNIVERSITY OF. An institution of higher learning at Chicago, Ill., founded in 1891 by John D. Rockefeller. The total attendance, including the summer quarter, in 1907-8 was 5038. In the autumn of 1908 it was 2371; 2527 of these students were in attendance only at the twelve weeks summer session, one of the regular quarters of the University year. Of the remainder, 1452 students were in arts; 381 in graduate schools; 183 in law; 180 in education; 172 in theology; and 141 in medicine. In addition to the departments listed, the University conducts evening and Saturday courses, non-resident lecture courses and correspondence study. It conducts also an academy for boys and has close affiliation with 13 other college institutions, academies and seminaries, and official coöperation with some 200 high schools in 18 States. The University Press has published 375 volumes and issues fourteen periodicals. The library contains 473,175 volumes. A fund of \$8,000,000 for a library building in

memory of Dr. Harper has practically been raised. The equipment of the University is valued at \$9,000,000; its endowment, \$17,000,000; its annual income, \$1,250,000. The President is Harry Pratt Judson.

CHILD LABOR. The agitation against the employment of children in mills, factories and stores, which was so pronounced in 1907 as to attract universal attention, continued during 1908 with unabated earnestness and success. An aggressive campaign of agitation and education was carried forward by the national and State child labor committees, with whom consumers' leagues coöperated. The fundamental principles on which this movement rests were brought out in addresses at the fourth annual meeting of the National Child Labor Committee at Atlanta, Georgia, Apr. 2-5, 1908. The chairman of this Committee, Dr. Felix Adler, found the basis of the agitation in the inconsistency of child labor with Americanism, that is, with the spirit of fair play, the feeling that it is unjust for adults to place heavy burdens on the weak shoulders of a child. Dr. Edward T. Devine emphasized the growing demand that the child be insured certain rights both for his own welfare and for benefit of the future citizenship of the State. Among these rights he included the right to normal birth, the right to grow up with full physical vigor, the right to be happy, the right to a useful education, and the right to such equipment and opportunity as shall enable him to progress beyond the achievements of his parents. Other addresses at this meeting emphasized the necessity of compulsory school education as preliminary to, and coördinate with, the regulation of child labor. Another point discussed was the connection between immigration and child labor.

The Southern States were the scene of most active agitation during 1908. North Carolina, South Carolina, Florida, Tennessee, Arkansas and Alabama had enacted new laws in 1907. The movement was greatly stimulated by the Nashville Child Labor Conference in October, 1907, at which the entire South was represented. It was also furthered by the Atlanta meeting in April, 1908, already mentioned. New laws were passed in 1908 by Kentucky, Louisiana, Mississippi, and Virginia. The Kentucky law prohibits the employment of children under fourteen during school terms, and restricts their employment at other times to farm and domestic work. It also limits the employment of those between fourteen and sixteen years of age to occupations not dangerous to health, morals, life or limb. The law also requires sanitary conditions and protection against dangerous machinery. The Louisiana law, brought about largely through the efforts of Miss Jean M. Gordon, Factory Inspector for New Orleans, is considered one of the best laws yet enacted by any State. It passed by the narrow margin of one vote in each house of the Legislature. It raised the age limit for boys from twelve to fourteen: fixed fourteen as the minimum age for both boys and girls in any mill, factory, mine, packing house, workshop, laundry, mercantile establishment and messenger service. Age certificates must be obtained from the factory inspector. The legal working day in the above industries is limited to ten hours for all women and girls and for boys under eighteen. Night work is prohibited for boys under sixteen and for girls under eighteen. Provisions for sanitation and safety were also included. In

Mississippi a child labor committee was organized late in 1907. Investigation showed that approximately one-fourth of the mill operatives were under fourteen and that one-half were illiterate. A law was then pushed through the legislature, though the highest legal limit as to age that could be secured was twelve years. Children under sixteen may not be employed in a mill or factory more than ten hours per day. County sheriffs and health officers were given the duties of factory inspection. Moreover the law was limited in its application to textile mills and those where children are employed indoors at work injurious to health or in operating dangerous machinery. The Virginia committee on child labor, organized in the fall of 1907, secured the passage of a compromise measure. It raises the age limit from twelve to thirteen after Mar. 1, 1909, and to fourteen after Mar. 1, 1910. The law does not apply to orphans or children with dependent relatives. A section arousing bitter opposition on the part of cotton mill and tobacco factory interests, was the provision that employment of children under legal age shall be *prima facie* evidence of guilt on the part of both employer and parents. At the same time the Virginia Legislature passed a compulsory education law. There was activity on the part of friends of the movement in every other Southern State. In some, efforts were made to secure new laws in 1908, and in others local child labor committees were being formed and investigations begun with a view to a legislative campaign in 1909.

In practically all of these States, more efficient factory inspection and law enforcement is a necessity. An excellent law passed by the Oklahoma Legislature was vetoed by Governor Haskell. Other States enacting laws in 1908 were Ohio, New York and New Jersey. The Ohio law prohibits the employment of children under fourteen; permits the employment of children of ages fourteen to sixteen provided they have schooling certificates; limits the hours of boys under sixteen and girls under eighteen to forty-eight hours per week and eight hours per day and restricts these hours to those between 7 A. M. and 6 P. M.; specifies a long list of occupations considered dangerous to life, limb, health, or morals in which children under sixteen may not be employed; forbids the employment of girls under sixteen in any capacity requiring them to stand continuously, or in any branch of the tobacco industry; and provides for the appointment of eight women factory inspectors.

In New York a considerable victory for the protection of child labor was won by the passage in June of the Page-Parker bill, regulating the employment of children in mercantile establishments. It was most vigorously opposed by the managers of some department stores, and closes a struggle lasting a dozen years between such managers and a group of social reformers. By this law the inspection of mercantile establishments is taken from local boards of health and placed in the hands of the State Labor Department, in which a bureau of mercantile inspection is created. By this law, New York takes its place alongside of Illinois, Massachusetts, and Oregon in the protection of women and children employed in retail stores. On Dec. 13 Commissioner John Williams of the New York Labor Department, issued a public statement in which he complained of the difficulty of securing conviction in cases for alleged violation of the

laws regarding the employment of women and children. Although tried before juries, and although in some cases evidence of violation was undisputed, thirty-two cases brought in September, October and November, 1908, resulted in not one conviction. Such difficulty has not been limited to New York by any means. The New Jersey law consists in a compulsory school attendance law raising the legal age of employment during the school period to fifteen years. The New Jersey law consists in a compulsory school attendance law raising the legal age of employment during the school period to fifteen years.

The vigorous but unsuccessful efforts made in 1907 in behalf of a national child labor law was converted in 1908 into an effort for a law applicable to the District of Columbia. Such a law passed May 28, 1908. It had been contended that no child labor existed in the District, but by Nov. 1 fully 8000 applications for permits under the new law had been made, 3500 of which were rejected on account of age or education. Other activities of the National Child Labor Committee consisted in the continuation of the effort to secure a national children's bureau at Washington to investigate and report on all matters pertaining to children and child life, and in the designation of the fourth Sunday in January as Child Labor Day.

Another feature of the child labor movement is the establishment of scholarships to provide for poor children thrown out of work by the new laws. These prevent numbers of such children from becoming public charges, enable them to go to school and prevent the suffering that would otherwise result from the reduction of family incomes. By the close of 1908 such scholarships had been founded in Chicago, New York, Philadelphia, Pittsburgh, St. Louis, Baltimore, Grand Rapids, Toledo, Los Angeles, Louisville, and Mt. Vernon, N. Y. The scholarship system is considered only temporary, being required as an assistance in the readjustment necessitated by progressive legislation.

In Canada several changes were made in the provincial laws. In Ontario the Factories Act was amended by limiting the working day for boys under sixteen to ten hours, forbidding the employment of children under twelve within doors and restricting the privileges extended to canning factories. The Shops Act was amended by raising the age limit from ten to twelve years. Manitoba forbade the employment of minors as bartenders. Alberta raised the age limit of children employed in mines from twelve to sixteen. British Columbia prohibited the employment of boys under fourteen and girls under fifteen, except in the canning of fish. See *The Annals of the American Academy of Political and Social Science* for May and July.

CHILDREN'S COURTS. See JUVENILE COURTS; JUVENILE DELINQUENTS; and PENALOGY.

CHILE, OR CHILI. A republic of South America, occupying the western coast of the continent from the river Samu, 17° 57' S. lat., to Cape Horn. It consists of 23 provinces and one territory. Area, about 292,400 square miles. Population, in Nov., 1907, 3,249,960, against 3,399,928 in 1905. The principal cities, with their population in 1907, are Santiago, the capital, 378,711; Valparaiso, 197,596; Concepción, 55,554; Iquique, 38,269; Talca, 38,000; Antofa-

gasta, 32,219; Chillan, 30,684. The government has been making efforts to secure immigrants, particularly from southern Europe and Japan. The number of immigrants has accordingly increased from 293 in 1905 and 1442 in 1906 to 8810 in 1907.

EDUCATION. Elementary education is free, but not compulsory. About 70 per cent. of the adult males are illiterate. In 1905 there were 2099 public primary schools, with 159,379 registered pupils, an average attendance of 102,925, and 4484 teachers. Private primary schools numbered 521, with 31,327 pupils. For secondary education there were 39 lyceums for boys, with 10,179 students; 23 lyceums for girls, with 3686 students; and 8 normal schools, with 727 students, besides one belonging to the Archbishopric, with 80 students. There are several schools for technical instruction, including schools of agriculture, mining, mechanics, electricity, design, etc. The *Sociedad de Fomento Fabril* maintains 17 industrial schools, with 3195 pupils. Higher education is provided in the National University, with about 1200 students, the Catholic University, and the National Institute of Santiago.

AGRICULTURE AND FORESTRY. The area and yield of the chief crops in 1905 were: Wheat, 365,000 hectares and 3,308,614 quintals (1907: 15,776,000 bushels); barley, 73,338 hectares and 809,288 quintals (1906: 978,664 quintals); maize, 21,112 hectares and 214,897 quintals (1906: 846,000 bushels); beans, 21,964 hectares and 243,367 quintals; potatoes, 27,278 hectares and 845,998 quintals. In 1906 vines covered 57,665 hectares, including 17,260 hectares under irrigation, these latter yielding the best grapes. The yield of wine in 1907 was about 55,000,000 gallons. Experiments in flax growing in southern Chile have proven successful, and in Feb., 1908, a bounty on flax-growing for a period of 12 years was decreed. In 1906 there were in the country 2,674,666 cattle; 746,150 horses, asses, and mules; 4,528,109 sheep; 436,739 goats; and 338,993 hogs. The Territory of Magellan owes its prosperity mainly to sheep breeding. In 1907 it was estimated to have 1,873,709 sheep, 37,804 horned cattle, 23,888 horses, 827 hogs, 122 mules, and 33 goats. The export of common wool in 1907 was 2,112,275 kilos, and of hides, 1,022,340 kilos. Chile is the only country of South America with a large area of forests suitable for the production of wood pulp. In a special message to Congress in 1908, the President called attention to the wasteful methods employed in exploiting the southern forests of the country, and recommended legislation to govern the cutting of timber, the burning of underbrush, and the clearing of commercial lands.

MINING. The chief mining products are nitrate, copper, coal, gold, silver, manganese, iodine, and borate. The production of nitrate in the year ending Mar. 31, 1908, was 2,058,920 tons, against 2,007,076 tons in 1906-7, and its exportation in 1907-8 amounted to 1,978,500 tons, against 1,892,115 in 1906-7. The production for the year 1908-9 was fixed by the Chilean Nitrate Association at 39,500,000 Spanish quintals (of 101.41 pounds each), or over 2,000,000 tons. In 1908 it was reported that a syndicate composed of J. P. Morgan & Co., Baring Bros., and the Anglo-South American Bank had acquired control of a large nitrate field, several nitrate factories, the railway running from

Aguas Blancas to the port of Coloso, and the port itself, which is private property. The production of the property in 1907 was reported to have been 3,500,000 Spanish quintals. The price paid for it was \$12,500,000. This was said to be the first entrance of American capital into the nitrate industry. The exports of iodine in 1907 were 289,236 kilos. The coal now mined in Chile is for the most part lignite, but extensive deposits of good coking coal have been discovered in the interior of the province of Arauco. The consumption of coal in 1907 amounted to 832,612 tons domestic and 1,489,154 tons imported coal, against 51,097 tons and 797,634 tons respectively in 1903. The production of copper in 1907 was 27,112 metric tons. The salt deposits are said to be the greatest in the world. Placer mining is an important industry in the Territory of Magellan. In 1907 the export of gold ores was 18,960 kilos; silver ores, 219,918 kilos. In 1907 the government paid a bounty of 50,195 pesos on the production of 1,673,159 kilos of sulphuric acid (about 1.1 cent per kilo). A native company capitalized at \$500,000 has put an extensive cement plant in operation at Calera, a few miles from Valparaiso, where large deposits of the requisite materials are found. The annual capacity of the plant is about 100,000 barrels. Natural gas and petroleum have been discovered in the township of Carelmapu, province of Llanquihue, about 500 miles south of Valparaiso, in the vicinity of a gold mining district, and not very far from the steel works now being erected at Corral.

MANUFACTURES include the preparation of foods and beverages, textiles, clothing, leather, vehicles, and pottery, in addition to the chemical and metallurgical industries connected with mining. In 1905 there were 10,152 industrial establishments. The department of Santiago contained in 1906, 1051 industrial establishments, with at least four employees each, having an invested capital of 54,476,422 pesos, using up annually raw materials to the value of 38,605,000 pesos, and having an annual production of 83,409,000 pesos. There are 22 modern, well-equipped shoe factories. In the Territory of Magellan there are, in connection with the sheep raising industry, two large refrigerating plants, one of which shipped 120,000 frozen sheep in 1907, besides tallow, soap, stearin, and salted meat factories. Shipbuilding is a new industry. In 1907 the shipyards at Valdivia built six small steamers and fifty launches.

FOREIGN COMMERCE. In 1907 the total imports amounted to 293,681,855 pesos (of 36.5 cents each), against 236,040,991 pesos in 1906, and the total exports, 280,080,730 pesos, against 289,513,522 pesos in 1906. The decline in exports is entirely due to the decline in value of the nitrate export. The leading imports in 1907 were, in pesos: Coal, 29,783,080; cotton goods, 36,334,739; woolen goods, 18,720,686; industrial oils, fuel, etc., 40,876,550; iron and steel goods, 35,060,364; industrial machinery, 18,440,997; mining tools and machinery, 10,003,267; rolling stock for railways, 11,268,931; vegetable products, including wheat, flour, rice, sugar, coffee, tea, etc., 30,339,127; animals and animal substances, including cattle, fish, leather, tallow, etc., 21,302,447. The leading exports in 1907 were, in pesos: Nitrate, 206,202,950 (1906: 217,317,015); copper, ingots, and ores, 25,949,000; iodine, 4,202,000; borate of lime, 3,961,000;

415. The trade with the principal countries of origin and destination in 1907 was as follows, in pesos:

From and to	Imports.	Exports.
Great Britain	113,502,732	139,666,884
Germany	74,310,374	55,819,019
United States	31,124,384	24,843,462
France	16,093,564	16,224,086
Belgium	10,197,301	3,724,218
Argentina	10,015,251	2,746,681
Peru	8,795,298	2,820,653

leather, 2,547,000; fruits, grains, etc., 11,851,111. NAVIGATION AND SHIPPING. In 1907 the ports of Chile were entered by 13,971 vessels of 24,646,751 tons, and cleared by 13,952 vessels of 24,159,898 tons. The Chilean merchant marine (100 tons and over) consisted in 1907 of 87 steamers, of 66,020 net tons, and 63 sailing vessels, of 48,589 tons.

INTERNAL COMMUNICATIONS. In 1907 there were 3289 miles of railway, of which the government owned 1543 miles and private companies 1746 miles. In June, 1908, the government lines had 587 miles under construction. The Longitudinal Railway is designed to connect the country from north to south, from the town of Arica (18°1' S. lat.) to Puerto Montt (44°29' S. lat.). It is divided in three sections: From Arica to Ligua (18°1'—33°), 1331 miles; from Ligua to Victoria (33°—38°16'), 402 miles; and from Victoria to Puerto Montt (38°16'—44°29'), 345 miles. Of the first section, 388 miles have been completed; the second has been entirely completed; of the third 283 miles have been completed. The railway from Arica to La Paz, Bolivia, was under construction; this is to form a link in the Pan-American Railway. The cross-continental line between Valparaiso and Buenos Ayres is broken by only a four hours' stage ride. Part of the trans-Andine line between Los Andes, Chile, and Mendoza, Argentina, was open for traffic. The length of telegraph lines in 1905 was 11,837 miles.

BANKS AND MONEY. There is no national bank. The condition of the 24 banks in the country on Dec. 31, 1907, was as follows, in pesos: Paid-up capital, 124,040,526; reserve and guaranty funds, 25,765,953; deposits, 415,205,924; cash on hand, 88,745,808; bonds, securities, real estate, and other property, 25,596,021; advances, 478,548,847; total assets and liabilities, 811,363,263. The most important of these banks is the Bank of Chile, with a subscribed capital of 30,000,000 pesos and cash on hand amounting to 39,664,406 pesos. On June 30, 1908, the savings banks had 198,419 depositors, with 22,876,142 pesos of deposits. The gold peso is worth 36.5 cents. The money in circulation consists mostly of paper, of which about 150,000,000 pesos are in existence. The paper peso fluctuates in value. On Dec. 10, 1907, gold was quoted at a premium of 125 per cent., against 46 per cent. on Sept. 1, 1907, and 30 per cent. on June 30, 1906. The paper money is to be gradually exchanged for new legal tender currency at full value, and to this end the government is accumulating gold. On June 30, 1907, the accumulation of gold amounted to £5,881,512—the equivalent of 78,420,160 gold pesos. In addition to this, the President was also authorized by Congress to contract a foreign loan of £4,500,000 to guarantee the currency.

COMMERCIAL CRISIS. Towards the end of 1907 a severe commercial crisis set in, due mainly to the following factors: The economic situation in Europe and the United States and the consequent pressure on Chilean customers for the immediate payment of debts; the fall in the price of copper, which led to the closing of 40 per cent. of the copper mines; the reaction after the boom of 1904 and 1905, when numerous companies were floated in agricultural, mining, nitrate, and other enterprises, many of which had gotten into difficulties and whose shareholders were anxious to dispose of their holdings; and the necessity of meeting the obligations incurred to repair the damages of the earthquake of Aug., 1906. As was shown above, there resulted a great depression of the paper peso, and by Dec., 1907, two banks were closed. Many importing orders were cancelled. The redeeming features of the situation were the prospects for good crops and the prosperous condition of the nitrate business.

FINANCE. The accepted budget for 1908 estimated the revenues at 224,000,000 pesos paper, to be derived mainly from export duties on nitrate, import duties, the alcohol tax, the railways, and post office. The expenditures were estimated at 65,230,892 pesos gold and 157,715,666 pesos paper. These include 5,795,000 pesos gold and 33,221,083 pesos paper for the Ministry of the Interior; 140,333 and 21,847,716 respectively for Public Instruction; 18,656,146 and 14,332,237 respectively for Finance; 1,682,020 and 20,952,477 respectively for War; 9,324,269 and 11,620,797 for Navy; and 28,571,327 and 42,310,960 respectively for Industry and Public Works. The external debt stood on Dec. 31, 1906, at 280,634,400 gold pesos; the internal debt at 6,399,700 gold and 147,480,965 paper pesos.

ARMY AND NAVY. The army consists of a militia in which all able-bodied citizens between eighteen and forty-five years of age are liable to service. The recruits are generally called in at the age of twenty-one years and serve six months with the colors; this is followed by nine years in the first reserve, and then in the second reserve until the age of forty-five is reached. The second reserve is organized as a territorial army. The annual contingent is about 6200; the permanent peace army consists of 849 officers and 4757 enlisted; and the war strength, including the reserve, is about 95,000 of all grades. The effective navy consisted, at the beginning of 1908, of 1 battleship of the third class, 7000 tons; 2 armored cruisers, 15,700 tons; 4 protected small cruisers, 14,500 tons; 9 destroyers, 4000 tons; 5 torpedo boats, 650 tons; total, 21 ships of 41,850 tons. The personnel of the navy consists of about 4600 officers and men. The coast artillery corps numbers about 1200 officers and men.

The President in 1908 was Pedro Montt, whose term is Sept. 18, 1906-1911.

HISTORY. Congress was opened on June 1, 1908. The year, in the main, was marked by the existence of friendly relations with the other South American republics, and although questions between Chile and Peru, relating to the retention by the former of the provinces of Tacna and Arica, were still pending in 1908, it was expected that they would soon be amicably adjusted. A commercial treaty between Chile and Argentina was under consideration during the year. On Sept. 2 the premier read the gov-

ernment's programme to the Congress. The government, he said, was chiefly occupied in carrying out reforms tending to the development of the country's economic resources and in restoring a sound currency system. At the same time it would aim at improving the condition of the working people and at removing the causes of dispute with employers. A treaty of navigation and commerce with Ecuador was signed in September. It provides that various Ecuadorian products, including sugar, coffee, and cacao are to be admitted to Chile free of duty, and the same privilege is to be accorded by Ecuador to Chilean saltpetre, guano, cereals, and wood. The two governments also agreed to make arrangements for subsidizing a steamer service between Chile and Ecuador. According to the budget estimates for 1909, which amounted to \$75,000,000, there was a reduction of \$5,000,000 from the previous year. The American battleship fleet in its voyage around the world entered the harbor of Valparaiso on Feb. 4 to salute the official representatives of Chile, and departed without dropping anchor. The American torpedo division was piloted by Chilean warships along the inner route from the Straits of Magellan to the harbors near the Peruvian frontier.

CHIMNEYS. The tallest chimney in the world was completed during the year 1908 at the plant of the Boston and Montana Copper and Silver Mining Company, of Great Falls, Montana. It exceeded by 40 ft. the next highest chimney in the world and by 140 ft. the next highest in America. It is 506 ft. high, has a foundation 74 ft. in diameter, an interior top diameter of 50 ft., an exterior top diameter of 54 ft., and was so designed that 60 ft. additional may be added if desired. The barrel of the chimney has a circular ring section, but the lower 46 ft. which forms the base is octagonal in exterior outline. The chimney has four separate batters, the upper 180 ft. having 1 per cent., the next 100 ft. 2 per cent., the next 180 ft. 3½ per cent., and the octagonal base 4 per cent. A heat protecting lining, 4 in. thick, extends from top to bottom. The cost was about \$200,000.

CHINA. An empire occupying the greater part of eastern Asia. Its area is estimated at 4,376,400 square miles. Estimates of its population vary from 330,130,000 to 438,214,000, the latter being the estimate of the customs authorities in 1906. The empire consists of China proper, with an area of about 1,532,000 square miles and a population estimated at from 320,500,000 to 407,253,000; and the dependencies of Manchuria (q. v.), 363,000 square miles, and from 5,500,000 to 16,000,000 inhabitants; Mongolia, from 1,076,000 to 1,368,000 square miles and from 1,850,000 to 2,600,000 inhabitants; Tibet (q. v.), from 463,000 to 814,000 square miles, and from 2,350,000 to 6,500,000 inhabitants; and Chinese Turkestan, Kulja, Zungaria, and outer Kan-su, all comprised in the province of Hsin-Ching, lying between Mongolia on the north and Tibet on the south, with from 530,000 to 1,890,000 square miles, and from 1,200,000 to 4,100,000 inhabitants. For the various cessions and leases of Chinese coast territory to other powers, see under their respective titles.

Chinese official investigation places the number of Chinese in foreign countries at 6,800,000, mostly in Siam, Java, Malaysia, and neighboring

countries. There was in 1908 a wave of Chinese emigration to outlying regions of the empire, particularly northern Manchuria and Mongolia. In the latter country the native nomadic tribes were in some cases settling in villages and becoming farmers in order to be saved from extinction. The number of foreigners living in China in 1907 was estimated at 69,852, distributed among 2,595 firms and including 2,862 Americans, 9,205 British, 2,201 French, 3,553 Germans, 45,610 Japanese, 3,188 Portuguese, 479 Russians, etc. The population of Peking, the capital, is estimated at from 500,000 to 1,650,000; a census taken in 1908 gives 128,008 families, which would give, on the basis of 5.5 persons to the family, 693,044 inhabitants. Siangtan and Signan, inland cities, are reported to have 1,000,000 inhabitants each. The more populous treaty ports are: Tientsin, 800,000; Newchwang, 74,000; Chungking, 705,000; Changsha, 230,000; Chefoo, 100,000; Hankow, 778,000; Wuhu, 122,000; Nanking, 270,000; Chinkiang, 181,000; Shanghai, 651,000; Soochow, 500,000; Hangchow, 350,000; Ningpo, 260,000; Foochow, 624,000; Canton, 900,000; Amoy, 114,000; Chancha, 230,000.

EDUCATION. The old system of education, confined to Chinese classics, was swept away by the Imperial Decree of Sept. 3, 1905, abolishing the old system of examination as a condition of obtaining state employment. Numerous schools and colleges for young men and women have been started in the large towns, a large number of students have been sent abroad, particularly to Japan; and the primary schools, which were neglected at first, are now receiving more attention. At Peking there is an Imperial university, a government institution, where Western science and languages are taught by European and Japanese professors, and Chinese subjects by Chinese. In 1908 the government decided to establish at Peking a university of the first rank, consisting of eight colleges, viz., foreign languages, Chinese literature, science, commerce, law, medicine, agriculture, and engineering. To meet initial expenses, 2,000,000 taels (about \$1,400,000) were assigned, and large tracts of land purchased for buildings. The Union Medical College at Peking was opened in 1906, the funds being raised by public subscription. In 1908 there were in Peking 183 schools for boys and 17 for girls, with 1,200 male and 100 female teachers, and 17,053 pupils (771 girls). This is the result of two years' work. Tientsin has a Chinese university, with European and Chinese professors, an Anglo-Chinese college, an industrial school with Japanese instructors, and a medical college. Canton has a college of foreign languages, an agricultural school, a law school, etc. Nanking has a military and a naval college, as well as government middle schools and a normal school, equipped with laboratories and natural history collections; work has begun on new buildings for the military college, which are to accommodate 8000 students for a three years' course. Military schools have also been established in connection with the arsenals at Tientsin, Shanghai, Foochow, Canton, and other cities. Colleges have been founded in 15 provincial capitals. Buddhist temples are being converted into school-houses. Arrangements have been made by the management of the Imperial Railways of North China, in conjunction with the Chinese Engineering and Mining Company, for opening an

engineering and mining college at Tong-shan for 140 students. Mission schools exist in all the large treaty ports and in several inland cities. In 1908 the German consul at Canton, acting upon instructions from his government, applied to the taotai for permission to open in the city a school for teaching the German language to Chinese students.

AGRICULTURE. The land holdings are generally small, and are owned in freehold by families. No land can be sold until all the near kindred have refused to purchase. The rainfall is inadequate, especially in the north, and irrigation is resorted to on a large scale. The principal crops of the north are wheat, barley, maize, millet, and other cereals, beans, and peas; in the south, rice, sugar, indigo, and cotton. Tea is cultivated in the west and south, and silk in every province. For details of the tea and silk trade see under *Commerce*. About one-fourth of the world's supply of raw silk comes from the Chinese Empire. Under the decrees of 1906 the production of opium has been greatly restricted and will cease in ten years. In some portions the cultivation has been entirely suppressed, violators of the prohibition being liable to the confiscation of their land. In 1907 the production of native opium amounted to 6,424,964 pounds. Camphor is produced in the province of Fukien, opposite Formosa, and is now a government monopoly. A large part of the cotton product is consumed in the homes of the immediate producers. The quantity entering commercial channels, either for export or for consumption in local mills, was estimated for 1907 at 428,000 bales of 500 pounds each. The cotton is of very short staple. In 1906 there was a general scarcity, amounting to famine over large areas. High prices of food prevailed in every part of the empire and resulted in many of the local risings which marked the year 1907. The various crops of 1907, with few exceptions, were fair or excellent in almost all the provinces; but the full benefit of the good harvest could only be felt as the year drew to a close. The Yangtse valley, as a rule a contributor to the necessities of distant provinces, was for the greater part of the year dependent on supplies from other districts, and the scarcity was only relieved by large importations from Indo-China, where splendid harvests were reaped. The indications for 1908 were normal crops for Shansi and Honan, but almost complete failure of the wheat crop in Chihli and Shantung; millet, maize, poppy, and other crops also fared badly in the northern provinces. In the province of Kwangtung, in the south, the rice crop has been almost entirely destroyed by a flood. The condition in the Yangtse basin was so bad that the Governor-General of Nanking issued a proclamation forbidding all shipments of grain from the provinces under his jurisdiction.

MINING AND METALS. Coal is found in every province. As far as now known, the larger part of the coal of China is in the northern fields, estimated to contain 605,000,000 tons of coal—about 45,000,000 tons less than the estimate for the Appalachian fields. In North China, particularly in the province of Chihli, the Chinese Engineering and Mining Company, a British corporation, owns coal mines which in 1908 were the most productive in China; their output in 1906 was 958,675 tons. The coal mines of the Shantung Mining Company (see KIAO-CHAU), a Ger-

man corporation, were being worked at Fengtse and Poshan, the product of which in 1906 was 163,000 and 7,136 tons respectively. This company also manufactures briquettes. A very good anthracite is mined by the Pekin Syndicate, a British corporation, in northern Honan. The Tsingkiang mine, in Shansi, yields regularly both bituminous and anthracite coal of good quality. In Manchuria and in the anthracite field of Shansi iron ore is found in conjunction with coal. The working of the mineral deposits in the Anki district of southern Fukien by a Chinese syndicate was authorized by the Board of Public Works. Preliminary investigations showed this concession to contain coal and iron in great abundance, as well as lead and limestone. The mineral resources of the island of Hainan have attracted much attention and two Chinese obtained concessions to work tin and other mines in the Tamchow district. The tin mines are very rich, the ore containing 90 per cent. of metal. The Ta-yeh (Hupeh) iron mines, 70 miles below Hankow, on the Yangtse, were estimated to contain 273,000,000 tons of ore. In 1904 a Japanese company was given the right to work these mines for thirty years. About 150,000 tons of ore annually are shipped from these mines to Japan, and 60,000 or 70,000 to the Han-yang iron works, which have contracted to buy annually from 70,000 to 100,000 tons of ore during the period of concession. The Imperial foundry at Han-yang, on the Yangtse, opposite Hankow, in 1908 was turning out from 5,000 to 8,000 tons of rail a month. By an Imperial decree, all Chinese railways must buy their materials from the Han-yang works whenever possible, and an immense plant for supplying passenger and freight cars, bridge steel, and structural steel was to be erected in 1908. In 1907, the United States Steel Corporation ordered a trial shipment of pig iron ore from these works, and on July 5, 1907, there were shipped 1,500 tons from Hankow direct to Brooklyn. About 15,000 tons of coke for these works are derived annually from Ping-hsiang, in Kiangsi, by way of the Hsiang river. In June, 1908, it was reported that the Han-yang works, the Ping-hsiang coal mine, and the Ta-yeh iron mine were to be amalgamated into a corporation with a capital of 1,000,000 taels, exclusively Chinese. The change has been made in order to enable the works to furnish the supplies needed for railways in China, and to manufacture arms. Antimony refining works have been established at the port of Wuchow, the funds having been provided by the provincial government, which has assumed the sole right of buying antimony in the province of Kwangsi. The antimony mines are in the far west of the province. For a time work was being carried on only spasmodically, owing to the difficulty of obtaining good coal at a low price. Now, however, coal mines have been opened in the northeast of the province, and toward the middle of 1908 it was reported that coal of a suitable quality and price would shortly be obtainable. The annual capacity of the works is 1,300 tons of pure metal. Other ores mined in China are copper, zinc, silver, and gold.

MANUFACTURES. The modern textile industry has taken root in parts of the country. Steam filatures for winding silk from cocoons have been established at Shanghai, Canton, Chefoo, and other places. In 1906 there were 27 modern cotton spinning mills, of which 12 were in Shanghai, besides one in Hongkong, which turn out

yarn for the Chinese market. These 28 mills have about 750,000 spindles, and consume annually about 375,000 bales of cotton. To supply the demand of the weaving mills, there were imported in 1907 2,273,419 piculs (of 133½ pounds each) of cotton yarn. The government is encouraging the establishment of modern industries by natives, and, as in the case of the Han-yang iron and steel works, is itself taking a hand in establishing them. In 1908 an order was issued that only domestic cloth should be used in the uniforms of the army, the police, and the schools. This order affects about 200,000 soldiers, 200,000 police, and over 600,000 pupils and students, all of whom receive military drill. Some of the cotton mills have been financed by the government. There is an increasing demand for underwear of the foreign type by all classes of the population, male as well as female. In 1907 the Canton Knitting Company began operations with a steam factory having 34 machines for the manufacture of foreign hosiery and underwear. The output of lace by the Amoy lace guild is increasing steadily; it is made by hand from the best Irish linen thread, compares favorably with the best laces, and finds a market principally in the United States. The government of Hupeh province is to establish a screw and nail factory. In Wuchang a thread factory is to be established with a capital of 500,000 taels (about \$350,000), and in 1908 a paper mill was being erected. In the spring of 1909 English experts were to arrive to teach the people these industries. The Hankow flour mills alone turn out 33,750,000 piculs a year, the grain coming chiefly from Honan. Modern flour and rice mills are being established in the large cities. Soap factories have been established in Nanking.

FOREIGN COMMERCE. The imports (less re-exports) and domestic exports of China in 1907 amounted to 416,401,369 and 264,380,697 Haikwan taels respectively, against 410,270,082 and 236,456,739 Haikwan taels respectively in 1906. (The average value of the Haikwan tael in 1906 was 80 cents, and in 1907, 79 cents.) The most significant features of the import trade in 1907 were as follows: The general condition of trade was depressed, due to the crop failure of 1906 and the overtrading of 1905 and 1906. Importations were made only for immediate disposal, and the holders of large stocks were waiting for their depletion. The excess of 6,131,287 Haikwan taels in the value of imports over that of 1906 is due mainly to the exceptionally large imports of flour and rice, and, to a much smaller extent, to increased imports of railway material. The value of flour and rice imports in 1907 exceeded that of 1906 by Haikwan taels 20,356,000, while that of railway material increased by Haikwan taels 1,364,822, giving a combined increase of Haikwan taels 31,720,822. Deducting this sum from the total imports, there would be left only Haikwan taels 385,000,000 for ordinary imports. The decrease is most marked in cotton goods, which fell from Haikwan taels 181,452,953 in 1905, to Haikwan taels 152,727,845 in 1906, and Haikwan taels 118,915,923 in 1907. In 1905 they constituted 40 per cent. of all imports; in 1906, 37 per cent.; and in 1907, 27 per cent. Plain fabrics (undyed shirtings, sheetings, T-cloths, drills, and jeans) were imported in 1907 to the number of 9,786,025 pieces, against 20,247,123 pieces in 1906 and 27,724,980 pieces in 1905. By far the greater part of the decrease was in goods of American origin, chiefly sheet-

ings and drills, in which previous over-importation was most marked. The principal countries of supply were as follows (number of pieces):

	Great Britain	United States	Japan	British India.
1905	13,548,025	12,566,093	780,580	650,636
1906	10,785,227	8,544,165	733,436	85,003
1907	8,224,950	578,647	840,401	67,905

The imports of cotton yarn amounted to 2,273,419 piculs (1 picul = 133 1-3 lbs.), against 2,541,222 piculs in 1906. Indian yarn fell off by 200,000 piculs, Japanese by 90,000. Fancy cotton, i. e., all cotton fabrics not classed above as plain, were imported to the value of Haikwan taels 32,378,590—an increase of Haikwan taels 9,973,982 over 1906. Metal imports amounted to Haikwan taels 19,942,285—an increase of Haikwan taels 2,652,430 over 1906. Rice imports amounted to 12,765,189 piculs, against 4,686,452 piculs in 1906, the Kwangtung ports alone taking 9,893,232 piculs. Flour imports, distributed evenly among northern and southern ports, were 4,414,383 piculs, against 1,784,681 in 1906. (For the causes of the great increase of rice and flour imports, see above under *Agriculture*.) Cigarette imports declined from Haikwan taels, 5,846,781 in 1906 to Haikwan taels 3,714,760. Aniline dyes fell off slightly, but artificial indigo increased from 73,848 piculs in 1906 to 98,442 piculs. Kerosene oil rose from 128,687,690 gallons in 1906 to 161,284,355 gallons. The increase is covered by American oil, which rose over 50 per cent., while Borneo oil fell off by 1,011,004 gallons, and Sumatra oil increased by 316,259 gallons. The import of Indian and Ceylon tea increased by 48,888 piculs—nearly the whole of the import going to Hankow for mixing purposes. The re-export of Amoy tea, imported from Formosa, again fell off heavily, and another year like 1907 will see the total extinction of this trade, formerly so flourishing. The import of sugar was 5,723,871 piculs, a decline of 821,871 piculs from 1906. There was no marked change in the relative position of the countries of import. All the leading European countries showed slightly smaller values than in 1906. The United States showed a decrease of Haikwan taels 7,532,733, due entirely to the almost complete cessation of the piece goods trade. The decrease would have been very much greater, were it not for compensations in other imports. The value of British Indian imports has remained about unchanged. Japanese imports show a slight loss, due in part to Formosa tea. Hongkong shows an increase of about Haikwan taels 11,000,000.

The most significant features of the export trade are as follows: Silk, raw and manufactured, increased from Haikwan taels 71,295,525 in 1906 to Haikwan taels 89,084,034, about 25 per cent. All descriptions show an increase, with the exception of wild raw silk, which lost 1,659 piculs, and unclassified products, which show a slight reduction. White raw silk increased from 3,628,959 pounds in 1906 to 3,801,515 pounds; yellow silk increased from 1,584,404 pounds in 1906 to 1,793,685 pounds; white filatures increased from 6,107,939 pounds in 1906 to 6,704,457 pounds; waste silk exports were 14,377,605 pounds, exceeding any previous year;

silk piece goods and Shantung pongees showed increases of 25 and 50 per cent., respectively.

The season was favorable to the tea crop, and tea shipments were larger than in any year since 1903. They amounted to 1,610,125 piculs, valued at Haikwan taels 31,736,011, showing an increase of 205,997 piculs and Haikwan taels 5,106,381 over 1906. Leaf tea regained some of the ground lost in recent years to brick and tablet tea, the former having risen from 808,094 piculs in 1906 to 995,170 piculs, while the latter, rising from 596,034 piculs in 1906 to 614,955 piculs, showed a much smaller increase. The total exports of tea, including those to Siberia and Mongolia, *via* Hankow, were 1,612,217 piculs (214,962,267 lbs.), against 1,412,780 piculs (188,371,000 lbs.) in 1906. The exports of black tea were 708,273 piculs; green tea, 264,802 piculs; brick, 604,226 piculs; dust, 22,095 piculs; tablet, 10,729 piculs; all kinds overland to Siberia and Mongolia *via* the Han river and Fancheng, 2,092 piculs. The leading countries of destination were as follows, in piculs:

	1905	1906	1907
Great Britain	356,853	87,270	157,372
Hongkong	83,659	91,373	99,141
Total British Empire	468,942	205,457	292,274
Russian Empire	603,327	947,833	990,803
Rest of Europe	60,075	69,242	91,509
United States	182,123	152,029	201,740
Canada	9,624	12,126	13,382

The amounts of tea sent in 1907 to Russia by the various routes were as follows, in piculs: European ports, 189,002; overland, *via* Tientsin and Kiakhta, 190,542; Pacific ports, 609,167; overland from Hankow, 2,092. The route *via* the Russian Pacific ports and the Siberian Railway was gaining at the expense of the old highways of trade. Indeed, as regards the old overland route *via* Tientsin and Kiakhta, the Tientsin trade report found reason to doubt whether any considerable portion of the tea sent that way reaches Russian territory at all, the probability being that it is consumed mainly within the confines of the Chinese Empire.

Beancake shipments were 4,182,009 piculs—an increase of 265,966 piculs and Haikwan taels 2,084,202 over 1906. Owing to the keen demand in Japan, the chief foreign customer, the average price rose from Haikwan taels 1.80 to Haikwan taels 2.19 per picul. The rise of price in the north sent many purchasers to the Yangtse, with the result that 13 per cent. of the whole direct export went from Hankow, Chinkiang, and Shanghai. Manchuria contributed 83 per cent. of the total export, and Shantung only 3 per cent., against 20 per cent. in 1906. Raw cotton, of which also the bulk goes to Japan, amounted to 988,055 piculs, an increase of 28 per cent. over 1906. Nankeens, chiefly sent to the Russian ports and Hongkong, amounted to 51,233 piculs—barely half the previous year's shipments. The export of matting increased. The wool export was 355,829,000 pounds, of which the United States took 273,909,000 pounds, valued at Haikwan taels 2,829,828.

The following table shows the foreign trade of China for 1907 by countries. The column for imports shows a greater total than in the

above statement of imports, owing to the fact that re-exports are included:

	Imports (including re-exports).	Domestic exports.
	Haikwan taels.	Haikwan taels.
Great Britain	77,562,700	12,107,645
Hongkong	155,642,016	97,226,434
British India	32,913,847	3,179,695
Singapore and Straits Settlements	5,347,638	4,059,515
Australasia	777,952	199,563
South Africa and Mauritius	130,580	55,484
Canada	1,130,374	701,466
Total British Empire	273,505,107	117,529,802
Japan	57,461,410	39,347,476
United States	36,903,476	26,597,660
Russia	913,351	17,201,208
Germany	16,177,400	6,109,195
Belgium	10,581,048	3,978,652
France	3,158,626	30,658,585
Other countries	30,371,244	22,958,119
Total	429,071,662	264,380,697

The coastwise trade of all the treaty ports was as follows, in Haikwan taels: Imports, 137,552,030, and exports, 126,669,687, against 158,276,129 and 133,715,257 respectively, in 1906. The trade of the principal treaty ports in 1907, exclusive of the imports of native produce in the coastwise trade, for which no separate returns were published, is given in the following table, in Haikwan taels:

	Net foreign Imports	Exports of native produce*
Newchwang	10,587,235	15,711,583
Tientsin	61,208,744	17,253,215
Chefoo	10,630,697	10,719,072
Kiukiang	16,416,053	8,478,325
Chungking	13,322,204	11,079,936
Hankow	45,157,364	60,427,393
Kiukiang	11,123,331	16,351,841
Wuhu	9,148,164	9,173,633
Nanking	5,315,221	3,552,873
Chinkiang	19,666,665	5,520,197
Shanghai	46,328,982	73,737,546
Ningpo	12,509,099	9,024,036
Hangchow	4,789,000	10,301,995
Foochow	7,862,349	9,578,919
Amoy	11,230,467	2,819,724
Swatow	18,038,741	14,258,476
Wuchow	5,335,616	3,822,393
Canton	29,894,602	55,342,558
Kowloon	29,820,314	16,192,146
Lappa	12,541,216	4,567,569
Mengtaz	5,973,115	3,563,329
Antung	2,033,054	2,185,455
Dairen	10,423,003	3,231,145

* Including exports to other Chinese ports.

Attempts to regulate the opium habit, which has done infinite harm in China, have been made for several years, and in 1908 an agreement was made with Great Britain, restricting the importation during the year of opium from India. See *History*.

SHIPPING. The following table shows the number of vessels, both steam and sail, and ton-

nage, entered and cleared at the treaty ports in 1907, distinguishing the principal nationalities:

	Vessels.	Tons.
British	27,495	33,316,618
German	5,864	6,639,767
Japanese	29,296	15,598,213
French	5,072	4,712,188
American	549	1,045,899
Norwegian	1,110	1,067,110
Russian	147	264,042
All other foreign	1,206	779,282
Total foreign	70,739	63,423,119
Chinese modern shipping	33,772	11,598,697
Chinese junks	113,421	5,087,608
Total Chinese	147,193	16,686,305
Grand total	217,932	80,109,424

The following table shows the percentage of British, German, Japanese, and Chinese shipping at the Chinese treaty ports in 1907, giving the percentage of the total tonnage employed, as well as of the tonnage employed, respectively, in the foreign and coastwise trade:

	Percentage of total tonnage	Percentage of tonnage in foreign trade	Percentage of tonnage in coasting trade
British	41.59	48.12	44.74
German	8.29	10.60	7.26
Japanese	19.47	15.33	9.83
All other foreign	9.82	12.61	2.90
Total foreign	79.17	86.66	64.73
Chinese	20.83	13.34	35.27
Total	100.00	100.00	100.00

In 1907 the modern Chinese merchant marine contained 50 steamers of 43,738 net tons.

INTERNAL COMMUNICATIONS. Roads are numerous, but badly kept. The canals and rivers, even more important for internal trade, are navigated by native junks, as well as modern steamers. The length of completed railway in 1907 was 3,746 miles, and of lines under construction, 1,622 miles. On March 28, 1908, was celebrated the opening of the line from Shanghai to Nanking, 193 miles. This line was regarded as a forerunner of a complete link between the coast and the undeveloped resources of the West. In January, 1908, the government concluded a loan of £5,000,000 for the construction of a line from Tientsin to Pukow, approximately 700 miles long. Work was begun at Tientsin on June 30, 1908. This will be an important trunk line. Starting from Tientsin, where it will connect with the Imperial Railways of North China, it will run in a southerly direction to the borders of Shantung, traverse the western district of the latter province, and effect a junction at Tsinanfu with the German line running from that point to Kiaochau and Tsingtau. Thence, by way of Ihsien, on the southwest border of Shantung, it will pass into the province of Kiangsu, eventually arriving at Pukow, the southern terminal on the Yangtse, opposite Nanking. It will serve a densely populated and exceedingly fertile country, and will be in connection with three open ports. The construction of the Amoy-Changchow branch of the Fukien lines was begun in July,

1907; it was to be completed in the spring of 1909 and was to be 36 miles in length. The line from Pekin to Kalgan, near the edge of the Mongolian plains, 140 miles long, was completed; it was built entirely by Chinese. The Chentung-Taiyuan branch of the Pekin-Hankow line was opened on December 6, 1907, the construction of the 182 miles having taken three years and three months; another branch from Kaifeng to Chen-chou was opened earlier in the year. Work on the Canton-Kowloon line was also being pushed. The Hsinmintun-Mukden line was redeemed by China at a cost of \$1,666,000. The proposal of China to extend the Imperial Railways of North China from Hsinmintun in a northwest direction to Fakumen, in southwest Manchuria, to the west of the Liao River, was at first vetoed by the Japanese government, on the ground that the line will compete with the Southern Manchurian Railway. Japan contended that in 1905, after the conclusion of the Russo-Japanese war, China agreed not to construct any main line in the neighborhood of that railway or parallel to it. Great Britain supported Japan's contention, notwithstanding the fact that China had made arrangements with a British syndicate for financial assistance in the construction of the line. Later, however, an accommodation was arrived at, Japan agreeing to the construction of the line on condition that it should not be within a minimum distance from the Manchurian line. In the middle of 1908 the Chinese government published a vast programme of railway construction, involving a southern trunk line from Pekin to Canton, 1,200 miles, of which the line from Pekin to Hankow, 754 miles, was in operation; a northern trunk line from Pekin to Urga, in Mongolia, of which the line to Kalgan (see above) had been completed; an eastern trunk line from Pekin to Aigun, on the Amur River, at the Siberian frontier, over 1,000 miles, of which the line from Pekin to Hsinmintun was in operation; and a western trunk line from Pingyang, on the Pekin-Hankow line, through Taiyuan, the capital of Shensi, to Lanchow, on the upper Hoang River, then through Tibet and into Chinese Turkestan to Kuldja, about 2,000 miles from Pekin. Besides these trunk lines there were to be a considerable number of branch lines covering the empire with a network of rails.

The telegraph lines have a length of over 23,470 miles, all under government control. The number of post offices and postal agencies in 1907 was 2,803, an increase of 707 over 1906.

GOVERNMENT. The form of government is that of an absolute monarchy. In practice it is limited by the existence of advisory bodies, such as the Grand Council, the Government Council, and the Board of Censors, and by the powerful viceroys. An Imperial decree of September, 1906, promised constitutional government when the people should be ready for it, and urged the introduction of reforms meanwhile. On Aug. 27, 1908, there was promulgated a constitution, containing guarantees of personal rights and promising a parliament for 1917. According to the edict of Nov. 6, 1906, the central administration is divided into ten departments, namely, the Boards of Foreign Affairs, Commerce, Civil Office, Revenue, Ceremonies, War, Punishments, Communications, Interior, and Education. The navy is under the viceroys of Tientsin and Nanking. The dependencies are under a department known as the Mongolian Superintendency. China proper is divided into 18 prov-

inces, under viceroys or governors-general, subdivided into prefectures and districts. Several prefectures are united into a tao, or circuit, under a taotai. In 1906 municipal self-government was introduced in Tientsin by Viceroy Yuan-Shih Kai. The Emperor Kwang-Hsu, who ascended the throne Jan. 22, 1875, died Nov. 14, 1908. The Empress Dowager Tze-hsi, who had been the real ruler since September, 1898, died the next day. The succession devolved upon Pu-yi, born in 1903, by the nomination of the Empress Dowager, and Prince Chun, father of the infant Emperor, and brother of Kuang-Hsu, became Regent. See *History*, below.

FINANCE. No statements of revenue and expenditure are published. The principal sources of revenue are the land tax, the salt monopoly, the *likin* or internal customs, and the maritime customs. The yield of the last amounted in 1907 to Haikwan taels 33,861,346. In 1901 the revenue of the empire was estimated at Haikwan taels 88,200,000, and the expenditure at Haikwan taels 101,120,000, one-fourth of the latter being the cost of the national debt. Owing to the increased expenditure resulting from the indemnity of 1901 on account of the Boxer outbreak, the viceroys and governors were instructed to increase their annual remittances to the Central Government by Haikwan taels 18,700,000 during the period 1902-1910. The national debt at the end of 1907 amounted to about \$618,000,000, including the 1901 indemnity of Haikwan taels 450,000,000. The capital of the indemnity is to be paid in 39 annual installments, which fall due on January 1 of each year up to 1941; interest at 4 per cent., payable half-yearly, amounts to Haikwan taels 18,829,500. The securities for the indemnity are the maritime customs and salt monopoly, otherwise unappropriated, and the native customs, or transit dues, within 16 miles of the ports. The proceeds are paid monthly to a commission in Shanghai. For the remission by the United States of a part of the Boxer indemnity, see UNITED STATES, under *Foreign Relations*. The charge of the national debt in 1907 was \$35,999,778.

ARMY AND NAVY. The military forces of China in 1908 consisted of the regular army (Lou-Kiun); the police army (Siun-djin Kinn); the auxiliary police army (Siun-djin-toué); the Imperial Guard (Hou-wei-Kiun); and the gendarmerie (Djin-teha-toué). The old organization consisted of the Manchu army of the Eight Banners (Pa-tchi); the Chinese army of the Green Flag (Lou-ying); the Mongolian and Tibetan militia; the Provincial militia and Special Reserves (Ioan-lien); and the special guards of the mandarins. Practically all of these organizations have come under the direct or indirect authority of the Minister of War. The armies of the Eight Banners and the Green Flag are little more than an army of pensioners, while the Provincial militia and the Special Reserves, and the Guards of the Mandarins form the real nucleus of the modern Chinese army. There was up to 1908 no regular budget for the entire army, old and new, but the sum total of the appropriations for the past year was approximately 60,000,000 taels or 210,000,000 francs. It was estimated that the annual budget for the new Chinese army when the thirty-seven divisions and auxiliary organizations are all formed, that is in 1913, will be about 92,000,000 taels, or 322,000,000 francs.

The regular field army (Lou-Kiun), organized and trained in a uniform manner, is intended for war purposes only, and is subject, exclusively, to the orders of the general government. Its formation was to be completed in October of 1912, when it will consist of thirty-seven divisions, having a total of 27,713 officers and 435,268 men, of which 13,357 officers and 377,789 men are combatants. On a war footing the complete organization of the thirty-seven divisions would have a total strength of 678,284 officers and men of all grades, of whom 567,284 are combatants. In 1920, if plans are carried out, there will be in the Chinese army thirty-seven active divisions, thirty-seven reserve divisions, thirty-seven mixed reserve brigades, and 111 depot battalions, with a total strength of 1,418,000 officers and men, and a fighting strength of 1,185,000 of all grades.

On the 1st of July, 1908, there were already in the service 9,696 officers and 189,385 men, the actual combatant strength being 5,417 officers and 165,277 men, of whom 120,000 were fairly well trained. These troops were organized into nine divisions and thirteen mixed brigades, consisting of 216 battalions of infantry, forty-three squadrons of cavalry, eighty-one mountain batteries, twelve battalions of engineers, ten battalions of train, and sixteen machine gun companies.

The Police Army (Siun-djin-Kiun) pertains to the Ministry of the Interior and relieves the regular army of the duty of maintaining order in the different provinces. The actual strength in 1908 consisted of about 47,000 officers and agents, and there were twenty-eight police schools with 5,440 pupils.

The Auxiliary Police Force (Suin-fang-toué) is a sort of provisional army, recruited from the old organization of the Green Flags and maintained by the province pending the complete organization of the regular army. In 1908 there were 130,000 fighting men in the 430 battalions and 119 squadrons of the old organization; all of which will cease to exist as such in 1920, when the units will become part of the regular army reserve.

The Imperial Guard (Hou-wei-kiun) is composed of Manchus of the Three Banners placed under the orders of the Emperor and constituting the palace guard. It formerly had an effective of 12,000 men, and was reduced to 3,000, while the actual strength is only 1,800, the gradual reduction being made for the purpose of creating a new organization to replace the old which is very much inferior to the infantry of the new regular army, of which a regiment of the 6th division is already on duty at the palace.

The Gendarmerie (Djin-tcha-toué) is a sort of provost guard and police troops for the army, which have already been organized in the 2d, 3d, 4th, 8th, and 9th divisions.

The armed forces of China in times of peace consisted in 1908 of about 690,000 combatants with 930 field guns, of which 120,000 regulars, 50,000 men of the police force, and 50,000 Mongolian cavalry are armed and trained in modern methods and could take the field against a modern army. In 1913 the organization of the regular army should be complete, according to programme, and number 400,000 men; in 1920 the organization of the reserves should be complete, and bring the total to 1,185,000.

NAVY. The navy consisted in 1908 of 6 protected small cruisers, aggregating 15,900 tons; 6 unprotected small cruisers, 12,400 tons; 5 gunboats, 2,800 tons; 4 destroyers, 3,590 tons; 5 torpedo boats, 600 tons. Total, 26 ships of 35,295 tons, showing an increase in 1907 of 565 tons. The crews number about 3,200.

MONEY, WEIGHTS, AND MEASURES. On October 5, 1908, an Imperial decree was issued, ordaining the introduction of a silver currency of which a coin weighing one K'u P'ing, or treasury tael, is to be the unit. The new tael and half-tael coins are to be 98 per cent. pure silver, and there will be subsidiary 10 cent and 5 cent pieces of 88 per cent. pure silver. The Board of Finance and the provincial authorities were ordered to take measures for the early introduction of the new coinage into general use. No ratio was fixed between the copper currency and the new tael coinage, and no indication was given whether the new coins were to be issued solely from mints under the direct control of the Board of Finance. The British Minister to China remarked that without provisions on these two points it could hardly be said that a national coinage is likely to result from the decree, though it is possible that supplementary enactments would safeguard the interests of the Central Government.

In 1904 a memorial was submitted to the throne praying for a uniform system of weights and measures. In April, 1908, the matter was again brought to the notice of the Central Government, and was referred to the Council of Reforms. The report of that council, published on September 3, 1908, recognized the difficulty of suddenly introducing a new system, and advised the adherence to the old Chinese standards, with the addition of certain European instruments. The supplanting of local standards by those of the Central Government was to be gradual. The new unit of length is the "tchi" (=32 centimeters); the new unit of capacity, the "to" (=10.355 liters); the new unit of weight, the "lian" (=37.301 grams).

HISTORY.

THE PROGRESS OF REFORM. The year 1908 was marked by a new step in the constitutional movement. An Imperial edict, an outline of which is given in a succeeding paragraph, contained more definite promises than ever before as to the constitution and set forth the conditions to be observed before its promulgation. In common with other countries the history of constitutionalism in China has been marked by alternative progress and reaction. The year 1907 had been in the main a year of retrogression. The announcement in November, 1906, that a constitution would be given when the nation was fitted for it, and outlining certain administrative reforms, caused a strong reaction, and for a time the conservative element was successful. The influence of Yuan-Shih-Kai, the viceroy of Chi-li, who was regarded as the leader of the Progressives, was undermined. In the latter part of that year, however, there were signs that the reform movement was recovering its ground. Viceroy Yuan was appointed to the Grand Council and to the Ministry of Foreign Affairs, and on December 25, 1907, an edict was issued to the effect that a constitution would be promulgated as soon as certain laws had been made and as soon as the people had shown the requisite capacity. Meanwhile in September commissioners had been appointed to study constitutional sys-

tems in Great Britain, Germany, Japan and other countries. This impulse toward the study of foreign constitutional movements had begun to manifest itself after the Boxer insurrection. Chinese students of European institutions took up their residence in several countries. The constitution of Germany seemed to attract them most strongly, and a mission sent for constitutional study to Europe three years ago seemed inclined to a form of government for China that united the German with the Japanese system; that is to say, retained for the Emperor certain unassailable prerogatives. The mission's report was referred to the commission for the preparation of the constitution, which is composed of the most important personages in the Empire. The ardent reformers objected to the delay imposed by the Emperor, and in answer to arguments that a constitution should not be granted until the people developed the necessary political capacity, pointed to the ignorance and incapacity of the Imperial Government itself, which had failed to turn to account the great resources of China, and had left her a prey to far weaker and smaller foreign nations. Among the extremists, the feeling was expressed that these delays were merely for the purpose of deceiving the people.

THE NEW SPIRIT IN CHINA. Much has been written during the last few years about the awakening of China. Among the many illustrations of this new spirit, a few may be briefly mentioned here. The constitutional movement arose mainly from the humiliation and anger of the people over the encroachments of foreign nations. The inability of the government to cope with the foreigner led to inquiries as to the cause. It came generally to be believed by students that the difference between China and these other nations in efficiency was the result of the difference in their institutions. Hence the desire to frame institutions on western models, that the strength of the Empire might so increase as to enable it to deal on more equal terms with competing nations. Chinese patriotism was greatly stimulated by the victory of Japan over Russia, which deprived the white race of a great part of its prestige. It pervades all classes of society and has led to a widespread inquiry as to the cause of the Empire's weakness. The students brought back from western countries many philosophic and political treatises, and these were translated and widely circulated. The Chinese press, although it is under censorship, has abounded in radical political discussions. The theories of Rousseau on liberty and equality have formed the text of many articles. The publication of such matter has naturally offended the conservative classes, the princes and the great dignitaries, but they seem to have realized that they are in the presence of a new force, and at times have given way to the reform impulse under pressure of necessity. Hence the alternating periods of reform and reaction. There is already a violent revolutionary element in the country, as was shown at the beginning of 1908, when a band equipped with explosives landed in China from Japan. This anarchist movement was suppressed by the police, but there were signs that it ramified even into the ranks of the Civil Service. The characteristic, however, of the new spirit in China is rather that of a strongly awakened national feeling; such for example as prompted many students to commit suicide as a protest against the action

of the authorities in the matter of railway concessions to foreigners, called out immense crowds who followed their funeral processions, and impelled the very lowest members of society to subscribe for shares in the national railways. It was well illustrated again early in 1908 on the occasion of the Tatsu Maru incident.

THE TATSU MARU AFFAIR. On February 5, the Chinese custom officers seized the Japanese steamer Tatsu Maru in Portuguese waters off Macao, where it had landed to discharge arms shipped from a Japanese port to a Chinese merchant at Macao. The Japanese bitterly resented the seizure and complained at once to the Chinese authorities, demanding an indemnity and an apology. They declared that the seizure was unwarrantable, the ship being in Portuguese waters, and the order having been sanctioned by the Macao authorities. The Chinese at first defended the seizure, saying that it had not occurred in Portuguese waters, but offered to submit the case for arbitration to the British admiralty. Later, however, Japan having sent an ultimatum (March 5), China tendered an apology and gave assurances that damages would be paid and the responsible persons punished. Japan on her side agreed to prevent the traffic in arms and ammunition between China and Japan. The vessel was released and the damages were paid. Friendly relations between the two governments were restored, but meanwhile the incident had greatly inflamed public opinion in China, and a boycott of Japanese goods had begun. A mass meeting was held at Canton, where 50,000 Chinese were said to have gathered. Violent language was used in regard to the weakness of the Chinese government and the insolent attitude of Japan. The excitement on this occasion was intense. Many of the people tore off the Japanese clothes that they were wearing and burnt them in a bonfire. Thousands of women dressed in mourning left their dwellings, held meetings, and made speeches. They adopted as an emblem a ring on which were engraved the words "National shame," to preserve the memory of this affront to their patriotism. It was estimated that the boycott which then began cost the Japanese some \$8,000,000. News of the affair spread throughout the greater part of the country through the vernacular press, and everywhere the national feeling was deeply stirred. During the year a great number of Japanese vessels left Chinese and other foreign ports without the goods for which they had come.

Serious difficulties on account of the boycott arose at Hong Kong (q. v.). The feeling against Japan as illustrated in this incident was intensified by the latter's course in Manchuria, where she retained the public buildings at Mukden and the Manchurian gold mines, occupied a portion of the province of Kirin, which she claimed as Korean territory, although it had long been held by China, and took possession of the Manchurian post offices and telegraph lines. She had also forbidden the building and operation by China of the railway to the west of the Liau River, from Hsenmintun to Fakumen, on the ground that it competed with the Japanese system.

These difficulties were settled in the course of the year. Japan agreed to the construction of the Fakumen road on condition that at no point should it come beyond a minimum distance from the Manchurian line. Agreements regarding the Manchurian telegraph lines were signed

at Tokio on Oct. 12 and Nov. 7. Japan agreed to hand over to China all Japanese telegraph lines in Manchuria outside her railway territory and to construct no telegraph or telephone lines in Manchuria outside her railway territory and to construct no telegraph or telephone lines or erect wireless stations outside her leased territory. China undertook to place special telegraph wires between the Treaty Ports, An-tung, Niu-chwang, Liao-yang, Mukden, Tieling, Kwang-cheng-tsze, and the railway territory at the exclusive disposal of the Japanese government for a period of fifteen years, the telegraph service on such wires to be worked by Japanese clerks in the employ of the Japanese government from the Chinese telegraph buildings, but only used for the exchange of telegrams from or to places under the direct control of the Japanese telegraph system. Japan also undertook to pay China a small annual royalty on all messages forwarded over the Japanese Manchurian telegraph lines.

DIFFICULTY WITH RUSSIA. Early in the year trouble arose at Kharbin on account of the assertion by the Russian authorities of absolute administrative rights and territorial jurisdiction over both Chinese and foreigners within the district of the Eastern Chinese Railway. On February 25, China complained to the Russian government of these alleged encroachments. The United States Consul, Mr. Fisher, sided with China in her demands, and the Russian Government complained on the ground that he had persistently held that he was accredited only to the Chinese government, and had supported the latter's claims for independent municipalities in the railway territory. The attitude of the consul was subsequently explained by Secretary Root, who declared that although the affair was complicated, too much importance had, in his opinion, been attached to it. Although the Chinese Eastern Railway was under Russian control and Russia was endeavoring to enforce her jurisdiction over the greater part of Kharbin, this did not impair Chinese sovereignty, and the United States would not commit themselves to the approval of the stringent Russian police regulations. The American representative was on the same footing as the Russian Consul General at Kharbin, and he held Chinese exequatur. The contention of the foreign element at Kharbin was that they should have a share in the municipal regulation of the foreign quarter, as in other Oriental cities. On the other hand, the Governor General and the railway authorities had issued decrees regulating municipal business and industry in the railway zone.

THE YUNNAN FRONTIER INCIDENT. On June 14 the French Government demanded reparation from China for a raid on a border village on French territory and an attack on the French patrol. For some time past there had been a state of revolt in the Chinese province of Yunnan adjoining the French Tongking possessions, resulting in conflicts and disturbances, and rebels had several times crossed into French territory, where they had been disarmed by the authorities. Finally a band of armed Chinese, alleged by the French to be regulars, pillaged a village not far from Nam-Kuan on the Kiang-si border and later attacked a body of French troops reconnoitering on French territory near Lao-Ké, killing a French officer and six native soldiers. The French thereupon demanded—The punishment of the offenders; the recall of the Viceroy,

Hsi-Liang, who, they said, had already shown an unfriendly attitude toward the French; the payment of an indemnity of 250,000 francs; the compensation for losses sustained by the French railway line in process of construction from Lao-Ké toward Yunnan; and the concession for a railway which should start from Taian-Fou. These demands were regarded by the Chinese as excessive and unreasonable. They were ready to render fair compensation, but contended that the culprits were not regulars but rebels, that the French had permitted the organization of rebellion on French territory, that Hsi-Liang was one of the best of the viceroys, and that while railway schemes were good in themselves they ought not to be demanded in this manner. To make a frontier incident a pretext for a railway concession in a distant province was criticized as being in the spirit of the brutal and dictatorial policy formerly followed by European governments in dealing with China, but now discountenanced. The Chinese government, however, promised to punish the offenders. An investigation was made, and early in November a decree was issued condemning three of them to death, and the others to imprisonment, exile or exclusion from office.

MEASURES AGAINST OPIUM. In accordance with the decree of November 21, 1906, restricting the growth and use of opium, stringent measures were carried out during that and the following year. The policy was continued in 1908. The British government coöperated in these attempts to reduce the opium evil, agreeing early in the year that it would decrease the importation for a trial period of three years. The Chinese government issued a decree which dwelt on the evils of opium taking, referred to the co-operation of the British authorities, and ordered the enforcement of the present regulations and the taking of further measures against the practice. By the regulations issued under the decree of November 6, it was required that within a period of ten years the cultivation of the poppy and the taking of opium should cease, proceeding at the gradual rate of one-tenth yearly. They also provided for the registry of opium users, of the amounts they consumed, of opium shops, of sales, etc.; and they ordered public officers, teachers, soldiers, and sailors to give up the habit. There were some disturbances in different parts of the Empire during the year, arising from these restrictions. The rules were not fully carried out, but nevertheless curtailed the cultivation of the poppy considerably, reduced the consumption, and led to the closing of the opium dens in many places. The prohibition was strictly enforced in the schools and colleges and among the soldiers and police. The decrease in the extent of opium-smoking among the respectable classes could plainly be seen. Yuan-Shih-Kai dismissed two viceroys on account of the slight diminution in poppy-growing under their administration. The Imperial government appointed a commission to inquire into the extent to which the people and the officials were still addicted to the opium habit. An agreement was reached with the British government whereby 51,000 chests were taken as the standard of exportation from India, and from this quantity there was to be a gradual diminution in the imports amounting to 5,100 each year, until after ten years the importation should wholly cease. It was further agreed that more duties should be levied by China on

foreign imported articles; and that there should be no trade in poppy juice between China and Hong Kong. Beginning January 1, 1909, the importation of morphine for other than medical purposes is prohibited. All the Powers have assented to this.

THE ANNOUNCEMENT OF THE CONSTITUTION. On August 27, the Emperor issued a decree promising a constitution. The instrument itself was said to be modeled largely on Japanese lines, and to comprise a representative parliament and a Bill of Rights prescribing freedom of speech and of the press and the right of assembly to all who kept within the law. It left in the hands of the sovereign the right of promulgating the laws, calling and dissolving parliament, receiving and appointing ambassadors, receiving money when parliament is not in session, and fixing the imperial household expenses. The Emperor also retained the command of the army and navy, the power of peace and war, and the appointment of judges. The edict making the announcement may be briefly summarized as follows: It declared that the members of the Senate and of the commission for the preparation of the constitution, together with the royal princes, have submitted a collective report and offered a body of rules concerning the choice of members of Parliament, and that in this report they treat of the measures which it is necessary to observe before a parliament is established. It goes on to say that the country is extremely weak and that a great number of changes must take place in public affairs. If the Court and the entire people do not share the same ideas, it will be impossible to maintain the stability of the state. If legislation does not conform to right and justice, the public peace cannot be assured, and if the magistrates and the people do not conform to justice in their relations, it will be impossible to make rapid progress and attain satisfactory results. "In the project put forth by the aforesaid dignitaries, everything that concerns the constitutional laws and the choice of members of Parliament has been examined in a very thorough manner, article by article, and the separation of powers is therein set forth; moreover the princes have chosen the best features of foreign constitutions and demand that the people conform thereto, without however discarding the Chinese religion." The supreme power must remain with the court while the right of the people consists in deliberating on all public affairs. When the provisions of the constitution and the rules for the choice of members of Parliament are drawn up, the separation of powers as between sovereign and people will be considered, and if this principle is steadily observed encroachment will be impossible. So long, however, as constitutional provisions are not promulgated and Parliament is not assembled, existing legislation must be faithfully obeyed, and the people must await the measures of the court for the establishment of the new system. The decree orders the Senate and the commission for the preparation of a constitution to require the distribution of printed announcements on yellow paper with the imperial seal in all the administrations of the capital as well as to the viceroys, governors, the prefect of Peking, and the highest officers of the provinces, who shall post them in the principal rooms of their palaces. The magistrates

of the capital and the provinces shall conform to all the rules set forth in these documents, and every six months shall make a detailed report to the Emperor of all the measures that they have taken relating to these subjects, and shall also inform the commission for the preparation of the constitution, who shall collate this material. "The ministries and the provincial administrations must treat these matters in the same spirit, and the ministers must themselves examine the acts of the authorities and render us a report; we also command the princes who are members of the aforesaid bodies to lay before us a plan for the establishment of a special bureau charged with the supervision of the administration of functionaries. At Peking the imperial censors must devote all their attention to the same object." Then follow warnings against any failure to observe these rules, and an urgent command to the chief officers of the administration to do everything possible to remove abuses. As to the institution of Parliament, the date was fixed nine years hence, within which period all the preliminary measures must be carried out. When the date arrives the imperial rescript will promulgate and convoke Parliament. In conclusion the decree reads: "Let all our subjects, magistrates, and commanders exercise all their efforts to contribute to the good administration of the country. If it happens that people of suspicious reputation gather to discuss bad principles, seek to stir up strife or agitate for the purpose of disturbing the public order and bringing about evil conditions, the Court will apply to them in all their rigor the legal penalties, and will not endure any disturbance of the public peace."

Some steps had already been taken to prepare the way for constitutional government: thus the Imperial government had provided for general councils of the provinces and had decided not to oppose the local assemblies which had sprung up in some places. In these councils the principle of popular rights is not recognized either in practice or in theory. The members of these bodies are chosen by the mandarins (who represent the princes), either as a result of their personal investigations or by ratifying the representatives chosen by the notables who are the electors in the first instance. On July 22, 1908, the emperor addressed the people on the subject of these councils. He said that the councils were deliberative bodies for the discussion of affairs of public interest and formed the first stage for admission to the Senate. They were to serve as a basis for the future Parliament. He declared that it was desirable that in every province these deliberative councils should be employed to exercise the political capacities of the people, and he urged his subjects of all classes loyally to take part in these labors, to indicate the measures of progress that they think essential, and the abuses that they think should be suppressed in their provinces. He enjoined the viceroys and governors on their part to consider all these proposals for improvement. This decree greatly encouraged the reformers and led some of the governors to recommend even the establishment of municipal councils like that of Tientsin, where for the past year a council of 35 members, chosen from an electoral body of 70,000 nobles, has been in action. The demand for a definite announcement as to the date for

the promulgation of the constitution grew stronger, and in response to this came the decree of August 27, above quoted. The date fixed in this decree was not satisfactory to the ardent reformers, who asked why it was necessary to put off for nine years the establishment of a system which would add so greatly to the strength of China. In many quarters the demand was made for an immediate establishment of a national Parliament, and it was reported that the Government was considering a shorter term of preparation than that imposed by the decree.

THE DEATH OF THE EMPEROR AND THE DOWAGER EMPRESS. Kwang-Hsu, Emperor of China, died on August 14, and his death was followed on the next day by that of the Empress Dowager, Tze-Hsi. Kwang-Hsu, though nominally enjoying the full imperial power since he came of age in 1890, was actually greatly restricted in his rule by the Dowager Empress, who had acted as regent during his minority, and even afterwards retained a large measure of control. Her influence is generally admitted to have been exercised against all measures of reform, and she is said to have thwarted the progressive tendencies of the young emperor at every turn. The reform movement, it will be remembered, gained a temporary and premature victory in 1898 when the Emperor, summoning the reform leaders, asked their advice as to what progressive measures should be adopted, and shortly afterwards issued a series of edicts which if carried out would have revolutionized the administration and set the country on the path of constitutional changes such as had taken place in Japan. The *coup d'état* which followed was attributed to the Dowager Empress, who, taking advantage of the fact that the army had not been gained over by the reformers, caused the palace to be occupied by troops and the reformers to be summarily punished. The Emperor was henceforth completely under her control. Then occurred the Boxer uprising, followed by the ignominious flight of the Court, which humiliated the people and tended to arouse a patriotic determination to build up a country strong enough to withstand the foreigner. After this the Court was unable to resist the growing strength of the reform movement, and the measures above mentioned were taken with the reluctant consent of the Dowager Empress, who from all accounts was at heart a reactionary, though acquiescing in the various progressive liberal decrees from fear of endangering her power by resistance. The decree announcing the death of the Emperor and the Empress Dowager proclaimed the customary period of public mourning, 100 days. It was followed by a decree proclaiming as Emperor Prince Pu-Yi, then in the third year of his age (born February 8, 1906), who assumed the throne name of Hsuan-Tung. His father, Prince Chun, the brother of the late emperor, was proclaimed regent. He was reported to be an enlightened man and in sympathy with the reformer Yuan-Shih-Kai. The peaceful accession of the new Emperor and the announcement of Prince Chun's regency were taken as favorable to the interests of the reform movement. On December 3 an imperial edict reiterated the intentions of the government to redeem its promises of constitutional government as formulated in the edict of August 27.

THE DOWNFALL OF YUAN-SHIH-KAI. The sudden and unexpected announcement at the close of the year that Yuan-Shih-Kai was dismissed from office caused great uneasiness, not only among the reform element but among the foreigners in China, who had regarded the retention of Yuan-Shih-Kai as evidence that the government would continue to be friendly toward foreign powers. The edict proclaiming his dismissal gave no further reason than that "he had rheumatism of the leg"; and after ordering him to vacate his office and return to his home added "Thus our clemency is manifest." Various accounts appeared in the press concerning the career and character of the dismissed minister. By the foreign element he was regarded as a friend of reform and the advocate of an enlightened policy in dealing with foreign nations. By his enemies among the reformers, on the other hand, he was considered merely an opportunist who had made concessions to the cause of progress to serve his own ends, but had really supported the Empress Dowager in undermining the efforts of the reformers. One of his main titles to distinction is his efficient work in reorganizing the military. In 1898 when Viceroy of the province of Shantung, he introduced discipline among the soldiers, who became almost the only effective military force in the Empire. In 1900 he saw that the Chinese anti-foreign policy was doomed to failure; and his course at that time was interpreted by foreigners as indicating a desire to go as far as he could on their behalf, but was criticised by his enemies as wavering and self-seeking. Through him came the information that led the European Powers to ally themselves with the United States in the march on Peking; and he was the first to announce that the imprisoned legations in Peking were still holding out against the Boxers. He is also credited with the new educational policy whereby modern text books have replaced the classics, with the abolition of torture, and with the great sanitary improvements in Peking. Hence he earned the trust of foreigners, who regarded his downfall with grave concern. A meeting was held by the representatives of the Powers at Peking immediately on hearing the news, to discuss means of conveying to the Government their appreciation of the methods which Yuan-Shih-Kai had employed in his dealings with the foreign ministers, and their hope that his dismissal might not mean the reversal of that policy. The real cause of the dismissal and its bearing on the prospects of the reformers were not known at the close of the year.

THE VISIT OF THE DALAI LAMA. On September 28, the Dalai Lama of Tibet paid a visit to Peking. It was the occasion of a very picturesque procession of Tibetans through the city, and many interesting ceremonies. He had left Lhasa after the arrival of the Younghusband Expedition, and for four years had been traveling over China and Manchuria, somewhat to the embarrassment of the Chinese authorities on account of the expenses entailed upon the government for his various receptions. The death of the Emperor and of the Empress Dowager obliged him to remain longer than was expected, and before he left the respect in which he was held by the Chinese was thought to have suffered from the closer view which it afforded into the Tibetan religious practices. The title of "Sincere and Loyal Spreader of Civilization"

was conferred upon him by the Pekin Government, but he was deprived of his temporal power and was thenceforth to be recognized only as an ecclesiastical authority, the Chinese government having officially proclaimed its sovereignty in Tibet. He left the city on December 21. His train comprised 400 persons and a long procession of horses and camels bearing tents.

OTHER EVENTS. On July 20 an edict was issued appointing a special envoy to the United States to express the gratitude of China for the action of this country in restoring to the Imperial government the balance of the Boxer indemnity, which amounted to nearly \$12,000,000. It was announced that China would apply the greater part of this amount of money to the education of selected Chinese students in American schools and universities. In June a college was established in Pekin for the training of Chinese for the Maritime Customs Service. In the same month French advisers were appointed in the Ministries of War and Communications. On April 1, 1908, the Shanghai and Nanking Railway, begun April 25, 1905, was opened to the public. It was financed by British capital and constructed by British engineers. It completes the connection between those two cities, and its total length is 194 miles. In October a division of the American fleet, on its way around the world, called at Amoy.

CHRISTIAN CONNECTION. See **CHRISTIANS.**

CHRISTIAN ENDEAVOR, UNITED SOCIETY OF. A religious society for young people, founded by Rev. Francis E. Clark, at Portland, Me., in 1881. In October, 1908, the organization included 70,608 societies throughout the world, a net gain of 1470 societies over 1908. The total membership is nearly 3,500,000. Work in foreign countries in 1908 was carried on with great vigor. Summer schools were conducted in various sections of the country. A movement started in 1905 to erect a building in Boston for international headquarters has resulted in the raising of over \$75,000 for that purpose. The twenty-fourth international convention of the Society will be held at St. Paul, Minn., July 7-12, 1909, and the World's Convention at Agra, India, November 20-25, 1909. The officers in 1908 were: Francis E. Clark, President; William Shaw, General Secretary; Amos R. Wells, Editorial Secretary; Himan N. Lathrop, Treasurer. The official organ is *The Christian Endeavor World*, published in Boston.

CHRISTIAN SCIENTISTS. The name used to designate members of a religious denomination which was founded by Mrs. Mary Baker Eddy. The doctrines of Christian Scientists are founded upon an interpretation of the Scriptures contained in *Science and Health with a Key to the Scriptures* by Mrs. Eddy, published in 1875. The Church of Christ, Scientist was founded in 1879. The First Church of Christ, Scientist, Boston, Mass., of which Mrs. Eddy is honorary pastor, is the Mother Church of the denomination, all others being branch churches. In December, 1908, there were 1100 churches or societies listed in the *Christian Science Journal*. There are many institutes for teaching Christian Science and upward of 4000 practitioners of Christian Science mind healing. Organizations exist in almost every State in the United States and there are branches in Canada, Nova Scotia, British Columbia, Mexico, the Bahamas,

British West Indies, the Hawaiian Islands, Cuba, Philippine Islands, Great Britain, France, Germany, Norway, Switzerland, Italy, Australia, China, South Africa, and other countries. In 1908 the church numbered 85,096 communicants, 668 churches, and 1336 ministers. The publications of the church are in the hands of the Christian Science Publishing Society which issues the *Christian Science Journal*, the official organ of the church, the *Christian Science Sentinel*, and other periodicals. On November 25, 1908, the Publishing Society began the publication of a daily newspaper, the *Christian Science Monitor*.

CHRISTIAN SOCIALISTS. See **AUSTRIA-HUNGARY.**

CHRISTIANS. A religious denomination in the United States and Canada, which originated in the early part of the nineteenth century. It claims the name Christians "not as a sect name, but fraternally as a name of union." The church allows latitude of theological views and asserts the importance of the fellowship of all followers of Christ. Two bodies, called the Christian Church and the Christian Church South, which were separated in 1854 through failure to agree on the slavery question are now closely affiliated. The denomination, according to the latest available statistics, has 101,597 members, 1340 churches, and 1348 ministers. Missionary and educational interests of the church were carried on by aggressive and energetic measures during 1908. During the year \$15,507 were spent for its missions. In the various schools of the denomination are enrolled about 1,000 students with about 75 instructors. The annual expenditures are about \$75,000. There are 277 Christian Endeavor societies in the church, with a membership of about 7000. The official organ of the denomination is the *Herald of Gospel Liberty*, published at Dayton, Ohio. The meetings of the American Christian Convention, which are quadrennial, will be held in 1910. This representative body has charge of the general, educational, missionary and other interests of the church.

CHRISTMAS ISLAND. A small island in the Indian Ocean, belonging to Great Britain and administratively attached to the Straits Settlements. There are about 1200 inhabitants, mostly Malays. The importance of the island is due to its enormous deposits of phosphates, and nearly all the inhabitants are working for the phosphate company. The shipments of phosphates in 1907 were 110,375 tons, of which Japan took 54,500, Europe 52,600, and Australia over 3000.

CHURCH OF CHRIST, SCIENTIST. See **CHRISTIAN SCIENTISTS.**

CHURCHES OF GOD. A religious denomination whose doctrines agree generally with those held by the Baptists. It was founded in 1830 as a result of the preaching of John Winebrenner, a German Reformed pastor at Harrisburg, Pa. In 1908 the churches numbered 41,475 communicants, 390 churches, and 499 ministers. The churches are divided into 17 annual elderships, delegates from which constitute the general eldership of the Churches of God, which meets every four years. The denomination is strongest in Pennsylvania, West Virginia, and the States of the Central West. A college is maintained at Findlay, O., and a collegiate institute at Fort Scott, Kan.

It has a General Woman's Missionary Society, which has five missionaries in India, with a number of native workers. There is a large publishing house and book store at Harrisburg, Pa. Its organs are: *The Church Advocate*, the *Workman Quarterly*, the *Sunday School Gem*, *The Sunbeam*, and the *Primary Quarterly*.

CLARK, JAMES BEAUCHAMP (CHAMP). An American legislator, representative to Congress (Democrat) from the Ninth Missouri District. He was born near Lawrenceburg, Ky., on March 7, 1850, attended Kentucky University, and graduated at Bethany College, Pa., in 1873. He was president of Marshall College, W. Va., from 1873 to 1874 and then took up the study of law at the Cincinnati Law School. In 1875 he moved to Missouri and subsequently became city attorney of Louisiana and Bowling Green and prosecuting attorney of Pike County. He was presidential elector and a member of the State Legislature in 1880. In 1892 he was elected representative to Congress and has since served continuously in that body, with the exception of the period 1895-97. In Congress Mr. Clark has attained considerable prominence as an orator and debater, and at the beginning of the second session of the Sixtieth Congress he was chosen leader of the Democratic minority, succeeding John Sharp Williams. Mr. Clark is also widely known as a Chautauqua lecturer.

CLARKE, BENJAMIN FRANKLIN. An American educator, died on December 29, 1908. He was born in 1831. In 1863 he graduated at Brown University, was appointed to the faculty of that institution, and remained a member of the teaching staff for the rest of his life. Twice during his career he served as acting president of the university. At the time of his death he was emeritus professor of mechanical engineering.

CLARK UNIVERSITY. An institution of higher learning at Worcester, Mass., founded in 1889. The chief aim of the University is toward encouraging original research, although it includes an undergraduate college department. The attendance in 1908 was 82 in the University and 150 in the College. The University includes nine departments. It publishes the *American Journal of Psychology*, the *Pedagogical Seminary*, and the *American Journal of Religious Psychology and Education*. The endowment of the University and College is \$4,000,000. The President of the University is G. Stanley Hall; the President of the College in 1908 was Carroll D. Wright.

CLEARING HOUSE.

BANK CLEARINGS. Bank clearings in the calendar year 1908 in 101 cities of the United States, as reported by *Bradstreet's*, aggregated \$131,285,367,000, as compared with \$143,991,528,000 for 1907, \$159,135,000,000 for 1906, and \$143,114,000,000 for 1905. Thus the fall was only 8.8 per cent. from the total of 1907. If, however, comparison is made for years ending September 30, then the 1908 total is 18 per cent. less than that of 1907. The clearings were considerably less during the first half of the year than during the second

half. They were also less during the first eight months than in corresponding months in 1907, 1906, or 1905. In September, however, the clearings exceeded those of 1907; they were somewhat less in October than in October, 1907; but in November and December were very much larger than the same months last year. The totals in millions by months in 1908 were as follows: January, \$11,260; February, \$8,662; March, \$9,693; April, \$9,682; May, \$10,781; June, \$9,754; July, \$10,994; August, \$10,165; September, \$10,025; October, \$12,012; November, \$12,875; December, \$14,287. This December figure exceeded that of December, 1907, by 53 per cent., and exceeded that of any month since March, 1907, and was exceeded only by four other months in American history, all of these four being in recent years. Other favorable comparisons, as well as a clear impression of the remarkable business expansion of the United States, may be made by contrasting the clearings of 1908, a year succeeding a severe financial panic, with those of years preceding 1905. They exceeded those of any year before 1905, were 91 per cent. larger than those of 1898, and 189 per cent. larger than those of 1894, the year following the previous severe crisis. Moreover, 26 cities showed gains in 1908 over 1907, and 53 showed gains over 1906. All but one of the 26 and all but 3 of the 53 of these cities were west of the Alleghenies, thus reflecting the favorable condition of agriculture and the very considerable independence of the middle west from the financial condition of the east.

Of the total clearings, \$79,275,880,000 were credited to New York City, or 9 per cent. less than in 1907, 24 per cent. less than in 1906, and 15 per cent. less than in 1905; but exceeding the clearings of any year preceding 1905. The clearings in other large cities in 1908 were: Boston, \$7,338,000,000; Philadelphia, \$5,987,000,000; Pittsburgh, \$2,064,000,000; Cincinnati, \$1,230,000,000; Chicago, \$10,853,814,000; Minneapolis, \$1,057,000,000; St. Louis, \$3,074,800,000; Kansas City, \$1,848,511,000; Baltimore, \$1,240,900,000; and San Francisco, \$1,757,151,000.

The Canadian clearings aggregated \$4,142,000,000 for the calendar year, a loss of 3.9 per cent. compared with 1907. The aggregate clearings in the principal cities were: Montreal, \$1,467,000,000; Toronto, \$1,166,900,000; and Winnipeg, \$614,000,000.

CLEARING-HOUSE CERTIFICATES. Following the outbreak of the financial panic in October, 1907, clearing-house certificates were issued in 50 different cities of the United States. The first issues were made by the New York Clearing House and with three exceptions there were no issues after January 1, 1908. In the larger cities these certificates were used for the sole purpose of facilitating the settlement of balances between member banks. In some centres, however, they were pledged for notes or checks of small denominations intended for general circulation in the place of the customary forms of currency. A summary compiled by the manager of the New York Clearing House, from reports from 106 cities, showed the aggregate of certificates issued to be \$248,279,000. The amounts issued at principal points were as follows: New York, \$101,060,000; Chicago, \$39,240,000; St. Louis, \$15,965,000; Philadelphia, \$13,695,000; Boston, \$12,595,000; San Francisco, \$12,339,000; Pittsburgh, \$7,445,000; New Or-

leans, \$5,266,000: a total of \$207,605,000 for these eight cities. The maximum amount of certificates outstanding at any one time was \$219,857,500, this maximum at New York being \$88,420,000. Of the 52 banks of the New York association 20 did not resort to the use of certificates at all; the largest amount issued to any one bank was \$17,000,000; the interest paid on New York certificates at 6 per cent. aggregated \$1,116,246; and during the period when certificates were in use the New York clearing-house committee received as collateral against certificates a total of \$453,000,000, of which \$330,000,000 was in the form of commercial paper and \$125,000,000 in stocks, bonds, and short-time notes of railroads and other corporations. The last issue of certificates in any city was at New York on January 30. In the majority of cities the final cancellation of certificates occurred some time in January, though the final cancellation at New York took place on March 28, and the very latest was that at Los Angeles on April 28.

CLEVELAND, GROVER. Twenty-second and twenty-fourth President of the United States, died in Princeton, N. J., on June 24, 1908. He was born on Mar. 18, 1837, at Caldwell, N. J., where his father, Richard Falley Cleveland, was pastor of the Presbyterian church. He was christened Stephen Grover, but the name Stephen was dropped early in life. The family removed to Fayetteville, N. Y., in 1841, and in 1850 to Clinton, and Grover was educated in the Fayetteville schools and at Clinton Academy, where he was preparing for college when his father's death in 1853 necessitated his going to work to assist in the support of his mother and sisters. For a year he taught in the Institution for the Blind in New York and then, deciding that a wider career was open in the West, he borrowed \$25 and started for Cleveland, O. An uncle persuaded him to settle in Buffalo, and he was admitted to practise law there in 1859.

He became interested in politics as a Democrat, and in 1863 became assistant district attorney of Erie county and in 1870 was elected sheriff, in which office he served for three years. Meanwhile he had become known as a successful lawyer and the firm of Cleveland and Bissell, formed by him and Wilson S. Bissell, afterward his postmaster-general, held a high position at the Buffalo bar. The corruption and extravagance which marked the political life of the period was awakening throughout the nation a movement for reform and economy in the conduct of public affairs, which was destined to find its leader in Cleveland. The corrupt rule of the Republican ring in Buffalo, caused a strong independent movement to be started there in 1881. Cleveland was persuaded to accept the Democratic nomination for mayor and was elected. He made a record for efficiency and strength of character in this office which attracted the attention of thoughtful people throughout the country and caused the Democratic leaders in the State to see in him a strong candidate for higher honors. He was nominated for governor in 1882, and was elected by a plurality of 192,854 over Charles J. Folger. His unprecedented victory was largely due to a factional division in the Republican organization and the belief that Folger's nomination had been obtained by fraud.

His career as governor was marked by the same independence and fidelity to his convic-

tions which he had shown as mayor of Buffalo. He kept a watchful eye on expenditures and made such a liberal use of the veto power that he became known as the "veto governor." His disregard of public clamor was well exemplified when he vetoed the bill providing for a five-cent fare on the New York elevated railroads. Meanwhile his reputation as a reformer had attracted the attention of party leaders all over the country and his availability as a presidential candidate was widely discussed. In the Democratic National Convention at Chicago in 1884 he received the nomination on the first formal ballot. His Republican opponent, James G. Blaine, had alienated the support of many Republicans interested in reform and a vigorous revolt, the "Mugwump" movement, in Cleveland's favor resulted. The campaign was one of bitter personalities and the contest so close that a plurality for Cleveland of less than 1,500 in New York decided the result. The electoral vote stood 219 to 182. His independent supporters were strong friends of civil service reform and one of his first difficulties after taking office, Mar. 4, 1885, was in reconciling the principles of reform in the civil service with the claims of his party supporters. His use of the appointing power satisfied neither but, on the whole, marked a great advance towards a non-partisan civil service.

Among the important features of his first administration were his unprecedented use of the veto power (he vetoed 297 pension bills alone), and his commitment of his party to the policy of tariff reform. He took the matter up in his first message to Congress and his annual message in 1887 was entirely devoted to that subject. The latter, coming just before the presidential election, aroused intense interest. It had the effect of uniting the party in opposition to the protective system, and furnished the principal issue of the ensuing campaign in which Cleveland was defeated by Benjamin Harrison by an electoral vote of 233 to 168. In the session following the election, the Democrats succeeded in getting a tariff reform bill (the "Mills" bill) through the House of Representatives, but it was killed in the Senate, where there was a Republican majority. After the expiration of his term Mr. Cleveland resumed the practice of law, this time in New York City. He married at the White House on June 2, 1886, Miss Frances Folsom.

The passage by a Republican Congress in 1890 of the McKinley Tariff Bill and the overwhelming Democratic victory in the Congressional elections of that year upon that issue, made Cleveland the logical Democratic candidate in 1892. He was nominated on the first ballot, by a small vote over the necessary two-thirds, in spite of the opposition of many influential men in the party, and was triumphantly elected, receiving an electoral vote of 277 to 145 for Harrison and 22 for James B. Weaver, and took office on Mar. 4, 1893. For the first time in thirty-six years, Democrats found themselves in control of the Presidency and both houses of Congress. This was largely the result of Cleveland's leadership, but the situation had many elements of danger both for Cleveland and for the party. Although he had received a plurality of 380,810 in the popular vote, over 1,000,000 votes had been cast by the People's Party, which was pledged to the free coinage of silver and other radical measures. A large sec-

WAS SEVENTY YEARS OF AGE**

tion of the Democratic party, including many Senators and Representatives, also favored free silver, while Cleveland himself had courageously spoken against the movement in a letter made public in 1891. To add to his difficulties, a severe financial panic took place early in 1893, which was charged by the Republicans to the fear of further anti-tariff legislation and by many of both parties to the failure to provide for the unlimited coinage of silver.

Cleveland met the situation courageously. He recommended to a special session of Congress the repeal of the Sherman Law of 1890, and, after a bitter struggle, the repealing of the act was passed, a large part of the favorable vote in each house being Republican. The regular session of Congress beginning in Dec., 1893, took up the revision of the tariff. The "Wilson" bill was framed and met with Cleveland's approval as it passed the House, but was so mutilated in the Senate as to satisfy no one and the President allowed it to become a law without his signature. The natural result of this lack of harmony in the party and of the hard times was an overwhelming Republican victory in the congressional elections of 1894. Cleveland served out the rest of his term with little support in Congress or from the people, but he remained steadfastly faithful to his ideals, and paid no attention to criticism when convinced he was right.

President Cleveland's foreign policy was both strong and conservative. He withdrew from the Senate the treaty for Hawaiian annexation negotiated by the Harrison administration, and opposed attempts to involve the United States in the Cuban rebellion. On the other hand, when Great Britain refused to arbitrate her boundary quarrel with Venezuela, he sent a message to Congress (Dec., 1895) advocating the appointment of an American commission to fix the boundary and declaring that the Monroe Doctrine bound the United States to limit Great Britain to the true lines as found. Congress and the people upheld the President and, although war seemed for a while possible, Great Britain eventually agreed to arbitrate. Other important events of this administration were the dispatch of the Federal troops to Chicago during the railroad strike of 1894 to maintain order and protect the mails, and the private sale of \$62,000,000 in bonds in 1895 to maintain the gold reserve.

The Democratic division over free silver culminated in 1896 in a sweeping victory for its supporters in the national convention, and Cleveland refused to support Bryan in the campaign which followed. After the expiration of his term he retired to Princeton, N. J., where he lived the remainder of his life, his great services to his country being more and more appreciated by the people as they came to a juster estimate of his character and the difficulties of his position. Shortly after he became a resident of Princeton, Mr. Cleveland was chosen a trustee of Princeton University. He took an intense interest in the affairs of the university, and especially in the work of the graduate school. The Stafford Little Lectureship on Public Affairs was established for him, and he delivered a notable series of lectures, which formed, to a certain extent, a defense of his policies while he was President, including his Venezuelan policy. These were published in 1904 under the title, *Presidential Problems*. He

also wrote a volume of essays on fishing and other outdoor sports.

In 1905 Mr. Cleveland became one of the trustees in control of the majority stock of the Equitable Life Assurance Society, but aside from this his interest was centered in his home and family, and in his favorite recreations of hunting and fishing. During the campaign of 1908 a letter signed with his name and attacking the candidacy of Mr. Bryan was extensively circulated until discovered to be a forgery.

CLOUS, JOHN WALTER. An American soldier, died in New York, on Sept. 1, 1908. He was born in Germany, on June 9, 1837, and was educated for the law, but emigrated to the United States in 1855 and in 1857 enlisted in the army. He was commissioned second lieutenant Dec. 2, 1862, for conduct under fire, and at the close of the Civil War was a first lieutenant in the Sixth Infantry, having been twice brevetted for gallantry at Gettysburg. He continued his legal studies while in the army, was admitted to the bar, and became a recognized authority on military law. In 1886 he was made major and judge-advocate and continued in that department of the army until his retirement in 1901, as judge-advocate-general. During the Spanish War, he was made brigadier-general of the volunteers. He served on the staff of General Miles during the Porto Rico campaign, and was a member of the Cuban evacuation commission.

COAL. In 1907 the production of coal in the United States reached the unprecedented total of 480,363,424 short tons, of which 394,759,112 short tons were bituminous coal and lignite and 85,604,312 short tons were Pennsylvania anthracite. In 1908, as a result of the panic of the previous year and the financial and business depression, there was a greatly decreased production amounting to 15 to 20 per cent. In the more important fields of Michigan, New Mexico, Oklahoma, Washington, and Utah, the output of 1908 was almost equalled or in a few cases exceeded, but in Pennsylvania and West Virginia the falling off was very marked. Illinois after Pennsylvania ranks as the largest producer in the United States, and is followed by West Virginia, and Ohio in the order named. Estimates made by the United States Geological Survey indicated that the bituminous coal production in 1908 was between 320,000,000 and 330,000,000 tons, or practically 70,000,000 tons less than in 1907.

The railroad shipments of anthracite in 1908 amounted to 64,237,076 long tons, or 71,945,525 short tons, as compared with 67,109,393 long tons, or 75,162,510 short tons, in 1907, indicating a decrease in the shipments of this product, which, except for the smallest sizes is now used almost exclusively for domestic purposes, and in the Eastern and Middle States, of 2,872,317 long tons, or 3,217,005 short tons. This would indicate a decrease in the total production of anthracite of 3,580,000 short tons. In somewhat more detail are the statistics from the annual review of *The Engineering and Mining Journal* (New York, Jan. 9, 1909) which gives the production by States, based on the best available returns and estimates. With these figures are included those for 1907, compiled by the same authority, which, however, shows a slight discrepancy from the estimates and more extended table of the U. S. Geological Survey.

West Virginia	47,205,965	44,091,000
Wyoming	6,218,859	6,100,000
Total bituminous ..	388,222,868	338,688,000
Anthracite:		
Colorado	45,113	30,000
New Mexico	17,000	10,000
Pennsylvania	86,279,719	80,240,000
Total anthracite ..	86,341,832	80,280,000
Grand total	474,564,700	418,968,000

(a) For the fiscal year ending June 30.

(b) For the 12 months ending November 30, 1907.

(c) As reported by the U. S. Geological Survey.

In the bituminous regions the effects of the panic were most seriously felt in the coking branch of the coal-mining industry, the Connells-ville and the Lower Connells-ville districts of Pennsylvania, the principal coke-producing centres, reporting a decrease in output amounting to nearly 50 per cent. See COKE.

In Utah, where the smallest percentage of decrease in coal production was reported, namely, 6 per cent., the production of coke decreased about 60 per cent. The largest percentage of decrease is reported from the southwestern counties of Virginia, where the production in 1908 is estimated at 60 per cent. of that of 1907, all of the decrease being attributed directly to the effects of the panic. The next largest percentage of decrease was reported from Michigan, where the production is stated to have fallen off between 25 and 35 per cent., largely as the result of slackened demand in the manufacturing cities along the Lake front, a slackening due directly to the panic. In the Southwestern States—Kansas, Oklahoma, Arkansas, and Texas—the coal production was influenced less by the financial conditions than by the competition of coal with fuel oil and natural gas, which

has developed through the bringing in of the mid-continent and Louisiana fields, in addition to the already developed Beaumont district.

A short cotton crop and a consequently lessened demand from ginning establishments, and a period of idleness from Apr. 1 to June 15, pending a settlement of the wage scale, also adversely affected coal production in these States. Conditions in the later months of the year showed some improvement as compared with those in the first part, but at no time was there any excess of demand over supply. In the States of the Middle West, operations were for a time suspended, pending an adjustment of the wage agreement; elsewhere there were no serious troubles from strikes or lockouts. The labor supply was usually abundant, and transportation facilities were adequate for the requirements.

Exports of coal and coke from the United States for the year ending Dec. 31, in long tons, were as follows:

	1907	1908	Changes.
Anthracite...	2,698,072	2,752,385	I. 54,286
Bituminous	10,454,677	9,100,819	D. 1,353,858

Total Coal...	13,152,749	11,853,177	D. 1,299,572
Coke	874,689	622,228	D. 252,461

Canada took in 1908, a total of 9,252,943 tons of coal. The decrease in coal in 1908 was 9.9 per cent.; in coke, 28.9 per cent. Imports of fuel into the United States, year ending Dec. 31, in long tons, were as follows:

	1907	1908	Changes.
Anthracite.....	9,896	16,483	I. 6,587
Bituminous ...	2,116,122	1,487,816	D. 629,006

Total coal...	2,126,018	1,504,299	D. 622,419
Coke	132,536	129,591	D. 2,945

Imports of coal were mainly on the Pacific Coast. Canada furnished 1,107,737 tons of coal and nearly all the coke in 1908; Australia, 327,441 tons of coal. The decrease in coal in 1908 was 29.3 per cent.; in coke, 2.2 per cent.

The coal mining industry during the year 1908 was marked by few labor disturbances, as in most States the general business conditions were such that the mine workers were only too glad to remain at work on terms previously arranged. In Alabama, from July to September, there was a strike carried on by the United Mine Workers of America. (See STRIKES AND LOCKOUTS; ALABAMA.) In Illinois during April and May, work was suspended while miners and operators endeavored to reach an agreement, and in Wyoming an unsuccessful attempt made by the operators to reduce wages from a scale adopted during the more prosperous times of 1907 resulted in a brief period of idleness, after which work was resumed at the old rate. In Pennsylvania an agreement for the mining scale for two years from April 1, 1908, to April 1, 1910, was reached by miners and operators, and assisted materially in establishing more stable conditions in the industry.

During the early part of the year much interest was manifested in the probable effect of the Hepburn law which became operative on May 1, 1908, as in the event of the enforcement of this measure, which prohibited the transportation of coal between States by railroads directly or indirectly interested, many of the larger companies, both anthracite and bituminous, would have been compelled to reorganize independently of railroad control. A test

case to determine the validity of the law was argued early in the year and a decision in favor of the railroads was given by the court. An appeal to the U. S. Supreme Court was taken by the government, but up to the end of the year no decision had been rendered. See RAILROADS.

The subject of the prevention of mine accidents attracted an unusual amount of attention during the year, as the problem was approached from several sides, all concerned anxious to diminish the risks in coal mining so often resulting in fatal disasters. On the part of the mine owners, in addition to studying every technical method available for the prevention of explosions and other catastrophes, it was determined that miners should receive a higher grade of instruction in the fundamental and elementary problems of coal mining. Certain of the larger companies established night schools for the instruction of the miners without cost, and these were availed of by the operatives. It was also proposed that miners should serve an apprenticeship before being permitted to work on their own responsibility, as one careless or indifferent miner often could endanger the lives of many of his fellows, not to mention the property of the owners. A demand was also made for higher qualifications on the part of mine foremen and mine fire-bosses who must be duly licensed.

The question of mine accidents continued to receive the attention of the U. S. Geological Survey and in accordance with the terms of an Act of Congress appropriating \$150,000 for the investigation of mine disasters, it was determined to establish rescue and experiment stations, each in charge of a government engineer, where oxygen helmets and other appliances, the advantage of whose use was demonstrated beyond question in several serious mine accidents during this and previous years, will be available for rescue work. The intention was to train rescue crews for the different mines, and to teach the use of the best and most approved apparatus, rather than for the government stations to carry on general rescue work. At each of the stations

there were to be provided air-tight rooms where gas could be introduced and the behavior of lamps and rescue apparatus studied by the miners under the most practical conditions.

The location of stations, so far as determined on during the year, was as follows: At Urbana, Ill., in connection with the University of Illinois, for a district including Illinois, Indiana, Michigan, Iowa, northern Missouri and western Kentucky; at Raton, New Mexico, for a district including New Mexico, Colorado, Wyoming, and Montana, with a second station possibly at Salt Lake City, Utah; at or near South McAlester, Oklahoma, for a district including Oklahoma, Arkansas, and southwestern Missouri; at an undetermined point (perhaps Knoxville, Tenn., Birmingham, Ala., or Lexington, Ky.) for a district including Alabama, Tennessee, Virginia, eastern Kentucky, Georgia, and southern West Virginia.

These stations were designed to serve a further purpose in that they would be headquarters for the Geological Survey engineers engaged in the study of the waste and other problems in coal mining.

The government in common with the manufacturers of explosives during the year devoted considerable attention to the subject of blasting powder used in mines, and the technologic branch of the U. S. Geological Survey opened at Pittsburg, on Dec. 3, in the grounds of the U. S. Arsenal, an experiment station where elaborate apparatus was assembled for the investigation of mine explosives. There are gas and dust galleries of boiler plate steel, one of which is 100 feet in length by 6 feet 4 inches in diameter, where actual explosions can take place. At this station the aim was to ascertain the correct kind of powder to use in various kinds of mining with due regard to safety and efficiency. The blasting, or shot-firing, as it is termed, is a prolific source of accidents in coal mining, especially in the bituminous mines, and while in many cases the miner is negligent, in others, either the system or the material used may be responsible. It was proposed that the

Mineral Industry, Vol. XVI.

TESTING PLANT OF THE TECHNOLOGIC DIVISION

OF THE UNITED STATES GEOLOGICAL SURVEY AT PITTSBURG ARSENAL, PITTSBURG, PA.

1. General view of Explosives Chamber where explosives are tested in the presence of fire damp and cold dust.
2. View of Explosives Chamber taken fifteen seconds after explosion ; demonstrating that coal dust is explosive.
3. Members of Government Rescue Corps equipped to enter mine where disaster has taken place, showing oxygen tanks and other appliances.

shot-firing should be done by a special corps of employees at the close of the days' work, as is successfully done in certain mines both in Europe and America, but this is opposed on the score of economy, and was considered to be not without dangers of its own. The proper discipline of a mine must be maintained under all hazards, as a model mine under lax conditions can be quite as dangerous as one ill equipped and poorly conducted. This was shown in the disaster in the Marianna mine of the Pittsburg-Buffalo Co., at West Bethlehem, Pa., Nov. 28, 1908, where the use of black powder and the violation of blasting rules were deemed responsible for an explosion of gas and dust, which caused the loss of 154 lives, in what was considered a well planned and well operated mine. On Dec. 29, an explosion occurred at the Lick Branch mines in West Virginia, in which 51 miners were killed. The only other serious accident in 1908 was in January, at the Hanna mine, in Wyoming, where 70 men lost their lives. On the whole, the record for the year 1908 as regards the number of deaths in the coal mines, was much more favorable than in 1907, and the aggregate mortality was several hundred less than in that year. According to the estimates of the U. S. Geological Survey in 1907, 3,125 men lost their lives in the coal mines of the United States, or a death rate of 4.86 to every 1,000 employed, which was three to four times that of any coal producing country of Europe. In December, 1907, four explosions caused the death of 700 men, so that when compared with the accidents mentioned above for 1908, the improvement in the latter year readily will be seen.

COCAINE HABIT. The use of cocaine as a vice did not diminish, and the wide spread of the practice caused the enactment of strict regulations for the sale and distribution of the drug in many cities and States. In New York City the first conviction, on May 14, 1908, under the new law, resulted in the sentence of the offender, a Mott street druggist, to the maximum penalty of one year in prison and a fine of \$1,000. Arrests and convictions were reported from several States. New York, Baltimore, Chicago, and Boston were all most active in the crusade. Gordon, of Philadelphia, has made studies of the acute and chronic intoxications of cocaine and opium. He reported 15 cases of acute and 10 of chronic cocaine poisoning. Two of the acute cases who had taken the drug with suicidal intent, died. Cocaine is a powerful cerebral and spinal poison, and gives rise to a great variety of nervous and mental symptoms. In the chronic cases reported it was noteworthy that in six out of the ten the habit was acquired while under treatment for nasal affections. Besides various delusions there is a gradual and progressive loss of intellectual force and moral sense. See "Insanities Caused by Acute and Chronic Intoxications with Opium and Cocaine," by Alfred Gordon, M. D., in the *Jour. Am. Med. Asso.*, Vol. LI., p. 97.

COCHIN-CHINA. A French colony in Indo-China. Area, about 21,900 square miles; population (1906), 2,834,667, including 230,000 Cambodians, 100,000 Chinese, and 5500 Europeans. There are about 1,700,000 Buddhists and 50,000 Roman Catholics. Saigon, the capital and principal port, has about 51,000 inhabitants; Cholon, the largest city, 173,000. Of the 1,-

522,666 hectares (1 hectare = 2.47 acres) under cultivation, rice takes up 1,358,706. Other crops are maize, beans, sweet potatoes, betelnuts, oranges, bananas, sugar-cane, coffee, tobacco, cotton, pepper, cocoanuts, earth-nuts, etc. The cultivation of the ylang-ylang tree, famous for its yield of perfumery essences, has been successfully introduced on several estates. Forests cover 1,748,700 hectares. Extensive irrigation and drainage works are being carried out in the central and southwestern provinces. In some of the larger towns there are rice and saw mills, soap and varnish factories, etc. Coal is mined, and the fisheries are extensive. There are few good roads, but the numerous rivers and canals are navigated by thousands of boats. The imports and exports are included in those of French Indo-China (q. v.). The export of rice through the port of Saigon in 1907 was 1,052,944 metric tons. The colony is administered by a lieutenant-governor, assisted by a privy council and a colonial council; the latter contains several natives.

COCOS, or KEELING ISLANDS. A group of small coral islands in the Indian Ocean, attached to the Straits Settlements (q. v.) and incorporated with Singapore. In 1904 there were 640 inhabitants, mostly Malays. Cocanuts and cocoanut oil are produced. The export of copra is about 800 tons annually.

COFFEE. The great consumption of coffee in the United States and the possibilities for its extensive culture for the American market in its colonial possession caused coffee to be a topic of considerable discussion in 1908. Of the coffee imports into the United States, taking the fiscal year 1908 as an example, out of the 890,000,000 pounds imported, practically 700,000,000 came from Brazil, another 100,000,000 from other South American countries, 70,000,000 from Mexico and Central America, and 7,500,000 from the West Indies, the remainder coming from parts of the world other than America. Of this remainder, 9,000,000 pounds came direct from the East Indies, 2,000,000 from Netherlands, presumably brought from her East Indian possessions, 4,000,000 from Asia and Oceania, other than the East Indies, and about another 1,000,000 pounds from United Kingdom, Germany, and other European countries, presumably the product of their tropical colonies. Thus America supplies practically 98 per cent. of the coffee imported into the United States.

In addition to imports from foreign countries, small quantities, especially of coffee, were being brought into the United States from its own islands. From Hawaii, in which the production of coffee is a comparatively new industry, the quantity of the coffee brought into the United States in the fiscal year 1908 was 1,310,000 pounds. From Porto Rico, in which the coffee industry is well established, but which sells its coffee chiefly to European countries, the quantity brought into the United States during the year mentioned was but 129,000 pounds—Porto Rico's exportation of coffee to foreign countries in the fiscal year 1908 having amounted to about 35,000,000 pounds. From the Philippines the quantity brought to the United States has been very small, in many years none. The coffee industry in those islands, which was formerly very prosperous, has in recent years suffered to such extent from

a blight that exportations from the islands have practically ceased, though the fact that similar conditions which overtook the coffee industry in the Dutch East Indies were successfully combated and the production and exportation of coffee shortly resumed, suggested that the Philippines, with proper attention, again might become large producers and exporters of coffee.

The United States is the world's largest consumer of coffee. Coffee importations by the principal countries of the world in 1906, amounted, according to a statement of the Department of Agriculture, to 2,577,000 pounds, of which 985,000,000 were imported by the United States, 412,000,000 by Germany, 256,000,000 by Netherlands, 216,000,000 by France, 119,000,000 by Belgium, and 113,000,000 by Austria-Hungary, while in no other country does the total reach as much as 100,000,000 pounds.

In 1888, the quantity of coffee imported was 423,000,000 pounds, and in 1908, 890,000,000 pounds, though the quantity has fluctuated from year to year. The per capita consumption, which in 1868 was 6.52 pounds, in 1878, 6.24, and in 1888, 6.81, was in 1898, 11.68 pounds, and in 1908, 10.04 pounds. See BRAZIL, section on *Agriculture*.

COGHLAN, JOSEPH BULLOCK. An American naval officer, died at New Rochelle, N. Y., on Dec. 5, 1908. He was born in Frankfort, Ky., on Dec. 9, 1844, and graduated from the United States Naval Academy at Annapolis in 1863. He saw service during the Civil War on the *Sacramento*; became lieutenant in 1866, lieutenant-commander in 1868, commander in 1882, captain in 1896, and rear-admiral in 1902. He commanded the *Raleigh* in the battle of Manila Bay (May 1, 1898), and

afterwards destroyed the batteries at the entrance of the bay and captured the *Isla Grande* in Subig Bay. He was commandant of the Brooklyn Navy Yard from 1904 to 1907, although placed on the retired list in Dec., 1906. Admiral Coghlan's frankness and manner of speaking his mind, while making him one of the most popular officers in the navy, got him into trouble with the Navy Department on several occasions. His recitation of the "Hoch der Kaiser" doggerel at the Union League Club, New York, (Aug. 19, 1899), on his return from the Philippines, cost him a reprimand, while in 1876 he had been court-martialed and lost thirteen numbers in grade because of a letter written by him to the department. He was advanced five numbers in rank for his services at Manila and later had his thirteen numbers restored to him.

COGSWELL, JAMES KELSEY. An American naval officer, died at Jacksonville, Fla., on Aug. 12, 1908. He was born on Sept. 27, 1847, at Milwaukee, Wis., and entered the Naval Academy in 1863. He gained his commission as ensign in 1869, was advanced to master in 1870, lieutenant in 1874, and after twenty-one years' service in that grade became a lieutenant-commander in 1895. The outbreak of the Spanish War found him executive officer of the battleship *Oregon*, on the Pacific coast, and he participated in the voyage around South America and in the battle of Santiago on that ship, being advanced five numbers in grade for his services. He became commander in 1899, captain in 1904, and retired the same year, with the rank of rear-admiral.

COINS, FOREIGN, VALUE OF. The accompanying table indicates the values of foreign coins in United States money on Jan. 1, 1909:

COUNTRY	Standard	Monetary unit	Value in terms of U. S. gold dollar	Coins
Argentine Republic..	Gold.....	Peso.....	\$0.965	Gold: argentine (\$4.824) and ½ argentine. Silver: peso and divisions.
Austria-Hungary.....	Gold.....	Crown.....	.203	Gold: 10 and 20 crowns. Silver: 1 and 5 crowns.
Belgium.....	Gold.....	Franc.....	.193	Gold: 10 and 20 francs. Silver: 5 francs.
Bolivia.....	Silver.....	Boliviano.....	.365	Silver boliviano and divisions.
Brazil.....	Gold.....	Milreis.....	.546	Gold: 5, 10, and 20 milreis. Silver: ½, 1, and 2 milreis.
British Possessions, N. A. (except Newfoundland).	Gold.....	Dollar.....	1.000	
Central Amer. States—Costa Rica.....	Gold.....	Colon.....	.465	Gold: 2, 5, 10, and 20 colons (\$9.307). Silver: 5, 10, 25, and 50 centimos.
British Honduras.....	Gold.....	Dollar.....	1.000	
Guatemala.....	Silver.....	Peso.....	.365	Silver: peso and divisions.
Honduras.....				
Nicaragua.....				
Salvador.....				
Chile.....	Gold.....	Peso.....	.365	Gold: escudo (\$1.825), doubloon (\$3.650), and condor \$(7.300). Silver: peso and divisions.
China.....	Silver....	Tael...	Amoy.....	.598
			Canton.....	.597
			Cheefoo.....	.572
			Chin Kiang.....	.584
			Fuchau.....	.553
			Halkwan.....	.609
			(Customs)	
			Hankow.....	.560
			Kiaochow.....	.580
			Nankin.....	.592
			Niuchwang.....	.561

COUNTRY	Standard	Monetary unit	Value in terms of U.S. gold dollar	Coins
China	Silver....	Tael... { Ningpo..... .575 Peking..... .583 Shanghai... .546 Swatow..... .553 Takau..... .602 Tientsin.... .580 Dollar { Hongkong.. .393 British..... .393 Mexican.... .396 1.000		
Colombia.....	Gold.....	Dollar..	1.000	Gold: condor (\$9.647) and double-condor. Silver: peso.
Denmark.....	Gold.....	Crown.....	.268	Gold: 10 and 20 crowns.
Ecuador.....	Gold.....	Sucres.....	.487	Gold: 10 sucres (\$4.8665). Silver: sucre and divisions.
Egypt.....	Gold.....	Pound (100 piasters).	4.943	Gold: pound (100 piasters), 5, 10, 20, and 50 piasters. Silver: 1, 2, 5, 10, and 20 piasters.
Finland.....	Gold.....	Mark.....	.193	Gold: 20 marks (\$3.859), 10 marks (\$1.93).
France.....	Gold.....	Franc.....	.193	Gold: 5, 10, 20, 50, and 100 francs. Silver: 5 francs.
German Empire.....	Gold.....	Mark.....	.238	Gold: 5, 10, and 20 marks.
Great Britain.....	Gold.....	Pound sterling.....	4.866½	Gold: sovereign (pound sterling) and ½ sovereign.
Greece.....	Gold.....	Drachma.....	.193	Gold: 5, 10, 20, 50, and 100 drachmas. Silver: 5 drachmas.
Haiti.....	Gold.....	Gourde.....	.965	Gold: 1, 2, 5, and 10 gourdes. Silver: gourde and divisions.
India [British].....	Gold.....	Pound sterling*.....	4.866½	Gold: sovereign (pound sterling). Silver: rupee and divisions.
Italy.....	Gold.....	Lira.....	.193	Gold: 5, 10, 20, 50, and 100 lire. Silver: 5 lire.
Japan.....	Gold.....	Yen.....	.498	Gold: 5, 10, and 20 yen. Silver: 10, 20, and 50 sen.
Liberia.....	Gold.....	Dollar.....	1.000	
Mexico.....	Gold.....	Peso †.....	.498	Gold: 5 and 10 pesos. Silver: dollar‡ or peso and divisions.
Netherlands.....	Gold.....	Florin.....	.402	Gold: 10 florins. Silver: 2½, 1 florin and divisions.
Newfoundland.....	Gold.....	Dollar.....	1.014	Gold: 2 dollars (\$2.028).
Norway.....	Gold.....	Crown.....	.268	Gold: 10 and 20 crowns.
Panama.....	Gold.....	Balboa.....	1.000	Gold: 1, 2½, 5, 10, and 20 balboas. Silver: peso and divisions.
Persia.....	Silver.....	Kran.....	.067	Gold: ½, 1, and 2 toman (\$3.409). Silver: ¼, ½, 1, 2, and 5 kran.
Peru.....	Gold.....	Libra.....	4.866½	Gold: ½ and 1 libra. Silver: sol and divisions.
Philippine Islands...	Gold.....	Peso.....	.500	Silver peso: 10, 20, and 50 centavos.
Portugal.....	Gold.....	Milreis.....	1.080	Gold: 1, 2, 5, and 10 milreis.
Russia.....	Gold.....	Ruble.....	.515	Gold: 5, 7½, 10, and 15 rubles. Silver: 5, 10, 15, 20, 25, 50 and 100 copeks.
Spain.....	Gold.....	Peseta.....	.193	Gold: 35 pesetas. Silver: 5 pesetas.
Straits Settlements...	Gold.....	Pound sterling \$....	4.866½	Gold: sovereign (pound sterling). Silver: dollar and divisions.
Sweden.....	Gold.....	Crown.....	.268	Gold: 10 and 20 crowns.
Switzerland.....	Gold.....	Franc.....	.193	Gold: 5, 10, 20, 50, and 100 francs. Silver: 5 francs.
Turkey.....	Gold.....	Piaster.....	.044	Gold: 25, 50, 100, 250, and 500 piasters.
Uruguay.....	Gold.....	Peso.....	1.034	Gold: peso. Silver: peso and divisions.
Venezuela.....	Gold.....	Bolivar.....	.193	Gold: 5, 10, 20, 50, and 100 bolivars. Silver: 5 bolivars.

NOTE.—The coins of silver standard countries are valued by their pure silver contents, at the average market price of silver for the three months preceding the date of this circular.

* The sovereign is the standard coin of India, but the rupee (\$0.3244 1-3) is the current coin, valued at 15 to the sovereign.

† Seventy-five centigrams fine gold.

‡ Value in Mexico, \$0.498.

§ The current coin of the Straits Settlements is the silver dollar issued on government account and which has been given a tentative value of \$0.567758 1-3.

COKE. It was estimated by the United States Geological Survey that the decrease in coke production in 1908 was much larger than the decrease in the output of coal, for the production of coke in Pennsylvania in 1908 did not exceed 60 per cent. of that of the preceding year, with values showing a still larger decrease. The decrease in the production of coke in the Connellsville and the lower Connellsville districts—the principal coke-producing regions of the State—was estimated to amount to somewhat over 9,400,000 tons, as compared with

1907. In that year the production of the Connellsville district alone was 13,089,427 short tons, and that of the lower Connellsville district was 6,310,900 tons, making a total for the two districts of 19,400,327 short tons.

The accompanying table from the *Engineering and Mining Journal* gives the production of coke in the United States for 1907 and 1908.

PRODUCTION OF COKE IN THE UNITED STATES

(*Engineering and Mining Journal*)

States	1907 Short tons	1908 Short tons
Alabama	3,096,722	2,800,000
Colorado	1,097,061	864,000
Georgia and North Carolina	71,460	70,000
Illinois	372,697	270,000
Kentucky	77,065	60,000
Montana	31,400	30,000
New Mexico	203,437	260,000
Ohio	310,640	250,000
Oklahoma	57,600	50,000
Pennsylvania	23,516,309	11,287,000
Tennessee	495,200	250,000
Utah	324,692	290,000
Virginia	1,622,734	1,200,000
Washington	61,400	48,000
West Virginia	4,078,222	2,978,000
Other States a.	1,650,000	2,000,000
Total	37,066,619	22,697,000

a Includes output of by-product coke for Massachusetts, Maryland, Minnesota, New York, Michigan, Wisconsin, New Jersey.

The number of coke ovens in the United States at the beginning of 1908 was 99,680, of which 3,892 were by-product ovens where gas, tar, and ammonia compounds are obtained in addition to the coke. During the year the number of retort ovens of the United-Otto type were built at Kokotto, Ohio, and a large installation of Koppers regenerative ovens for the Illinois Steel Co., at Joliet, Ill. Of the 280 of these by-product ovens to be added to the plant, two batteries of 70 each were put in operation in 1908. It would seem hard to understand the reluctance of coke manufacturers to introduce more of the by-product recovery ovens in place of the older and usual bee-hive oven, as, computing the value of the by-products on the basis of those obtained from retort ovens in 1907, \$7,548,071, the waste of by-products in the bee-hive oven amounted to over \$55,000,000.

COLLEGE OF THE CITY OF NEW YORK. See NEW YORK, COLLEGE OF THE CITY OF. **COLLEGES, AGRICULTURAL.** See AGRICULTURAL EDUCATION.

COLLINS, JOHN CHURTON. An English educator and author, died on Sept. 15, 1908. He was born in Gloucestershire, on Mar. 26, 1848, and graduated at Oxford in 1872. In 1904 he was appointed professor of English literature at Birmingham University. He was an earnest advocate of popular higher education, and was prominent in the university extension movement. He was also a Shakespearean scholar, and wrote numerous critical essays on Shakespeare and other poets. His publications include: *Sir Joshua Reynolds as a Portrait Painter* (1874); *Ephemeris Critica* (1901); and *Rousseau and Voltaire in England* (1908).

COLOMBIA. A republic of South America, covering an area variously estimated at from

438,436 to 465,700 square miles. In 1908 the population was estimated at 4,141,791. The principal cities, with their estimated populations, are: Bogotá, the capital, 100,000; Medellín, 54,000; Barranquilla, 42,000; Bucaramanga, 25,000; Manizales, 24,700; Cartagena, 14,000; Zipaquirá, 12,000.

EDUCATION. Primary education is free, but not compulsory, and is largely maintained by the state. There are several colleges and normal schools, a school of mining at Zipaquirá, a school of fine arts and a school of arts and crafts at Bogotá, etc. Nearly all schools of secondary education, though maintained or assisted by the state, are under the management of the Catholic Church. The national university at Bogotá has now only a school of medicine and natural science. Other educational institutions at Bogotá are: A national academy of music, a school of commerce, a normal school, an engineering school, an astronomical observatory, etc. The number of pupils in the public schools was 223,426 in 1907 and 236,985 in 1908.

FISHING. The marine fisheries furnish green turtles, Spanish mackerel, jewfish, red snapper, tarpon, and other valuable market fishes. The Bay of Cartagena is rich in lobsters, sponge beds, and mother-of-pearl.

MINING. The mineral wealth is great. English engineers have stated that the mineral deposits of the region of Marmoto and the Rio Sucio are richer than those of the Transvaal. The coast region, on both the Pacific and Atlantic side, is rich in coal, iron, copper, lead, cinnabar, etc. Coal and petroleum have been discovered in the region of the Gulf of Uraba, between the Atrato and Leon rivers. This is supposed to be the extension of the coal and oil belt known to reach from near Cartagena to the valley of the river Sinu. The Cartagena Oil Company, with a nominal capital of \$150,000, has been formed at Bogotá. It is to refine petroleum on the Atlantic coast, and a plant was to be installed in 1908. A large French company has been formed to operate mines in the department of Santander, and in 1908 engineers and machinery arrived. The emerald mines at Muzo, department of Boyacá, are owned by the government and worked through a Colombian company. The revenue derived from them is about \$800,000 annually. The value of the salt derived in 1907 from the government mines was \$525,620, the cost of production having been \$158,507. The exports of precious metals from the department of Antioquia through Cartagena amounted in 1907 to 2081 kilograms of gold bullion, 497 kilograms of platinum, and 4723 kilograms of silver and gold in other forms. The exports of precious metals through Barranquilla in the same year amounted to 6010 kilograms.

AGRICULTURE. The coffee production averages about 600,000 bags annually, of which about 67 per cent. is shipped to the United States. Banana culture is extending in the department of Magdalena, both Colombian and foreign capital being invested in this industry. In 1907 there were exported 1,858,970 bunches of bananas, valued at \$711,574. There has been but little increase in the output of rubber, although the plantations are extending. There are reported to be 400,000 rubber trees along the Baudo river, 200,000 trees along the Arquía, and 1,000,000 in the valley of the Sinu, but a very small number can as yet be tapped. When these trees reach

the tapping age the output will no longer depend on wild trees, which are now frequently cut down or allowed to tap so long that they die for lack of sap. Ivory nuts are exported from the basin of the Atrato, the Leon, and the region adjoining the Gulf of Uraba. In the neighborhood of Sincerin 1300 men were employed in 1908 in planting 3000 acres with cane and installing a sugar factory. The first harvest was expected to reach 12,000 metric tons, yielding 265,000 bags of sugar. At Cartagena there is a cotton factory using only native cotton, which is produced chiefly in the department of Bolivar. A new fibre was reported to have been discovered in 1908, particularly fitted for the manufacture of curtains. The agricultural census of the department of Antioquia for 1907 showed the following areas for particular crops: Coffee, 26,820 hectares; sugar cane, 33,268; maize, 178,599; rice, 3825; beans, 35,369; bananas, 21,969; potatoes, 5043; barley, 149; wheat, 1092; yucca, 21,955. There were also 115,670 hectares under rubber plants, 440,120 under grass, 1,733,095 under forest, and 4,111,322 of public lands. The total area is 6,728,296 hectares.

MANUFACTURES. At Cartagena there is a cotton factory with 6116 spindles and 104 looms. Its annual consumption is about 175,000 pounds of ginned native cotton, and its output is nearly 500,000 yards of drills. There is also a shoe factory employing 30 workers in which American machinery has recently been installed; this will increase its output to 400 pairs a day. A brick and tile factory employs 200 hands. At Medellin, a hosiery factory has been established, using American machinery and yarns. Another weaving mill was being put up which was expected to begin working towards the latter part of 1908. All machinery for the latter has come from England. A spinning mill was to be added to this establishment later. Barranquilla has quite a number of industrial establishments. A match factory, employing 40 workers, has been established at Bogotá. It is under the direction of a Danish chemist, and has proved a commercial success.

COMMERCE. In 1907, the total imports were valued at \$12,488,563, against \$9,353,345 in 1906, and the exports at \$13,791,442, against \$14,613,919 in 1906. The leading exports are gold, platinum, coffee, rubber, ivory nuts, tobacco, dividivi, ipecac, cedar, mahogany, and hides. The leading imports are flour, lard, sugar, rice, potatoes, cotton goods, and petroleum. Over one-third of the entire trade is with the United States and about one-fourth with Great Britain. About one-half the entire trade passes through the port of Barranquilla.

In Jan., 1908, the rate of exchange of paper for gold suddenly rose from the prevailing or official rate of 10,000 per cent. (i. e. 10,000 paper dollars for 100 Colombian gold dollars), and was quoted as high as 13,000 per cent. during the next few months. Merchants naturally stopped all business on credit terms, but their losses on previous sales were very large. Imports were stopped, and goods previously ordered were stored in Europe. Towards Oct., 1908, exchange had again fallen to nearly its former level, due to reduced imports, as well as to the sale of an abundant coffee crop. But trade had become unsettled and was slow to recover. On Mar. 31, 1908, President Reyes issued a decree reducing the salaries of all government employees by 15 per cent., and providing that the savings

resulting therefrom, as well as from the reduction of 20 per cent. in appropriations for government expenditure in 1908, shall constitute a reserve fund to guarantee the legal value of paper money or to secure its conversion into coin.

COMMUNICATIONS. The total length of railways open in 1908 was 461 miles, and of telegraph lines, 10,354 miles. Several wireless stations have been established, and Bogotá is now in wireless connection with Santa Marta. Railroad subsidies in 1908 amounted to \$900,000 gold.

FINANCE. For 1907, the revenue and expenditure were estimated to balance at \$15,494,583. The internal revenue in 1907 yielded \$5,706,143. The expenditure for 1908, originally fixed at \$16,244,384, was reduced in March, 1908, to \$14,237,997. The proposed budget for 1909 estimated the revenue at \$16,000,000 and the expenditure at \$14,000,000, leaving a surplus of \$2,000,000 as a guarantee of the legal value of paper money. The internal floating debt, exclusive of the paper money, amounted on June 30, 1908, to \$3,063,012 gold. The consolidated internal debt amounted at the end of 1906 to \$5,476,887 silver, and the external debt was 81,430,350 francs.

ARMY AND NAVY. The strength of the national army, in which every able-bodied citizen is liable to service, is fixed annually by act of Congress. The effective peace strength in 1908 was 5000 men, and the number available for war service was estimated at 200,000. The effective navy consisted at the beginning of 1908 of two gunboats, of 1430 tons.

GOVERNMENT. General Rafael Reyes was elected President of the Republic in 1904 for the constitutional term of four years. In 1905, his term of office was extended, by a resolution of the General Assembly, to ten years—until 1914.

HISTORY. On Oct. 24, 1907, ratifications were exchanged for the Treaty of Amity, Commerce and Navigation with Ecuador. In April, 1908, President Reyes made a tour of the country for the purpose of studying its economic conditions, and in his report urged increased cultivation of the quickly grown crops. In his message on the opening session of Congress, on July 20, 1908, he comments on the satisfactory state of affairs at home and of relations with foreign countries, and notes especially the improvement in public instruction throughout the Republic. In the report of July, 1908, by the Minister of Foreign Relations, it was announced that the legation in Washington had received instructions to incorporate in a treaty with the United States the most favorable conditions possible as to traffic through the Panama Canal. On Aug. 11, a law was promulgated doing away with the old political divisions and re-dividing the country into thirty-four Departments, each of which was to pay its revenues to the Federal treasury. This was to become operative on Jan. 1, 1909. On Aug. 21, the National Assembly ratified the Sanitary Convention, which had been concluded in Washington on Oct. 14, 1905. To carry its provisions into effect, a sanitary maritime and land police was established in the Republic, and it was provided that the president should establish the requisite sanitary stations at Cartagena and Buena Ventura. On Aug. 19 the Assembly ratified the Convention in regard to the rights of aliens, which had been concluded at the second international conference of Ameri-

can States in Mexico in 1902. Other international agreements ratified by Congress before its adjournment in August were the convention fixing the status of naturalized citizens who again took up their residence in the country of their origin; an industrial property convention between Colombia and Great Britain; a convention supplementing the boundary treaty between Colombia and Ecuador; a convention on pecuniary claims concluded at the third international conference of American States; a convention on the exchange of official publications, and treaties of commerce with Switzerland and Japan. In April, a Colombian force occupied for a short time, the town of Jurado, in Panama, because of the latter's failure to meet its financial obligations towards Colombia. At the end of the year a settlement between Colombia and Panama was near completion. In full satisfaction of her claims arising from the Panama revolution, Colombia was to receive \$2,500,000 in nine installments. On Sept. 19, occurred the death of ex-president J. M. Marroquin, under whose rule Panama seceded from Colombia.

COLORADO. One of the western States of the Western Division of the United States. Its area is 103,058 square miles of land surface, and 290 square miles of water surface, or a total of 103,948 square miles. Its population in 1900 was 539,700. According to Federal estimate of 1908, the population in that year was 640,861. The estimated population of the largest cities in 1907 was as follows: Denver, the capital, 151,920; Pueblo, 30,824; Colorado Springs, 29,338; Leadville, 13,697.

MINERAL RESOURCES. Mining is the principal industry of the State. The aggregate value of the mineral production of the State, according to figures given by the United States Geological Survey, was \$71,105,128 in 1907 as compared with \$69,834,581 in 1906. The figures for the mineral production for 1908 showed an increase in the gold production, but a decided falling off in the output of the other metals. Both placer and auriferous lode mines increased their yield. The feature of the operations of the precious metal mines of the State in 1908 was a further extension of the leasing system in the camps of Cripple Creek, Empire, Silverton, Ouray, Telluride, and Central City. Because of the low metal prices during the latter part of 1907 and throughout 1908, the operations of the silver, lead, and zinc camps were greatly curtailed. Many of the largest mines closed in 1907 and remained closed during 1908. Work was carried on at Cripple Creek during the year in proportions greatly increased over 1907. Work on the Roosevelt drainage tunnel progressed steadily throughout the year with an aggregate of 4171 feet on Dec. 1, 1908. Its completion by Jan. 1, 1910, was predicted. The production of Leadville fell off greatly during the year. Several of the largest properties were closed the entire year, but two resumed operations in Dec., 1908. The Director of the Mint estimates the gold production of the State in 1908 at \$22,811,734, as against \$20,897,600 in 1907; and the output of silver at 10,161,318 fine ounces, as against 11,495,400 in 1907. Colorado leads in the production of lead. In 1907, there were produced 48,876 short tons, valued at \$5,180,856, as compared with 50,497 tons in 1906, valued at \$5,756,058. It was estimated

that the production of coal in the State in 1908 would be 9,773,000 tons, a decrease of somewhat more than 1,000,000, as compared with 1907. The decrease was attributed mainly to financial conditions, which resulted in shutting down many of the fuel consuming industries in the State. The total number of men employed in the coal mines of the State in 1907 was 14,223 as compared with 11,368 in 1906. There were 99 men killed in the coal mines of the State in 1907. Las Animas county produces nearly one-half the total. There is practically every variety of coal, from lignite to anthracite, although the bulk of it is bituminous. The production of coke in 1907 was 1,421,579 short tons, valued at \$4,747,436. These figures include Utah, where, however, there are but two establishments. The production for 1906 was 1,455,905 tons, valued at \$4,504,748. There are sixteen establishments for the production of coke in the State. There was a remarkable increase in the production of copper in 1907 over the figures of the preceding year. In the former year there were produced 11,998,496 pounds, valued at \$2,799,699, while the production in 1906 was 7,427,253 pounds, valued at \$1,433,460. Other leading mineral products are bismuth, tungsten, petroleum, sandstone, limestone, iron (brown hematite), zinc, gypsum, and mica.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal crops in 1908 were as follows, according to figures of the United States Department of Agriculture: Corn, 2,586,000 bushels, valued at \$1,836,000, from 128,000 acres; spring wheat, 6,153,000 bushels, valued at \$5,415,000, from 293,000 acres; oats, 7,031,000 bushels, valued at \$3,797,000, from 178,000 acres; barley, 792,000 bushels, valued at \$515,000, from 24,000 acres; rye, 46,000 bushels, valued at \$32,000, from 3,000 acres; potatoes, 7,000,000 bushels, valued at \$4,250,000, from 56,000 acres; hay, 1,675,000 tons, valued at \$14,656,000, from 670,000 acres. Since 1900 there has been a substantial increase in acreage of oats and potatoes and a great decrease in the acreage of hay. The latter is the most valuable crop produced in the State. There was a slight decrease in the hay grown as compared with 1907, when the production was 1,828,000 tons. There was a large decrease also in the production of wheat, of which 8,497,000 bushels were grown in 1907. The production of oats, however, increased considerably from the crop of 1907, which was 5,890,000 bushels. The other crops show little variance from those of 1908. The State ranks first in the production of beet sugar. The yield in 1908 was estimated at 110,000 long tons. The number of farm animals on Jan. 1, 1909, was as follows: Horses, 275,000; milch cows, 158,000; other cattle, 1,454,000; sheep, 1,695,000; swine, 165,000. There has been a large increase in the last few years in the number of dairy cows and a substantial, though smaller increase in other cattle. The estimated value of the wool clip in 1908 was \$1,411,200.

MANUFACTURES. The 1905 census covering all establishments classed as factories showed a total of 1606 establishments, an average of 21,813 wage-earners and products valued at \$100,143,999. Compared with the same industries in 1900, when the similar establishments numbered 1323, there was an increase of 11.8 per cent. in

the number of wage-earners and of 12.4 per cent. in the value of products. The value of products of leading industries, exclusive of smelting and metallurgical works, in 1905, and in parentheses the increase in value since 1900, were as follows: Beet sugar, \$7,198,982; flour and grist mill products, \$5,783,421 (30 per cent.); railway shop work, \$5,259,183 (69.8 per cent.); printing and publishing, \$5,452,435 (53 per cent.); foundry and machine shop products (3 per cent.); slaughtering and meat packing (23.7 per cent. decrease); bread and bakery products (65.7 per cent.); malt liquors, \$2,120,187 (3.9 per cent.); lumber and timber products, \$1,753,791 (11 per cent.); and coke, \$1,723,276 (42 per cent.).

EDUCATION. The most important features of educational progress in the State in the last few years have been the erection of several hundred substantial school buildings, a marked increase in high school enrollment, and the introduction of manual training and domestic science into many city schools. According to the last biennial report of the State Superintendent of Public Instruction there were, in 1908, 207,573 persons in the State of school age (6 to 21). The total enrollment in public schools was 149,307 in 1907, and the average daily attendance, 101,113 in 1907. The enrollment in private schools was 3288. The number of teachers employed numbered 5000, of whom 4169 were female. The average salary of male teachers was \$93.42 in the city and \$57.75 in rural schools and of female teachers \$63.28 and \$50.95 respectively. The total expenditures for public schools in 1907 was \$4,578,852.

FINANCE. According to the biennial report of the State Treasurer, the balance in the treasury, Dec. 1, 1908, was \$2,820,269.19. The receipts for 1907-8 were \$6,852,934.21; the balance in the treasury, Dec. 1, 1906, was \$2,814,070.52; the total receipts for 1907-8 were \$9,667,004.73; the disbursements for 1907-8 were \$6,846,730.54, leaving a balance on Dec. 1, 1908, as indicated above. The floating indebtedness of the State on Nov. 30, 1908, was \$3,824,556.66. The bonded indebtedness was \$4,218,056.06, leaving the total debt, less cash in the treasury and uncollected taxes, \$1,583,137.32.

CHARITIES AND CORRECTIONS. For the support of the State Insane Asylum there was expended \$20,035.24, and for the support of the mute and blind, \$142,872.56. The receipts for penitentiary convict labor were \$57,435.44, and the disbursements, \$56,484.61, leaving a balance of \$965.06.

POLITICS AND GOVERNMENT. There was no meeting of the legislature in Colorado in 1908. A notable decision in the land fraud prosecutions, instituted by the government for the unlawful seizure of public lands, was handed down at Denver on Jan. 10, by Judge Robert E. Lewis, of the United States District Court. Certain prominent business men of Colorado had been indicted on a charge of violating the law in timber land transactions. This law was the Timber and Stone Act of 1878, which has been the instrument by which the greater part of the more valuable timber lands not now in National Forests has gone into the hands of the large timber companies. The Act provides that stone or timber lands from the public domain may be sold to American citizens, or to persons who have declared their intention to become such, in a quantity not exceeding 160 acres to any

one person or persons, at the price of \$2.50 an acre. Before formal or approved entries for this land are made, preliminary applications for entry must be filed. Prior to this, the law prohibits conspiracy under heavy penalty and requires the entryman's oath that he is not acquiring the land for another. The law, however, does not require a similar oath at the time of final entry, although the land office regulation does. The defendants were charged with having procured persons under hire, first, to make entries as individual entrymen with the local land officers operating under the General Land Office in the Department of the Interior, for tracts respectively not exceeding the quantity allowed by law; second, to pay to the local officers, with moneys furnished by certain corporations, the price of the land, as fixed by law; third, to secure titles from the government for the lands to themselves as entrymen, and finally to convey titles of the lands to the corporations involved. Judge Lewis quashed the indictment, because, according to his decision, "it begins where the timber and stone land leaves off." As the entrymen were not charged with being hired to make the preliminary applications for entry, "in the absence of any further prohibition, how can we say that it is a criminal fraud for an intending and qualified entryman in his application to contract to sell in future the lands he has made application for with an honest purpose to acquire?" This is equivalent to saying that under existing law, criminal action punishable in the United States Court is involved only if the preliminary application for entry is accompanied by a false oath. No criminal action is involved at the final entry accompanied by a false oath, for the oath is not required by law, but only by the regulation of the executive department. Judge Lewis's decision was supported by a decision of the Supreme Court in the action of the United States against Williamson.

This decision was a severe blow to the government in its prosecution of these frauds. The Department of Justice vigorously dissented from this interpretation of the law, and the case was carried to the Supreme Court. On Dec. 14, the United States Supreme Court reversed the decision of the Federal Court. The lower court, it was held, erred in dismissing the case, and under a recent statute permitting the government to appeal any case where the construction of the law is concerned, the appeal was properly before the court. The judgment of the lower court was reversed with instructions to proceed to trial. Numerous other appeals from similar decisions in the coal land fraud cases in Colorado were pending before the court at the end of the year.

CONVENTIONS AND ELECTIONS. The Republican State Convention was held at Pueblo on April 28th. The convention instructed the delegates to vote for William H. Taft. Resolutions were passed approving Roosevelt's administration. The Democratic State Convention was held at Glenwood Springs on June 16th. The ten delegates chosen were instructed to vote for W. J. Bryan, and a platform eulogizing him was passed. At an election held in Denver on May 20th, Robert W. Speer, Democrat, was re-elected mayor by about 3000 plurality over Horace Phelps, Republican, political results being decidedly mixed. Eleven Democratic aldermen were elected out of sixteen. The Republi-

cans elected a city clerk and treasurer, and had a majority in the Board of Supervisors. In the State Convention contest for nomination to the United States Senate to succeed Henry M. Teller, Charles J. Hughes, a lawyer of Denver, secured 700 of the 750 Democratic delegates, which insured his endorsement for Senator. In the election of Nov. 3, the state vote for the national ticket was as follows. Bryan, 126,772; Taft, 123,732; Chafin, 5,538; Debs, 7,960. For the State ticket, Shafroth, Democratic, received 128,898 votes, and McDonald, Republican, 118,832. The legislature chosen was Democratic, thus insuring the election of Charles J. Hughes as United States senator. The contest in the State was largely on local issues. Denver, which went Democratic by a few thousands elected a Republican sheriff, and district attorney. The State went Democratic for the first time in years.

OTHER EVENTS. Father Leo Heinrichs pastor of St. Elizabeth's Catholic Church at Denver, was shot on Feb. 23 by Giuseppe Alia, an Italian anarchist. Father Heinrichs was shot immediately after he had administered the sacrament to Alia. This murder was alleged to be one of a series projected by bodies of anarchists throughout the country. Alia was found guilty of murder on Mar. 12. On Mar. 28, Bulkeley Wells, formerly Adjutant-General of the State, who had incurred the enmity of the Western Federation of Miners by his harsh opposition measures during the labor troubles in 1904-5, narrowly escaped death in an explosion of a dynamite bomb at Telluride. The bomb was placed under General Wells's bed. The room in which he slept was wrecked and he was hurled many feet from the bed. He escaped severe injury. On April 15th, the Champion coal mine, four miles from Durango was blown up by an explosion, after the receipt of anonymous letters threatening that the mine would be blown up unless discharged miners were reinstated. One man was killed and another severely injured. The damage to the mine was about \$25,000. On Jan. 10th, a contract was signed by which 2,000 men were at once put to work to complete the Moffat Railroad to Steamboat Springs on its way to Salt Lake City. The work was finished late in December. A company was formed with D. C. Dodge, builder of the Rio Grande and Rio Grande Western Railroads, at its head, to complete this enterprise to that point, where it will stop for a year or two. The road when eventually finished will reduce by eight hours the time from Denver to the Pacific coast. It is to tap immediately the Routt county coal fields.

The Democratic National Convention, held in Denver July 9-14, was the first national convention held so far west. The city completed at a public expense of \$650,000 what is declared to be the finest and largest fireproof auditorium in which such a gathering was ever held. The auditorium is a permanent improvement to be devoted to public purposes. It seats about 12,000.

STATE OFFICERS. Governor, John H. Shafroth; Lieutenant-Governor, Stephen R. Fitzgarrald; Secretary of State, James B. Pearce; Treasurer, Wm. J. Galligan; Auditor, Roody Kenahan; Attorney-General, Jno. T. Barnett; Superintendent of Public Instruction, Katherine M. Cook—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Robert W. Steele, Dem.; Justices, John Campbell, Rep.; Luther M. Goddard, Rep.; S. M.

White, Dem.; W. A. Hill, Dem.; M. S. Bailey, Dem.; Wm. H. Gabbert, Rep.; G. W. Musser, Dem.; Clerk, H. G. Clark, Rep.

The legislature of 1909 is composed of 20 Democrats and 15 Republicans in the Senate, and 53 Democrats and 12 Republicans in the House. The State representation in Congress will be found in the article UNITED STATES, section *Congress*.

COLORED METHODISTS. The colored Methodists of the United States embraces those in direct affiliation with the Methodist Episcopal Church and those in independent denominations. There were in 1908, 20 conferences of the Methodist-affiliated with the Methodist Episcopal Church. In these conferences were 4,128 local preachers, 2,117 ministers. Conferences are found in nearly all the Southern States and in Liberia, East Central Africa and West Central Africa. The communicants numbered in 1908 about 300,000. A still larger number of Colored Methodists are included in independent denominations. Of these the most important numerically is the African Methodist Episcopal Church, which had in 1908, 850,000 communicants, 6,815 churches, and 6,070 ministers. The African Methodist Episcopal Zion Church, the second in point of numbers, included 578,310 communicants, 3,241 churches and 3,912 ministers. The African Union Methodist Protestant Church is a much smaller body, numbering 4,000 communicants, 125 churches and 200 ministers. The Colored Methodist Episcopal Church, organized by the Methodist Episcopal Church South, numbered in 1907, 220,000 communicants, 2,700 churches and 2,700 ministers. The African Methodist Episcopal Zion Church has a publishing house in Charlotte, S. C., and issues many periodicals. Under its auspices are six colleges and many minor schools.

COLUMBIA, BRITISH. See BRITISH COLUMBIA AND CANADA.

COLUMBIA, DISTRICT OF. See DISTRICT OF COLUMBIA.

COLUMBIA UNIVERSITY. An institution of higher learning in New York City, founded in 1754. The attendance in 1908-9 was 5675 (including 1532 summer session students, but excluding 2879 students in extension teaching). These students were distributed as follows: 645 in Columbia College; 467 in Barnard College; 737 non-professional graduate students; and 2691 professional students in education, applied science, medicine, law, pharmacy, and fine arts. All parts of the United States and 35 foreign countries are represented in the student body. The graduate students represent 321 other colleges and universities. During 1907-8 Columbia received money gifts of \$329,385.39. Teachers College received \$227,123.48, and Barnard College, \$521,425, a total of \$1,077,933.87. Between 1901 and 1908 the several corporations of the University received a total of \$10,286,296.58 in money gifts. The total assets in 1903 were, \$12,084,843.86 in educational equipment, and \$21,696,777.65 in endowment. The library contained 420,000 bound volumes. The total income for 1907-8 (including Barnard College, Teachers College, and the College of Pharmacy) was \$2,367,138.19. The estimated expenditure for 1908-9 was \$1,900,466.79. The increase of \$191,883.85 over the budget of 1905-6 was devoted chiefly to the increasing of salaries of the teaching staff. The teaching and administrative staff of the University numbered 670 persons. Dr.

Nicholas Murray Butler is president. At the commencement of 1908, 956 degrees and diplomas were granted.

For the past two or three years, the University has devoted itself primarily to improving the quality of instruction in all of its fifteen schools. The representative character of the University Council has been emphasized by the election of additional members by the Faculties, and its importance as a body for the consideration of the larger University problems much increased. The establishment, mainly for the benefit of the younger students, of a system of especially qualified advisers has greatly improved the student records in the undergraduate colleges. The professional schools have been strengthened, particularly along the lines of closer contact with present-day professional methods, by important additions to the teaching staff. The work of the non-professional graduate schools, which has grown with great rapidity until Columbia has now by far the greatest number of graduate students in the United States, was being consolidated under the administration of a single dean.

COMETS. See ASTRONOMY.

COMORE ISLANDS. A group of islands, midway between Madagascar and the African coast, a dependency of France. The four principal islands are Mayotte, Grande Comore, Moheli, and Anjouan. Total area, 760 square miles; population, about 85,000, mostly Mohammedans. Sugar cane, the principal product, is worked up in local sugar factories and rum distilleries. Vanilla culture has been much extended, and coffee, tea, cacao, cloves, and rubber are being introduced. In 1906, 71 pounds of cotton were produced. In 1907 the imports and exports were valued at 463,610 and 1,023,397 francs respectively, the trade with France being represented by 207,000 francs of imports and 932,000 francs of exports. The islands are under the Governor of Réunion, who appoints an Administrator for Mayotte, a Resident for Grande Comore, and a Resident for Moheli and Anjouan. Each of the islands has its own budget, the total balancing in 1907 at 629,000 francs. Grande Comore had in 1907 a debt of 844,000 francs.

CONCERTS. See MUSIC.

CONCRETE. There were few departments of structural engineering in 1908 where the use of concrete did not enter to a greater or less extent, and with the increased prices for building materials, especially wood, its use not only had become more general but an ever wider application was being found. Reinforced concrete bridges were increasing at such a rate as to arouse comment, and in the West their use to carry highways was being demanded by the farmers on the ground of decreased outlay for repairs and maintenance. The proposed Henry Hudson Memorial Bridge at Spuyten Duyvil, New York City, the plans of which were published during 1908, has a mammoth arch of 703 feet span of reinforced concrete. The use of concrete for trestle bridges or viaducts was reported both in the United States and Europe, while for small arch bridges, both for railways and highways, concrete was being preferred on the score of economy, strength and durability. On various railway lines, especially in Europe, concrete ties were being used with some success, and various forms were under test, while in the United States the Chicago and Alton had certain sections of its line laid with concrete ties

to which the rails are fastened. As wooden ties are one of the large items of expense of a railway and consume large amounts of timber annually, it was considered that every effort should be made with experiments to find a satisfactory practice that would result in a safer, more economical and more permanent roadbed. On the Philadelphia subway, an improved form of roadbed was employed, where the rails were laid on a concrete foundation formed between longitudinal channel bars. Nor was the use of concrete confined to the roadbed. In an all-steel sleeping car, constructed for the Pullman Company, a concrete floor was used, so that with the single exception of the upholstery the car was entirely incombustible. In 1907, a concrete barge of 150 tons burden, constructed by Signori Gabilleni of Rome, was used on the Tiber and aroused considerable interest. Though heralded as a pioneer, it was found that concrete for boats had been used before both in America and Europe, but it gave rise to a movement for the further application of the idea. Engineers were engaged on the design of barges with a carrying capacity up to 300 tons, for use on the Mississippi and Missouri Rivers. In Italy, some tests were made by the government including a collision between steel and concrete barges in which the latter was the least damaged, and it was stated that the navy was considering the armoring of war vessels with concrete. In actual use, however, in ore carrying vessels on the American Great Lakes were bottoms of concrete in place of wood and they were found eminently satisfactory as they were less injured by the edges of the ore buckets used in unloading the cargo, as well as by the water ballast with which the holds were filled on the return trip up the lakes.

The use of concrete in building operations showed no decrease either in amount or variety. (See ARCHITECTURE.) Several severe fire tests occurred and were successfully met. In one instance a candy factory filled with inflammable material was threatened, but the fire was confined without difficulty to the floor on which it originated. Indeed for factory or warehouse construction reinforced concrete in 1908 seemed to be the favorite material, and many improvements were made by architects and builders in adapting construction to specific purposes. For dwellings and domestic purposes concrete and concrete blocks made headway. Users of concrete demanded that architects should look upon concrete as an original material, and that designs where it was used should take this fact into consideration and not attempt to imitate the treatment of other materials, save of course in cases where concrete was used frankly as imitation stone. Concrete in farm buildings and their adjuncts also attracted much attention and it was found that comfortable, durable and economical buildings could be erected in this way, while for fences, roads and walls as well as for ice houses and refrigerators it possessed numerous advantages. In fact at the stock yards at Chicago not only drinking troughs for the animals, but fences and pens were being made of concrete. Concrete piles continued to be used increasingly in building operations, and improved methods for their formation were being employed. In short, almost everywhere that timber has been used concrete was ready to take its place, and the matter was of importance in view of the denudation of the forests of the United

States, and the great annual loss of life and property by fire, both of which the more general use of concrete would obviate. With the rapid growth of the use of concrete it was but natural to find some instances of the failure of structures, and it was believed to be necessary that adequate knowledge and care should be observed in forming any structure of concrete. A joint committee of American engineers and cement makers and users during 1908 compiled a preliminary report on concrete and reinforced concrete, which was to be submitted to the leading engineering societies and others concerned. This contained rules for the use of the material and aimed to improve and standardize American practice. An International Commission on Concrete met at Bale, Switzerland, in October to make arrangements for the collection of data regarding the use of concrete in various countries, and particularly for the summarizing of the tests and other work of various national laboratories and associations, and for the study of reinforced concrete, taking up the matter along international lines. Its object was not only to endeavor to ascertain and explain differences of opinion and practice but to evolve standards for future tests. See CEMENT.

CONDUITS. The concrete conduit which is used to supply the Spieze hydraulic generating station at Berne, Switzerland, is rectangular in section, being 75 in. by 79 in., in inside dimensions, with 6 in. reinforced concrete walls, and expansion joints. It is carried across the Kander River on a stone arch, and at every 120 ft. in its length has a 6 in. expansion joint. The ends of the abutting portions are faced with 6 in. channels, bolted to the concrete, while a 1/32 in. band of copper, which encircles the expansion space, laps inside the inner flange of the channels, and is fastened to them. Between the copper and the channels is a rubber sheet to prevent the leakage of water which flows under a head of 2½ to 5½ feet. A very long conduit consisting of a 160 mile line, largely of wooden pipe, for the distribution of water along the El Paso & Southern Ry., has recently been installed in New Mexico. The line extends from Carrizozo, New Mexico, 144 miles from El Paso, northeast to Santa Rosa, New Mexico. The pipe has sections varying from 7½ to 16 in. in diameter and is made of Canadian white pine. See WATER SUPPLY.

CONGESTION OF POPULATION. See POPULATION, CONGESTION OF.

CONGO FREE STATE. Formerly an independent State in Africa, under the sovereignty of the King of Belgium, now annexed to Belgium by the Treaty of Oct. 15, 1908 (see *History* below, and also BELGIUM). Area, about 920,000 square miles; population, about 15,500,000. The number of whites on Jan. 1, 1908, was 2943 (1713 Belgians). The capital is Boma, on the Congo River, with about 3300 inhabitants (over 300 whites). Matadi, further inland, on the south bank of the Congo, has 4000 inhabitants (250 whites). The principal port is Banana, at the mouth of the Congo. The soil of the country is divided into native lands, private estates owned by non-natives, and Crown lands. The chief products are rubber, ivory, palm-nuts, palm-oil, coffee, cacao, tobacco, bananas, beans, and some European grains. The exports of rubber in 1904, 1905, and 1906 were 4830, 4861, and 4848 tons respectively. Elephants are

numerous, but their slaughter is now prohibited, and ivory exports are chiefly from earlier accumulations by the natives. At Api, in the Welle district, is an elephant farm with 25 animals. In 1907 the cotton production was 1475 pounds, against 445 in 1906. Iron occurs in many places. Katanga, in the southeast, is the richest mineral-bearing region in the State, containing gold and copper deposits; the latter are believed to be among the richest on the globe. The imports and exports (special trade) in 1907 amounted to 25,182,000 and 58,895,000 francs respectively. The imports are mainly textiles, foods, beverages, machinery, and metal manufactures. The principal exports in 1907 were: Rubber, 43,983,000 francs; ivory, 6,415,000; palm-nuts, 2,089,000; palm-oil, 1,508,000; white copal, 2,038,000; gold, 1,571,000; cacao, 1,053,000. Imports from Belgium in 1907 amounted to 18,026,000 francs; exports to Belgium, 53,824,000. The trade with Great Britain consisted of 2,941,000 francs of imports and 647,000 francs of exports; with Germany, 1,096,000 and 245,000 respectively; France, 849,000 and 38,000; Netherlands, 540,000 and 512,000. The ports of Banana and Boma were visited in 1907 by 578 ships of 547,388 tons. The coasting trade is largely in Dutch vessels. The length of railways is 428 miles. A railway 900 miles long is being constructed to lakes Tanganyika and Albert Nyanza. There is a government steamer service on the Upper Congo. In 1908 negotiations were completed for the construction by the British South Africa Company of a railway from Broken Hill, in Rhodesia, to Mabaya, on the Congo frontier, whence the railroad company of the Lower Congo and Katanga (Belgian) is to continue the line to the Etoile de Congo copper mine, 60 miles, and thence through Kambowe to the copper district of Ruwe, 170 miles further. Meanwhile the railroad company of the Great Lakes is laying tracks around the stretches of rapids in the Congo and placing steamers on the navigable reaches above them. When these two transportation systems will meet in the Ruwe district there will be steam inland communication from Cape Town to the mouth of the Congo.

According to the constitution for the Congo Free State adopted by the Belgian Chamber in August, 1908, the legislative power is exercised by the King through decrees proposed by the Colonial Minister, who is responsible to the Belgian Parliament. (See BELGIUM, *History*.) A Governor-General is at the head of the administration at Boma. The revenue and expenditure for 1906 amounted to 34,623,782 and 28,847,280 francs respectively. For 1908 they were estimated at 35,378,000 and 39,984,923 francs respectively. The revenue largely consists of payments in kind. The public debt in 1906 amounted to 77,432,200 francs.

ARMY, NAVY, ETC. The native armed force consisted in 1908 of about 15,000 men commanded by Belgian officers, including 18 majors, 33 captains, 144 lieutenants and 243 non-commissioned officers. Recruitment is by conscription, the annual contingent being about 3030 men. The term of service is seven years, of which five are spent in the ranks and two in the reserve. Recruits receive their preliminary training in camps of instruction before being drafted into companies. The entire force is organized as independent companies of infantry. There is a sort of second section of the conscription which

is trained not as soldiers, but as artisans for the construction of public works; in 1907 they numbered 2550. There is a marine of 11 steamers on the Lower and 39 on the Upper Congo. The expenditures for army and marine in 1908 were fixed at 5,103,000 and 2,731,000 francs respectively. At the end of 1906 there were 155 stations and hospitals for the treatment of the sleeping sickness; in the budget of 1908, 595,000 francs were assigned to the sanitation service. The Governor-General in 1908 was General Baron Wahis.

HISTORY.

Under the International Congo Conference of 1885 at Berlin and the treaties formed with the Powers pursuant thereto, the Congo Free State secured recognition as a sovereign state under King Leopold II; its neutrality was guaranteed, and provisions were made for free trade in the Congo basin, for the suppression of the slave trade and for the protection of the natives. One of the rules laid down was that the government was required to care for the improvement of the moral and material condition of the natives. In 1889 King Leopold bequeathed all his sovereign rights in the Congo to the State of Belgium after his death, and in the following year, in return for a loan, a convention was formed between him and the Belgian government whereby Belgium gained the right to annex the Congo Free State after a period of ten years. This convention having expired, on June 3, 1901 a bill was passed reassuring Belgium's right of annexation, and, in view of her probable assumption of control, suspending the payment of interest on the moneys loaned by Belgium to the Free State. A treaty of annexation was under discussion during 1907, and in November of that year was ready for submission to Parliament. In 1908 it was the subject of long and acrimonious controversy, but finally, in August, the treaty and a colonial law arranging the basis of the new administration of the Free State were passed by Parliament. For a discussion of the history and criticism of these arrangements see *BELGIUM*, paragraphs on *History*. The present article relates only to the charges brought against the Congo administration and the attitude of King Leopold and his friends toward them.

THE CONGO SCANDALS. Grave charges began to appear in the public prints nearly fifteen years ago, when it was reported by the travelers, missionaries and government officials that the natives were cruelly treated, and deprived of their lands and means of livelihood. From 1895 these reports became more numerous and specific, and by 1897 there was already a large body of accusations in the press from a great variety of witnesses. The Congo atrocities became a common subject of discussion. Gradually it appeared that these charges pointed especially to one cause as the source of evil, namely, the exploitation of native labor in the rubber trade. Thus it seemed that the abuses were not the result of occasional and personal misconduct of the officials, but were involved in the system of administration itself. At length a vast mass of evidence having accumulated, Congo Reform Associations were formed in 1904 in Great Britain and in the United States, aiming definitely at removing the cause of the atrocities by putting an end to the system of enforced labor. The reformers urged governmental interference under the terms of the treaty

of 1885, alleging that King Leopold's administration had violated the rules for the protection and well being of the natives. Influenced by this constant criticism and especially by the appeals of the British government, King Leopold in 1904 appointed a commission of three to investigate the alleged atrocities. Its report was published in November, 1905. While it emphasized the benefits of civilization which had been conferred by King Leopold's government, it admitted in essentials the evil which the reformers had charged. In applying the principle that land not occupied at the time of the foundation of the colony should revert to the state, the administration had prevented the natives from ranging the forests and earning their living, and in fact had reduced their land to so small an area that it was impossible for them to subsist. If they left their villages they were liable to arrest. They could not dispose of the product of the soil except to the degree to which they had disposed of them before the foundation. As they had no means of paying the taxes except by labor, they were required to work for the state. Moreover the state, having no means of improving and developing by itself the vast territory, had been obliged to appeal to private enterprise, and had made concessions to foreign companies, which concessions carried with them in some instances the right to enforce the labor of the blacks. The farmers of the taxes were personally interested in the exploitation of native labor, because they themselves received a proportionate share of the returns. The administration had allowed the employment of a constabulary which aided the concessionary companies in enforcing the labor of the blacks. In the Upper Congo, says the report, the state of affairs was especially bad, owing to this irresponsible constabulary. The state labor taxes, it declared, worked great hardship.

King Leopold denied all charges of cruelty that were brought against the administration. He declared that under his government the condition of the natives had greatly improved, and he pointed to the suppression of the slave trade, of human sacrifice and of cannibalism, the introduction of railways, steamships, telegraphs and even automobiles, the checking of smallpox and the sleeping sickness, the prohibition of alcohol and the reduction of the areas of barbarism by granting monopolies to foreign companies. He appointed a commission to consider the report. In June, 1906, he decreed some reforms including the provision that natives should hold their own lands except as otherwise determined by the state, and that natives under fourteen years cannot contract for labor for more than three years of general service or two years of domestic service; and the declaration that recourse should be had to punitive expeditions only as a last resort.

The reports of British and United States consular officers in 1906 and 1907 showed that the evils sketched in the Commission's report still continued, and were in fact even worse than therein appeared: For example, the report had declared that the state labor tax required forty hours a month, whereas it was said by the United States Consul General that as the result of an investigation made into this matter under the most favorable conditions, he had found that the payment of the state tax required nineteen days and five hours each month, or practically 236 days a year. "The ordinance of July 1, 1885," said he, "declared in part that the vacant lands

were to be regarded as belonging to the state. The vacant lands were considered as all those not actually occupied or under cultivation by the natives; their proprietary rights in and over their own country were ignored." He pointed out that the state, under the guise of taxation, compelled the natives "to contribute for its benefit and that of a number of concessionary companies the natural products of these lands, consisting for the most part in rubber, ivory and gum-copal." The reports of British consuls were even more complete, and were published by the British government in official volumes. These reports formed the basis of representations on the part of the British and American governments to Belgium in 1908. See *BELGIUM*, paragraphs on *History*.

In 1907, the Congo Reform Associations in Great Britain and the United States were both active, protesting that the inhuman treatment of the natives still continued. In Great Britain much dissatisfaction was expressed with the proposals of the Belgian government for settlement, and on Nov. 7, 1907, an appeal to the nation, signed by many prominent men, was published, condemning the terms of the proposed Colonial Law as leaving things practically as they had been before. In 1908 the reformers both in Great Britain and the United States complained that the arrangements concluded in that year (see *BELGIUM*) did not in any way guarantee the removal of abuses. Nowhere in the Colonial Law, the Treaty of Annexation or the Additional Act, was there any clause providing for the restoration to the natives of the lands which they formerly held in common by tribal custom. Nor did these instruments abolish the labor tax. On the contrary it is expressly stated that existing requirements will be retained. Thus, the reformers argued, the new arrangement will perpetuate the worst abuses. Grants to the concessionary companies which were estimated by Sir Edward Grey to cover three-fifths of the country, were recognized under the new arrangement, and all this area would be kept out of native hands. To raise the large sums which would have to be paid by the terms of the new arrangement to Leopold and his successor, the natives would necessarily continue to be exploited. The reformers also complained that the present Congo official staff was retained under this settlement, and thus the same men who were responsible for the abuses would have charge of the execution of the reforms. The assurances of the Belgian government that it would carry out reforms after the annexation was an accomplished fact were not regarded seriously by the critics of the new arrangement. They argued that little was to be expected from the Belgian government unless direct pressure were exerted from outside, because the exploitation of native labor in the rubber industry was too profitable, and too many Belgian subjects were financially interested in Congo enterprises. Enormous profits had come from the rubber trade to Leopold and his co-partners. With the King many of Belgium's most prominent subjects were associated. Any genuine measure of reform would greatly reduce profits and injure large numbers of shareholders. Such important business interests would be damaged by any radical change that the outlook from the reformer's point of view at the close of the year seemed distinctly unfavorable to improvement.

CONGO, FRENCH. See *FRENCH CONGO*.

CONGO REFORM ASSOCIATIONS. See *CONGO FREE STATE*, section *History*.

CONGREGATIONALISM. A term applied to a body of Christian believers, the rise of whose organized church life began with the Puritan movement in England. Independent bodies have existed from the earliest times of Christianity. In the early Congregationalism of the United States, the town became a corporate body, owning property and providing for religious services. This was the parish. The church was a voluntary association of believers under a covenant of faith. The parish still exists, though chiefly in New England. The tendency is toward dissolution of the parish and the incorporation of the church. All Congregational churches now organized are incorporated. The Congregationalists in the United States constitute the eighth largest religious body, having a membership (Dec. 31, 1908) of about 722,000.

Congregationalism finds its unit in the local church. Several churches fellowship with each other in a Conference. The churches of a State are formed into an Association. The highest expression of fellowship is found in the National Council. This body meets once in three years. It is not at all legislative, though the recommendations it makes to the churches are cordially accepted and generally adopted.

The tendency of the churches appears to be in the line of a closer and more practical fellowship. The independent church is found to be a weakness in the system. At the National Council, Cleveland, O., 1907, the report of the Committee on Polity accentuated the importance of a closer federation of the churches. Several States have followed the suggestion embodied in that report. Still, respecting the autonomy of the local church, the idea obtains that there should be a more compact organization in which the various functions of church life shall be centered, on well defined purposes. This is the latest move in Congregationalism, and is likely to become popular.

The educational and missionary work of the churches is carried on under the auspices of the following societies: the American Board of Commissioners for Foreign Missions, the Congregational Home Missionary Society, the American Missionary Association, the Congregational Education Society, the Congregational Sunday School and Publishing Society, and the Congregational Board of Ministerial Aid. All these societies, except the last, which is under the control of the National Council, are representative in their constituencies, although they were at first organized as independent societies. The women of the church are well organized in foreign and home missionary work. There are smaller societies which are distinctively Congregational, such as the Boston Seamen's Friend Society. For fellowship and culture, clubs are organized. There are over fifty such bodies in the several States. Ministers find for themselves mutual help and improvement in Associations. Ministers receive license, in some States from Conferences and in others from Associations. Ordinations and installations are carried out through ecclesiastical Councils, convened by letter missive from the Church by which such services are desired.

The following summaries give the figures for Congregationalism in the United States, Jan. 1, 1908: Churches, 5,977; ministers, 5,966; members, 708,553; Sunday school scholars, 678,620;

families, 526,013. Contributed to foreign missions, \$555,200; home missions, \$511,658; American Missionary Association, \$151,902; Church Building Society, \$109,258; Education Society, \$148,728; Sunday school work, \$61,096; Ministerial Aid, \$31,535; other benevolences added, give a total of \$2,591,660; \$8,986,014 were spent in parish support. Church property (total) was estimated at \$68,776,979. The total amount of salaries paid exceeded \$4,464,128, making an average salary of \$948.

The theological seminaries are: Andover, Cambridge, Mass.; Atlanta, Ga.; Bangor, Me.; Chicago, Ill.; Hartford, Conn.; Oberlin, Ohio; Pacific, Berkeley, Cal.; Yale, New Haven, Conn. Forty colleges exist to-day which were founded by Congregationalists. A few of these colleges are unsectarian and independent, for which cause an advantage is taken of the Carnegie Foundation. These colleges enroll 33,264 students, under 1,869 instructors; include 1,597,183 volumes in their libraries; and hold productive funds to the amount of \$26,738,894.75. The next session of the National Council will be held in Boston, Mass., Oct., 1909. The officers are: Hon. Thomas C. MacMillan, Chicago, Ill., Moderator; Rev. Asher Anderson, D.D., Boston, Mass., Secretary; Rev. Joel S. Ives, Hartford, Conn., Registrar and Treasurer.

CONGREGATIONAL METHODIST CHURCH. A religious denomination founded in Georgia in 1852 by persons who had withdrawn from the Methodist Episcopal Church and wished to form a church with Methodist doctrine, but giving the people a voice in their own government. The chief efforts of the denomination during 1908 were in instructing and developing those already members. A large number of new organizations were also formed and the progress made was more substantial than ever before. The Congregational Methodist Publishing House in Atlanta was organized and it has applied for a charter for a \$25,000 plant at Thomaston, Ga. The Atlanta Bible School is operating in Atlanta a Bible Training School, Interstate College and a Music Institute. The next General Conference of the church will meet at Anniston, Alabama, in Nov., 1909. The church numbered in 1908, 24,000 communicants, 425 churches and 415 ministers.

CONGRESS. See UNITED STATES.

CONGRESSIONAL LIBRARY. See LIBRARY OF CONGRESS.

CONNECTICUT. One of the States of the New England Division of the United States and one of the thirteen original States. Its land area is 4220 square miles and its water surface 145 square miles, making a total area of 4965 square miles. Its population in 1900 was 908,420, and according to the Federal estimate of 1908, the population in that year was 1,038,149. The largest cities, with their population (estimated) in 1906, were as follows: New Haven, 123,000; Hartford, the capital, 93,000; Bridgeport, 85,000.

MINERAL RESOURCES. The only important mineral product of Connecticut is building stone. There are in the State, in the northeast corner, iron deposits which have been worked in recent years but the developments are not important. The value of building stone quarried in 1907 was \$1,052,582, of which the granite quarried was valued at \$591,153 and trap rock at \$459,053. A small amount of limestone was also

produced. The granite produced in 1906 was valued at \$974,024 and the trap rock at \$411,345. The total production of building stone in that year was valued at \$1,386,540. Connecticut ranks fifteenth among the States in the production of building stone. According to figures given by the United States Geological Survey, from whose reports the statistics above are taken, the total value of the mineral production of the State in 1907 was \$3,389,519 as compared with a value in 1906 of \$6,660,288.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in 1908, according to the figures of the United States Department of Agriculture, are as follows: Corn, 2,395,000 bushels, valued at \$1,916,000 from 58,000 acres; oats, 359,000 bushels, valued at \$208,000 from 11,000 acres; rye, 85,000 bushels, valued at \$166,000 from 10,000 acres; buckwheat, 55,000 bushels, valued at \$44,000 from 3,000 acres; potatoes, 2,720,000 bushels, valued at \$2,448,000 from 34,000 acres; hay, 588,000 tons, valued at \$9,261,000 from 490,000 acres; tobacco, 23,224,320 pounds, valued at \$3,948,134 from 13,824 acres. Since 1900 there has been a noteworthy increase in the acreage of corn, potatoes and tobacco grown in the State. Only six States exceeded Connecticut in the total value of tobacco raised. The number of farm animals has remained practically constant since 1900 except for a considerable increase in the number of milch cows and sheep, the former numbering 137,000 and the latter, 34,000, Dec. 31, 1908. The estimated value of the wool clip in 1908 was \$44,660.

MANUFACTURES. Manufacturing showed a healthy growth from 1900 to 1905. A comparison of the establishments classed as factories in 1900 and in 1905 showed that in the latter year they numbered 3477, with \$373,283,580 capital, an average of 181,605 wage-earners, and products valued at \$369,082,091, these figures being increases, respectively, of 2.8 per cent., 24.8 per cent., 13.7 per cent., and 17.1 per cent. over the corresponding figures for 1900. The value of the products of leading industries in 1905 were as follows: Brass manufactures, 80 per cent. being rolled brass and copper, \$53,916,445; hardware, \$21,480,652; foundry and machine shop products, \$20,189,384; cotton goods, \$18,239,155; silk and silk goods, \$15,623,693; ammunition, \$15,394,485; rubber boots and shoes, \$12,829,346; woolen goods, \$11,166,965; rubber and elastic goods, \$8,868,353; felt hats, \$8,662,799; plated ware, \$8,125,881; cutlery and edge tools, \$6,167,852; clocks, \$6,158,034; corsets, \$5,590,637; hosiery and knit goods, \$5,371,452; musical instruments, \$5,272,835; iron and steel, \$5,150,675; and paper and wood pulp, \$5,039,147. Other industries with slightly less valuable outputs were the manufacture of electrical apparatus and supplies, printing and publishing, worsted goods, needles and pins, and hooks and eyes. A remarkable feature of Connecticut industries is the preponderance of plants owned by individuals. Thus in 1905 in twenty-one selected industries 50.9 per cent. of the establishments were owned by individuals and 14.1 per cent. by firms, while only 34.3 per cent. were owned by incorporated companies. This feature, however, varied much with the industry. Of the wage-earners, 44,554 were women at least sixteen years of age, and 4,301 were children under sixteen, this latter number being 26 per cent. larger than in 1900. The cities credited with

the largest values of production were: Bridgeport, \$44,586,519; New Haven, \$39,666,118; Waterbury, \$32,367,359; and Hartford, \$25,973,651.

FISHERIES. There were employed in the fisheries of the State in 1908, 882 men. The chief fish taken are shad and lobsters. The number of shad taken in 1908 was 54,878, valued at \$22,736 as compared with 46,433 valued at \$24,176 in 1907. In 1908, 901,977 pounds of lobsters were taken, valued at \$127,359. The value of the boats and apparatus used in the fisheries of the State was \$266,682 as compared with the value of \$182,344 in 1907.

CHARITIES AND CORRECTIONS. The total expense of the State for charitable and correctional institutions and societies in its charge, was, in 1908, \$1,347,749, of which \$973,891 was for maintenance and supervision; and \$373,858 for buildings. In addition to these sums, the cost to the towns for the support and relief of dependents and defectives was more than \$800,000. The amount expended by the State for the maintenance and supervision of charitable and correctional institutions shows a steady and marked advance in recent years, the most notable increase for the years 1907-8 being for the Hospital for the Insane at Norwich, for the Board of Prisoners in county jails, for new and enlarged appropriations to hospitals, for increased aid to anti-tuberculosis work, and for the amount required for the support of State paupers under the new State pauper law of 1907. Additions and improvements have been made to the jails in Hartford, Bridgeport and Norwich. The State Board of Charities recommends that a psychopathic pavilion be added for the treatment of acute cases and early attacks of insanity in the Hospital for the Insane at Middletown and at the Norwich Hospital for the Insane. The total number of insane persons under restraint in the State is about 3,700. At the school for Imbeciles in Lakeville, a new dormitory building has been completed. New hospitals have been erected in Willimantic and New Haven. Excellent work is being accomplished in the treatment of tuberculosis, both at the branch of the Hartford Hospital at Cedar Mountain and at Gaylor Farm Sanatorium in Wallingford. The records of the eight county temporary homes for dependent and neglected children show a slightly smaller number of children committed to the homes, and also a smaller number than usual placed out in family homes or returned to relatives and friends. New buildings have been erected for the New Haven County Home. The operation of the new State pauper law of 1907 has already resulted in a large increase in the number of paupers aided or supported by the State.

EDUCATION. According to the statement of the Secretary of the State Board of Education, the school population (ages 4 to 16 years) in Oct., 1907 was 234,183. The total enrollment in public schools in 1907 was 179,177, and the average daily attendance was 134,602. The high school enrollment was 10,715, practically all the high salary of men teachers was \$108.19, and of women \$47.38. The average length of the school term was 186 days. The total expenditure for public schools was \$4,335,802.86, of which 80.92 per cent. was derived from local taxes, 11.43 per schools having three or four year courses. The teachers in all the schools numbered 4,884, of whom 4,552 were women. The average monthly

cent. from State taxes, and 3.32 per cent. from government funds.

POLITICAL CONVENTIONS AND ELECTIONS. A convention for the nomination of delegates to the Republican National Convention was held at Hartford, May 6th, and instructed the delegates-at-large to vote for Secretary Taft, the first time in the history of the party that instructions were given. Two of the four districts also instructed, and all fourteen of the delegates voted at Chicago for Taft. The platform adopted endorsed the Roosevelt administration and called for tariff revision by its friends. The Republican State Convention was held at New Haven Sept. 9th. George L. Lilley, of Waterbury, congressman-at-large, was nominated for governor, and Frank B. Weeks, of Middletown, for lieutenant governor. Mr. Lilley was a prominent figure in Congress during the winter session of 1908, where he brought charges against the Electric Boat Company, successor to the Holland Submarine Boat Company. These charges were dismissed after a hearing by a Congressional committee. (See CONGRESS.) There was bitter opposition to his nomination, but he had the support of the State organization and received 402 of the 577 votes in convention. The platform approved the administration of President Roosevelt and endorsed the Republican National Platform.

The Democratic State Convention for the selection of delegates to the Democratic National Convention met at New Haven April 20th. In spite of a vigorous attempt on the part of his sympathizers, resolutions endorsing Mr. Bryan for the presidency were defeated. The Democratic State Convention for the nomination of candidate for governor and other State offices met at Hartford Sept. 16th. Judge A. Heaton Robertson, of New Haven, was nominated by acclamation for governor, and Rollin U. Tyler, of Haddam, for lieutenant governor.

In the election of Nov. 3, the votes cast for the national ticket were as follows: Taft, 112,815; Bryan, 68,255; Chafin, 2,380; Debs, 5,113. The vote for governor was: Lilley, Republican, 98,179, Thayer, Democratic, 82,260.

On Dec. 26th, an "election court," provided under the Corrupt Practices Act, assembled to hear charges against Governor-Elect Lilley and his political agent, Colonel Isaac M. Ullman of New Haven. The two judges of the Superior Court, who constituted this tribunal, gave their opinion that the act was unconstitutional in that it disqualified for office-holding any person who was found guilty, while the Constitution provides that no one shall be disqualified except after conviction of an infamous crime in a trial by jury. The proceedings were accordingly dismissed.

OTHER EVENTS. A notable celebration began at Hartford, Oct. 6th, in commemoration of the completion of a stone bridge between Hartford and East Hartford, costing about three million dollars and said to be the finest structure of its kind in the world. The celebration included parades and many beautiful historical pageants. It lasted three days. William F. Walker, the treasurer of the Savings Bank of New Britain, who absconded with about \$350,000 of the funds of the bank in 1907 without, however, affecting the solvency of the institution, was returned to the State on July 24th after a year spent in evading the police authorities. He was finally captured at Ensenada, Mexico. Betts Academy, one of the oldest and best known preparatory

schools in New England, was burned Jan. 22nd at Stamford, with a loss of \$100,000.

STATE OFFICERS. Governor, George L. Lilley; Lieutenant-Governor, Frank B. Weeks; Secretary of State, Matthew H. Rogers; Treasurer, Freeman F. Patten; Comptroller, Thos. D. Bradstreet; Attorney-General, Marcus H. Holcomb; Adjutant-General, George M. Cole; Commissioner of Insurance, Theodore H. Macdonald—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Simeon E. Baldwin, Dem.; Associate Justices, S. O. Prentice, Rep.; F. B. Hall, Rep.; John M. Thayer, Dem.; Alberto T. Roraback, Rep.; Clerk, Geo. A. Conant.

The legislature of 1908 was composed of 26 Republicans and 9 Democrats in the Senate, and 191 Republicans and 64 Democrats in the House. The State representation in Congress will be found in the article UNITED STATES, section Congress.

CONSERVATION OF NATIONAL RESOURCES. COMMISSION ON. See AGRICULTURE; FORESTRY; PAPER; SOILS; and article UNITED STATES, paragraph *Internal Waterways and National Resources*

CONSTRUCTION. See ARCHITECTURE.

CONSULAR SERVICE. See UNITED STATES.

CONSUMPTION. See TUBERCULOSIS.

COOPER, SIR ALFRED. An English surgeon, died on Mar. 3, 1908. He was born in Norwich in 1838, was educated at the school of St. Bartholomew's Hospital, in London, became a member of the Royal College of Surgeons of England in 1861, and a fellow of that institution in 1870. He was a surgeon in the Lock Hospital, in London, for several years, and was also on the staff of other hospitals. He was knighted in 1902 for his services for maintaining a hospital in connection with the Prince of Wales's hospital ship during the Boer war.

COÖPERATION. The last few years have witnessed a rapid development of the coöperative movement in central European countries and the United States. The great variety of fields into which coöperative effort was being extended may be indicated by a simple enumeration of a few of the new enterprises of 1908. In New York City coöperative apartment houses reached the number of a full half-dozen; the same idea found expression in Chicago; in Minnesota 100 creameries joined efforts in the coöperative marketing of products; coöperative creameries were established by farmers in various western States; 30 girls in New York City formed a coöperative sewing-shop; a coöperative trolley line began business at Celina, Ohio; certain labor unions in Chicago established a coöperative hospital; a coöperative factory for farm implements was started at Plano, Illinois; a coöperative suburban town near New York City was established; the Inland Coöperative Telephone Association at Pullman, Washington, declared 15 per cent. dividends; numerous coöperative stores were formed in the Mississippi Valley and on the Pacific Slope, and coöperative grain and elevator companies throughout the grain States had a successful year. There was also a considerable development of coöperation among farmers in the grain, tobacco and cotton belts in the marketing of their products.

However, coöperation in the United States was hardly more than local and spasmodic. In

Belgium, France, Germany, Denmark, and the United Kingdom on the other hand coöperation in certain respects has become national and permanently established. In Belgium and France coöperation among farmers, largely inspired and directed by Catholic priests, has become very extensive. In Belgium, where political affairs are determined by the relative strength of Socialists and Catholics, farmers' coöperative societies (*Syndicats Agricoles*) are formed by the latter as a defense against and check upon the former. In southern France, however, the Socialists are carrying on a coöperative association among farmers. In Belgium these societies not only secure immense advantages in the purchase of fertilizers, food-stuffs for cattle, supplies, and implements, but they control dairies and mills and numerous retail stores. They have also engaged in insurance and have attained efficiency in the marketing of products on a large scale. By making available to all peasant farmers of the group scientific knowledge of the value of fertilizers, of intensive cultivation, and of other features of scientific agriculture, they have prevented the exploitation of ignorant farmers on the one hand, and increased the value of land, cattle, horses, and products. Similar results have been achieved in Denmark. Here coöperation by raising the conditions of rural life has checked the flow of population to the towns. In this country there were more than 1200 distributive coöperative societies in 1906; more than one-half the population are in practical union with some form of coöperation. In England this proportion is estimated at about one-fifth, and in Germany, Austria, Belgium, Holland and France at about one-fourth. The report of the 40th Annual Congress of the Coöperative Union of Great Britain, an association in the retail trade, showed a total membership of 2,434,085, an increase of 101,330 during the year. In Sweden there were registered 3162 coöperative societies in 1906; in Finland, 1016; in Hungary, 800 distributive coöperative societies and 1650 credit associations in 1907; in Switzerland, 2138 societies in 1907; and in Germany, 25,714 societies in 1906.

COOPER UNION FOR THE ADVANCEMENT OF SCIENCE AND ART. An institution founded in New York City for free instruction in science and art, by Peter Cooper, and chartered in 1857. The Institute includes the following departments; day school of technical science; night school of science; night school of art; women's art school; school of stenography and type-writing; school of telegraphy; school of elocution; school of oratory and debate, and parliamentary procedure; reading room and library, and the museum for the arts of decoration. The Union has developed so rapidly that it has outgrown its original building in Cooper Square, and a lease has been made of the old 69th Regiment Armory, directly opposite. This building will be altered and remodelled and will be called the Hewitt Addition to Cooper Union, in recognition of the long and invaluable service rendered to the Union by the late Abram Hewitt. The highest attendance reached in the year ending June 4, 1908 was 2,505, distributed as follows: General science course, 667; electrical course, 114; chemical course, 154; night art classes, 1,333; day school, 237. The 49th annual report as submitted June 4, 1908, shows the revenue for the year of \$161,228.30 and ex-

penditures of \$161,390.70, leaving a balance, with the balance of previous years, of \$13,714.98 to the credit of the institution. The endowment to the institution in 1908 was \$2,797,727.67. The interest on the general endowment was \$79,421.16. The income of the endowment made by Edward Cooper, Mrs. Abram S. Hewitt and their children amounted to \$36,605.29. The income on the endowment of \$600,000 made by Andrew Carnegie was \$30,000. During the year donations were made to the museum for the arts of decoration to the amount of \$3,124.21. During the year 578,582 persons visited the library and reading room, and the visitors to the museum for the arts of decoration numbered 6,284. Lectures are carried on in the great hall of the Institute in connection with Columbia University, the Board of Education, and the People's Institute. The officers of the Union in 1908 were: President, John E. Parsons; Secretary, R. Fulton Cutting; Treasurer, Edward R. Hewitt.

COPPÉE, FRANÇOIS EDOUARD JOACHIM. French poet, playwright and novelist, called the "poet of the people," died on May 23, 1908. He was born in Paris, on Jan. 12, 1842. For a time he was a clerk in the War Department (where his father was employed); then for several years he was assistant librarian of the French Senate (a sinecure which he obtained largely through the influence of the Princess Mathilde, and which permitted him to devote himself to literary work); and he was archivist of the Comédie Française from 1878 until 1884, when he resigned upon being elected to the French Academy. In 1888 he was made an officer of the Legion of Honor.

In his boyhood, Coppée had written verse of much merit, and he continued to write during his clerkship. Definite recognition of his literary ability came in 1866 through his contribution in that year to the volume of poems published by the "Parnassians," and his reputation was further enhanced, in the popular estimation, at least, by published collections of his verses entitled *Le reliquaire* (1866), *Les intimités* (1868) and *Poèmes modernes* (1869), from the last named of which two poems in particular, "La Bénédiction" and "La Grève des forgerons," became known throughout France. But his real fame was assured when his little romantic play *Le passant* was presented at the Odéon, on the night of Jan. 14, 1869. Paris went into raptures over this versified drama in one act, lasting less than half an hour, and in it Bernhardt found the material for one of her most artistic impersonations. His *Deux douleurs*, played at the Théâtre Française in 1870, had only qualified success, and his *L'abandonnée*, presented in 1871, was somewhat coldly received; but his *Fais ce que dois* (Odéon, 1871), a dramatic episode in one act, had a vein of dignified patriotism which appealed strongly to the French in their then humiliation, and aroused enthusiasm little less general and genuine than that which had greeted *Le passant*. *Les bijoux de la délivrance* (1872), was also very cordially received, while *Le Luthier de Cremona* (1876) was pronounced worthy to be classed with *Le passant*. With D'Artois he also wrote at about this time the four-act play, *Le petit marquis*, and *La guerre de cent ans* (1878), a drama in five acts. His other plays include *Le trésor*, a comedy in one act, in verse (1880); *Madame de Maintenon*, an ambitious five-act drama, in verse (1881);

Severo Torelli, also a five-act drama, in verse (1883); *Les Jacobites* (1885); *Le pater* (1895), with the Commune as its theme, and suppressed by the government as incendiary, after its third performance, and *Pour la couronne* (1895). The last named dealt with the struggle of the Bulgarians to free themselves from the Turks. Forbes Robertson and Mrs. Patrick Campbell played in London with considerable success a translation of this piece, but a similar production in the United States did not succeed.

Coppée's prose works include such novels as *Le pendant le siège* (1874); *Henriette* (1889); *Rivales* (1893); *Le coupable* (1897), and *Les vrais riches* (1898); besides the very popular short stories, *Contes en prose* (1882); *Vingt contes nouveaux* (1883), and *Contes rapides* (1889). It was said, and truly, of Coppée, that he was able to "please both the Academicians and the people," and though certain of the critics disparaged as "mediocre" his simple verses, dealing with homely life, and the less complex emotions, it seems clear that the most lasting things he did are these expressions, by reason of which he has been called the "creator for the French of *genre* poetry." In the *Annales*, Paul Bourget said of him that "of all contemporary poets he was the only one who was wholly and inimitably French," and that "his work was natural, just, precise and perfectly finished." In strange contrast with his essential gentleness was his bitter and aggressive participation in the persecution of Captain Dreyfus. In 1898 Coppée became a devout Roman Catholic, and his book *La bonne souffrance* expresses his attitude toward that religion.

COPPER. The copper industry of the United States during the year 1908 experienced a gradual recovery from the severe depression suffered in the last part of 1907. Many producers who had greatly curtailed or even suspended production in that year began again to increase output practically at the opening of 1908, and in spite of the low price of the metal, nearly all of the important producers of 1907 were in operation throughout most of 1908, and a few new companies began production during the year. The rate of production steadily increased and at the close of the year was greater than at any other time in the history of the industry.

The production of blister and Lake copper in 1908 from ores mined in the United States, according to returns and careful estimates of the United States Geological Survey, was greater by about 50,000,000 pounds, or between 5 and 6 per cent., than that in 1907, which was 868,996,491 pounds. Arizona and Montana, ranking in the order named as in 1907, showed large gains over that year, but Michigan showed little change from 1907. The production of total refined new copper, it was thought, would hardly equal the output of 1907, which was 1,032,516,247 pounds. In Mexico the production of copper for 1908 was estimated by the *Engineering and Mining Journal* at 84,159,000 pounds as compared with 126,710,000 in 1907. Boleo was the largest producer in 1908, being followed next by Aguascalientes, and then by Cananea, where new concentrators and a new smelting plant had been constructed. In Canada 53,494,202 pounds of copper were produced as compared with 46,356,382 pounds in 1907.

Stocks of refined copper were undoubtedly very large, and domestic consumption of new copper showed a decline from the 485,000,000

UNITED STATES COPPER PRODUCTION AND SUPPLY, 1903-8.

(f) Report of the Copper Producers' Association of Marketable Copper. (g) No reliable statistics available.

pounds of 1907. The average quoted price of electrolytic copper at New York for 1908 was 13.20 cents. The price at the close of the year was 14.18 cents. The average for Lake was 13.424 cents and the price at the end of the year was 14.25 cents. In 1907 the average prices were 20.04 for electrolytic and 20.661 for Lake.

PRODUCTION OF COPPER IN THE UNITED STATES, ARRANGED BY GROUPS OF PRODUCERS

(Estimates by *Engineering and Mining Journal*)

Group	1907	1908
Michigan mines	220,317,041	221,500,000
Smelters in Arizona and Texas	262,597,624	293,365,977
Smelters in Montana and Wyoming	229,362,164	258,102,000
Smelters in Utah and Nevada	90,100,052	81,051,799
Smelters on Pacific Coast (a)	21,936,026	40,698,720
Smelters in Mississippi Valley	24,062,560	24,019,355
Smelters on Atlantic Coast (a)	13,640,930	15,190,847
Smelters in Tennessee	14,784,379	14,750,000
Miscellaneous (b)	2,441,000	3,716,779
Totals	879,241,766	952,395,477

(a) These statistics do not measure the relative importance of these groups of smelters which produce much copper from foreign ore. (b) Includes exports of ore and matte and copper produced by lead desilverizers.

The exports of copper from the United States in 1908 amounted to 661,876,127 pounds of metallic copper in the form of pigs, ingots, bars, plates, etc., as compared with 508,929,401 pounds in 1907. The exports of ore, matte, and regulus amounted to 63,149 tons in 1908 as against 99,141 tons in 1907. The total value of the exports in 1908 exclusive of ore amounted to \$96,555,503 as against \$100,800,355 in 1907. Germany and Holland were the best customers for American copper and were fol-

lowed by France and Great Britain. The imports of copper during the calendar year 1908 amounted to 162,224,144 pounds as against 192,901,267 pounds in 1907. In 1908 the receipts from Europe and Mexico and from South America, with the single exception of Peru, decreased considerably, but Peru increased its exports to the United States from 14,945,697 pounds in 1907 to 23,646,921 pounds in 1908. As regards the import of copper ores, much of this material is sent to the United States for refining and preparation in a final marketable form. The total exports and net imports for the two years are stated as follows:

	1907. Pounds	1908. Pounds	Changes Pounds
Exports	424,257,901	675,508,427	I. 251,250,526
Net Imports	251,624,499	217,986,546	D. 33,637,953
Excess, exports	172,633,402	457,521,881	I. 284,888,479

There were, in addition, manufactures of copper in 1908 not figuring in the above classification, amounting to \$3,162,303 as compared with \$5,888,170 in 1907.

CORINTH, EXCAVATIONS IN. See **ARCHÆOLOGY.**

CORN. Weather conditions during the spring of 1908 in parts of the corn belt in the United States were unfavorable and made the outlook for a good crop rather unpromising. Continued rains in May not only delayed planting but left the fields in a weedy condition while at the same time the period for cultivation was reduced by the approach of other farm work. In parts of the river bottoms of the Ohio, the Mississippi, and the Missouri and in sections westward to Kansas planting was delayed until June and even as late as the latter part of that month. The untoward weather conditions of the early season caused an irregular and uneven stand and a poor and shallow root development which was plainly shown when

later in the summer the wet weather was followed by a hot and dry period. In the eastern part of the country where the planting season had not been so unfavorable the summer drouth was quite injurious. There was, however, enough good weather during the entire season and the first fall frosts were delayed long enough to mature a remarkably good yield of corn.

The total production in 1908 for the United States, as reported by the Department of Agriculture, was 2,668,651,000 bushels. This yield was grown on 101,788,000 acres, making an average for the year of 26.2 bushels per acre. The total yield of 1908 was exceeded only twice in the United States, in 1905 when 2,707,993,500 bushels were produced and in 1906 when the total crop amounted to 2,927,416,000 bushels. In the valuation of the crop the reduction in yield was readily offset by the exceptionally high price, which was 60.6 cents on December 1, 1908. This price was exceeded only once, in 1881 when corn on December 1 was worth 63.6

cents per bushel. In 1901 when there was produced only two-thirds of the ordinary crop, the farm price per bushel on that date was 60.5 cents. The total farm value of the crop on December 1, 1908, was \$1,616,145,000 and was by far the highest ever reached, being about \$280,000,000 greater than the total value of the crop of 1907 which ranks next. In acreage 1908 also held the record, the area being greater by 1,857,000 acres than that of the previous year which stood second in this regard. According to the *American Agriculturist* this was the largest area ever devoted to a single crop in any country of the world. The American corn field was greater than the total area of many important countries. It was almost as large as Germany and produced seven-eighths of the world's crop.

The production, acreage, etc., of the principal corn growing States for 1908 as given by the Department of Agriculture are shown in the following table:

State	Acreage	Yield per Acre (Bu'ls)	Production (Bushels)	Price per Bushel Dec. 1 (Cts)	Total Value (Dollars)
Illinois	9,450,000	31.6	298,620,000	57	170,213,000
Iowa	9,068,000	31.7	287,456,000	52	149,477,000
Nebraska	7,621,000	27.0	206,767,000	51	104,941,000
Missouri	7,542,000	27.0	203,634,000	57	116,071,000
Texas	7,854,000	25.7	201,848,000	59	119,090,000
Kansas	7,100,000	22.0	156,200,000	55	85,910,000
Indiana	4,549,000	30.3	137,835,000	60	82,701,000
Ohio	3,550,000	38.5	136,675,000	63	86,105,000
Oklahoma	4,929,000	24.8	122,239,000	51	62,342,000
Totals	61,663,000		1,750,274,000		976,850,000

It is seen that these 9 States contained about 60 per cent. of the acreage of the entire country and produced about 65 per cent. of the total crop.

Statistics of the Department of Agriculture show that during the 10 months ending October 31, 1908, the United States exported 27,971,574 bushels of corn as compared with 74,524,866 bushels for the corresponding period in 1907. It is estimated that for the fiscal year ending June 30, 1908, the exports were 32,000,000 bushels less than in 1907. This was mostly due to the high price of corn.

The efforts to improve the corn crop and to increase the average acre yield put forth in 1908 were no less vigorous than in 1907 and other previous seasons. This is preëminently an age for breeding field crops and it is of interest to note that the Illinois Experiment Station starting with a variety of average composition has been able by selection and breeding, in 10 generations, to increase the average protein content from 10.92 to 14.26 per cent.; to decrease the average protein content from 10.92 to 8.64 per cent.; to increase the average oil content from 4.70 to 7.37 per cent., and to decrease the average oil content from 4.70 to 2.66 per cent.

The second national corn exposition, held at Omaha, December 9 to 19, was reported as a greater success than the first one held at Chicago in 1907. About 44,000 ears of corn were displayed, but the exhibits were not limited to

corn alone, wheat, oats, rye, barley, millet, alfalfa, and clover also being shown. About 100,000 persons attended the exposition, and prizes amounting to \$54,000 in cash and merchandise were offered. The entries numbered 7731 and represented 28 States. Mexico exhibited the different types of corn produced in its territory. Johnson County, Ind., showed the grand champion single ear and also the grand champion 10-ear lot which were sold at auction at the close of the exposition for \$75 and \$280 respectively. The prize for largest acre yield went to N. Howard Brewer, of Hockanum, Conn., who grew 133 bushels per acre.

CORN EXPOSITION. See AGRICULTURE.

CORNELL UNIVERSITY. An institution of higher learning, founded in 1865 at Ithaca, N. Y. The total number of students for the year ending September, 1908, was 4465, of whom 3734 were regularly enrolled students during the academic year from September to June, and the rest attendants at the summer session and the winter school in agriculture. The enrollment in the fall of 1908 was 4999, of whom 3888 were enrolled in the regular courses for the academic year. The distribution in 1908-9 was as follows: Graduate Department, 246; College of Arts and Sciences, 223; Medical College, 207; State College of Agriculture, 394; State College of Veterinary Medicine, 91; College of Architecture, 130; College of Civil En-

gineering, 569; Sibley College of Mechanical Engineering, 1158. The faculty numbered 566. The number of students from New York State numbered 2052. Nearly every State in the Union was represented, as were the Philippines, Hawaii, and Porto Rico. Students were drawn from 32 foreign countries. Nearly fifty acres of land were acquired in 1908 as an extension of the campus proper on the southeast, thus making the entire area now, including the campus, 350 acres. The productive fund of the University on August 1, 1908, amounted to \$8,628,370, while the inventoried value of the University grounds and buildings was \$4,263,405. The total income from all sources for the year amounted to \$1,356,498. The library contains over 353,000 volumes, and more than 53,000 pamphlets. Revised entrance requirements went into effect at the beginning of the college year 1908.

COSTA RICA. A republic of Central America. Area, 18,691 square miles. On December 31, 1907, the population was estimated at 351,176. In 1906 there were 8795 immigrants and 6528 emigrants; in 1907, 12,895 immigrants and 8510 emigrants. The births and deaths in 1906 numbered 14,208 and 8346; in 1907, 14,762 and 8861. The principal cities are: San José, the capital, 26,682 inhabitants; Cartago, 10,000; Port Limon, 8000; Heredia, 8000; Alajuela, 6000; Puntarenas, 5000.

EDUCATION. Elementary education is free and compulsory. The elementary schools are maintained by local school councils, but the teachers are paid by the national government. In September, 1908, a law was passed establishing a national fund for the maintenance of primary schools out of a tax on alcohol and liquors. In 1905 there were 386 elementary schools, with 991 teachers, 22,274 enrolled pupils, and 17,985 average attendance. The study of English is compulsory in all schools. At San José, Cartago, Alajuela, and Heredia there are lyceums or colleges. For professional instruction there are schools of medicine, pharmacy, dentistry, and law.

PRODUCTION. Coffee of the highest grade is especially cultivated on the Pacific slope, in the departments of San José, Alajuela, and Cartago. In 1905, 74,625 acres were under coffee. Its cultivation has not been increasing in recent years, owing to the competition of the cheaper grades of other countries. From October 1, 1906, to September 30, 1907, the export of coffee amounted to 17,325 metric tons, valued at \$3,419,000. Banana cultivation is rapidly extending. The United Fruit Company, an American corporation, owns 150,000 acres of banana land, of which over 22,000 acres are under cultivation. In 1907 there were exported 10,165,759 bunches of bananas, valued at \$4,864,000. Cacao culture is increasing. Small plantations of rubber in the plains of Serapiquí and San Carlos have proven successful. Cultivated pastures occupy about 311,000 acres, and natural pastures about 342,000 acres. The number of cattle is 308,000; hogs, 80,000; horses, 52,000; mules, 3000. The greater part of the country, held in large tracts under ancient grants, is unoccupied. Some rich gold mines are being worked on the Pacific side; the export of gold and silver bullion in 1907 amounted to \$535,000.

FOREIGN COMMERCE. In 1907 imports of merchandise were valued at 16,731,066 colones (1 colon equals 46.5 cents), and exports of

merchandise at 19,550,105 colones. The principal imports were textiles, foods and provisions, and cattle. The leading exports were bananas, 10,166,551 colones; coffee, 7,147,544 colones; gold in bars, 1,118,399; woods, 472,389; hides and skins, 168,739; gums, 166,630; cacao, 147,369; and the remainder, silver, rubber, tortoise shell, and mother-of-pearl. About one-half the total trade is with the United States, one-fourth with Great Britain, and the remainder with Germany, France, etc.

COMMUNICATIONS. The total length of railways in 1907 was 395 miles. In August, 1908, the government concluded a contract for the completion of the Pacific Railway between San José and Puntarenas. The section is about 12 miles long, and was to be completed in 15 months. This will establish communication between Port Limon, on the Atlantic, and Puntarenas, on the Pacific, via San José. The length of telegraph wires in 1907 was 1207 miles. In 1907 Port Limon was entered by 609 vessels, of 909,008 tons, and cleared by 610 vessels, of 915,988 tons. Puntarenas was entered by 102 vessels, of 210,962 tons.

FINANCE, ETC. During the year ending March 31, 1908, the revenues amounted to 7,916,474 colones (of 46.5 cents each), and the expenditures, 9,191,449. The deficit was occasioned by extraordinary expenditures on railways, public buildings, and the establishment of the liquor monopoly. For 1908-9 the revenues were estimated at 7,535,000 colones, and the expenditures at 7,359,003. The principal sources of revenue for 1908-9 were estimated as follows: Customs, 4,650,000; liquors, 1,850,000; Pacific Railway, 300,000; posts and telegraphs, 300,000. The foreign debt on March 31, 1907, amounted to 11,690,925 gold pesos (1 gold peso equals 2.15 colones); the internal debt, 9,752,685 colones. The maximum of the peace army is 1000 infantry and artillery. The navy consists of one torpedo-boat and one gunboat. The country is divided into 26 sanitary districts, in charge of medical men paid from the national treasury. The President in 1908 was Cleto Gonzalez Viquez, whose term is May 8, 1906-1910.

HISTORY. At the opening of Congress on May 1, 1908, President Viquez reported on the condition of the republic during the preceding year. He emphasized the friendly relations with foreign powers, and announced that the treaties and conferences resulting from the Peace Conference at Washington had been subsequently confirmed by the government. Cartago was chosen as the city of the first Central American Court of Justice. In January, 1908, the presidents of Costa Rica and Nicaragua conferred, and measures for the common benefit of the two states were agreed upon. A convention for the exchange of parcels by post was concluded with Chile and became operative on July 1, 1908.

COTTON. The cotton crop of the United States for 1908-9 was one of the three largest in the history of the country and in value it was estimated that it would rank next to the highest. On December 31, 1908, the Bureau of the Census reported 27,386 gins in active operation and there had been ginned to that date 12,470,226 running bales as compared with 9,951,505 bales on the same date the year before. The crop of 1907 was 11,325,882 running bales, equivalent to 11,107,179 bales of 500 lbs. each. The estimate of the U. S. Department of Agri-

culture made in December, 1908, was 12,920,000 bales of 500 lbs. each. The report of the Census Bureau would indicate a somewhat larger crop than the estimate of the Department of Agriculture, but it was possible that the record breaking return of ginned cotton might be due in part at least to the unusually favorable autumn weather throughout the cotton region, enabling planters to pick and gin their crop earlier than usual.

The estimated production of cotton by States was as follows:

ESTIMATED YIELD OF COTTON IN 1908-9
IN 500 POUND BALES

State	Production
	Bales
Virginia	13,000
North Carolina	619,000
South Carolina	1,118,000
Georgia	1,844,000
Florida	61,000
Alabama	1,273,000
Mississippi	1,560,000
Louisiana	472,000
Texas	3,917,000
Arkansas	1,009,000
Tennessee	340,000
Missouri	54,000
Oklahoma	640,000
United States	12,920,000

This estimate did not include linters. The crop of 1907-8 was made up of 11,070,200 running bales of upland, 86,895 bales of sea island cotton, and 268,060 bales of linters. The total crop for the years 1903 to 1907, including linters and counting round bales as half bales, were as follows:

COTTON PRODUCTION OF THE UNITED STATES
1903-1907

Year	Bales
1903	10,400,825
1904	13,845,385
1905	10,865,520
1906	13,439,374
1907	11,425,156

This cotton was practically produced in 16 States and Territories, the States ranking in 1907 as follows:

COTTON PRODUCTION BY STATES, 1907

State	Rank	Number of running bales
Texas	1	2,308,376
Georgia	2	1,903,016
Mississippi	3	1,481,986
South Carolina	4	1,186,672
Alabama	5	1,142,212
Oklahoma	6	891,850
Arkansas	7	773,461
Louisiana	8	699,119
North Carolina	9	652,930
Tennessee	10	277,445
Florida	11	57,736
Missouri	12	35,997
Virginia	13	9,602
Kentucky	14	4,273
New Mexico	15	447
Kansas	16	34

The sea island cotton crop for 1907 was produced in 49 counties of Georgia, Florida, and South Carolina. The crop and its production by States for the past five years in running bales was:

SEA ISLAND COTTON CROP, 1903 TO 1907

Growth year	Total crop	Georgia	Florida	South Carolina
	Bales	Bales	Bales	Bales
1903	75,393	36,612	27,840	9,941
1904	104,317	53,112	39,619	11,586
1905	112,539	58,311	41,531	12,697
1906	57,550	25,484	23,995	8,071
1907	86,895	44,713	28,935	13,247

From the above table it will be seen that the production of sea island cotton in Georgia and Florida both exceeded that of South Carolina, but in length and fineness of lint the crop of South Carolina surpassed that of all other regions. Attempts were made to grow sea island cotton in other States with indifferent success, and since 1899 no sea island cotton had been reported as produced in the United States except in the States mentioned.

The world's production of cotton for mill consumption in 1907, the latest crop for which data are available, was 16,512,185 bales of 500 lbs. each. The production of each of the leading countries is shown in the accompanying table adapted from U. S. Census Bureau, *Bulletin* 95.

WORLD'S PRODUCTION OF COTTON FOR
MILL CONSUMPTION IN 1907

Country	Production 500 lb. bales	Per cent. of total production
United States	10,882,385	65.9
British India	2,444,800	14.8
Egypt	1,296,000	7.8
Russia	620,000	3.8
China	428,000	2.6
Brazil	370,000	2.2
Mexico	85,000	0.5
Peru	55,000	0.3
Turkey	80,000	0.5
Persia	51,000	0.3
Other countries	200,000	1.3
Total	16,512,185	100.0

The expected crop for the United States in 1908 has already been stated. In British India, where, next to the United States, the largest proportion of the world's supply of cotton is produced, there was a reduction of 2,157,000 acres in the area planted in 1908, but an increase of about 500,000 bales in the crop was reported. While cotton is quite generally grown in India, the record of half a century shows no very great increase in her exports and it was recognized as having the lowest yield per acre of any of the cotton-producing countries, the average yield per acre for the past 10 years being only 80 pounds of lint. The third great cotton-producing country is Egypt, where the production has gradually increased until by 1908 about 1,250,000 bales were produced annually. The construction of the great irrigation works was expected greatly to increase the cotton production, but no

marked increase had been reported nor is the production liable to materially increase, according to a French authority. It was claimed that the new system of irrigation caused a rise of saline deposits in the soil, which were formerly washed out by the annual floods, that on account of the other crops water could not be given cotton when most needed, and that on account of a scarcity of work animals and implements it probably would be impossible to greatly increase the cotton production of Egypt over the present yield of 382 pounds per acre.

The other cotton-producing countries did not appear to be increasing their acreage or yield to any considerable extent. Efforts were made within the past few years to foster the production of cotton in the British, French, and German colonies, particularly the colonies in Africa. The British Cotton Growing Association was especially active in this regard, and largely under its auspices 26,000 bales of cotton were produced in 1907 as follows: British West Africa, 12,200 bales; East Africa, 5000 bales; Sind, 1800 bales; West Indies, 6500 bales; and elsewhere, 500 bales. The amounts thus far produced in the French and German colonies have been very insignificant.

In addition to its being a great producer and exporter of cotton, the United States imported from Egypt 122,170 bales and from Peru 5917 bales of cotton during the year ended August 31, 1908. These cottons were imported for special purposes, the Egyptian for thread and the finer classes of goods, and that from Peru was almost wholly used to mix with wool.

CONSUMPTION OF COTTON IN THE UNITED STATES. The mills of the United States manufacture about one-third of the cotton grown here. On August 31, 1908, there were 1941 establishments in the United States engaged in spinning raw cotton, the total number of active spindles at that time being 27,505,422 with 15 mills and 54,312 spindles that had been idle throughout the year. There were also 404,653 idle spindles in mills which consumed some cotton but were not wholly classed as cotton mills. The active spindles consumed during the year 4,493,028 bales of 500 pounds each, 4,343,440 being domestic cotton and 149,628 bales of foreign cotton. The increase in mills during the year was 111 and of spindles 1,024,972. There was, however, a reduction of 481,171 bales in the amount of cotton consumed, indicating that the conditions during the year were unfavorable to cotton manufacturing in the United States. Of the total of 27,505,442 active spindles engaged in spinning cotton in 1908, 10,200,903 were located in the cotton-producing States. The number of mills and spindles in operation in the cotton States in 1907 and 1908 were:

	1907		1908	
	Mills	Spindles	Mills	Spindles
Alabama	74	876,944	71	934,642
Arkansas	7	12,972	10	13,700
Georgia	149	1,610,004	154	1,757,686
Louisiana	14	68,724	16	69,552
Mississippi	26	162,696	28	171,720
North Carolina..	276	2,604,444	293	2,861,446
South Carolina..	145	3,502,036	150	3,617,358
Tennessee	45	230,358	51	249,604
Texas	52	103,992	55	103,423
Virginia	29	250,758	30	295,579
Missouri and Oklahoma	47	17,272	49	33,488

If these data are compared with those for 1890, the growth of cotton manufacturing in the South is seen to be very great. In 1890 there were in the cotton-growing States 1,570,288 spindles out of 10,653,435 for the entire country. In 1900 the number was 4,367,688 out of a total of 14,384,180, and in 1908 the number had increased to 10,200,903 out of 27,505,422, or the proportion of spindles in the cotton States as compared with the total for the United States was 15 per cent. in 1890, 30 per cent. in 1900, and 37 per cent. in 1908.

COTTON-SEED PRODUCTS. Cotton seed and cotton-seed products are very important factors in the cotton production of the United States, and the utilization of these products was developing rapidly also in India, Egypt, and elsewhere. Of the by-products of cotton production the oil is perhaps the most important. In 1907 there were 786 cotton-seed oil mills in the United States that expended \$7,899,000 in salaries and wages and produced products valued at \$96,407,000 as follows: Oil, 103,049,820 gallons; meal and cake, 1,043,080 tons; hulls, 926,705 tons; and linters, 128,243,639 pounds, the meal and cake being used for stock feed and fertilizer, the hulls as feed and paper stock, the linters for felt, cotton batting, etc., and the oil for the manufacture of oleomargarine, compound lard, for culinary purposes, soap making, etc. The value of the exports of cotton-seed oil in 1907 amounted to \$17,074,403, of which Austria, France, Germany, Great Britain, and Mexico took the greater portion. The exports of cotton-seed cake and meal in 1907 were 670,484 tons, valued at \$17,062,594, Denmark and Germany taking by far the greatest amount, using it largely for feeding dairy cows.

WORK OF THE U. S. DEPARTMENT OF AGRICULTURE ON COTTON. During the first session of the 60th Congress provision was made for the establishment by the Secretary of Agriculture of standards for the different grades of cotton, which were to be the official standards for the classification of cotton. The Department of Agriculture had given much consideration to this subject and it was believed a basis for such a classification had been established. A board of cotton experts was appointed to assist in the final determination of the standards which by law are to be designated as middling fair, strict good middling, good middling, strict middling, middling, strict low middling, low middling, strict good ordinary, and good ordinary. Studies were also being made in the baling of American cotton, and it was hoped they will lead to an improvement in the methods of baling that are now the cause of immense losses.

Successful investigations were being conducted in Arizona and southeastern California in the introduction and acclimatization of Egyptian cottons. The results up to 1908 showed the possibility of producing a fibre of satisfactory length, strength, and fineness, and the experimental tracts gave very high yields. The Department was carrying on extensive experiments on the improvement of varieties of cotton and of the methods of cotton culture. These included the introduction of new species and varieties that possessed some desirable qualities and their use in breeding new varieties, breeding for resistance to disease, early maturity as a means of circumventing the boll weevil, etc.

BOLL WEEVIL. Much attention was being paid to the boll weevil and some progress in its control was to be noted. This pest was in-

troduced into Texas from Mexico about 1892 and it spread to the north and east at the average rate of about 50 miles per year. At the close of 1908 it had reached the Canadian River in Oklahoma and Arkansas on the north and Louisiana and Mississippi on the east. Its spread was checked somewhat by hot dry summers and favored by cool moist ones. It was found possible to successfully grow cotton in infested regions by attention to cultural methods with included early-ripening varieties, check systems of planting, destruction of cotton stalks in autumn, and clean cultivation. Advantage also was being taken of predaceous and parasitic insects, birds, and other natural enemies of the boll weevil, and they are being protected and distributed as rapidly and widely as possible. See ENTOMOLOGY.

CREMATION OF GARBAGE. See GARBAGE AND REFUSE DISPOSAL.

CRETE. An island in the Mediterranean, south of Greece. Area, 3327 square miles; population (1900), 310,056, including 269,719 Christians, 33,496 Mohammedans, 728 Jews, and 6113 foreigners (3977 Greeks, 1075 Turks, 556 Italians, 141 British, and 136 French). The principal towns, with their population in 1900, are Canea, the capital, 21,001; Candia (Heracleion), 22,481; and Rethymo, 9311. In 1907-8 there were 448 Christian primary schools, with 30,149 pupils; 18 Mohammedan primary schools, with 1957 pupils; and 31 Christian secondary schools, with 4174 pupils. The chief products and exports are olive oil, raisins, carob-beans, wine, almonds, silk cocoons, skins, and soap. The imports are flour, textiles, leather, metal goods, rice, barley, sugar, coffee, etc. In 1906 the imports amounted to 10,270,000 drachmas, and the exports to 17,391,000 (1 drachma equals 19.3 cents). The trade is chiefly with Greece, Turkey, Austria-Hungary, and Great Britain. The length of telegraph line is 230 miles. Crete is nominally a Turkish dependency (see below), but is autonomous and pays no tribute. In 1906 the four protecting Powers—Great Britain, Russia, France, and Italy—conferred upon the Greek King the right to propose the High Commissioner, who is chief executive. The present incumbent is Alexander Thr. A. Zaïmis, formerly Prime Minister of Greece, who assumed office on October 1, 1906, for a term of five years. Foreign relations are controlled by the representatives of the protecting Powers at Athens. The Constitution of February, 1907, provides for an Assembly of 64 members elected for two years. The High Commissioner appoints his three Councillors, or Ministers, who may sit and speak in the Assembly, but have no vote unless they are deputies. The budget for 1907-8 estimated the revenue at 5,930,332, and the expenditure at 5,905,980 drachmas. The public debt was 5,317,226 drachmas in 1907. The militia, service in which is obligatory, consists of 41 officers and 1000 men. The police force numbered 1301 in 1907. Both militia and police are under Greek officers.

HISTORY. The protecting Powers announced their decision in May that the international troops should gradually be withdrawn from the island. Some disturbance in Crete followed this announcement, and conflicts between Mohammedans and Christians were reported. The chief event of the year was the declaration on October 7 of union with Greece. The Cretan Chamber voted for union and appointed six commissioners who should govern the island in the name of the King of Greece until the Greek government was ready to take charge. The proclamation of union was immediately followed by protests from Turkey, and later (October 28) by the promise of the Powers that the matter would be made the subject of negotiation with Turkey, provided order were maintained on the island and the rights of the Moslems respected. See BALKAN QUESTION and TURKEY, paragraphs on *History*.

CRETE, EXCAVATIONS IN. See ARCHAEOLOGY.

CRICKET. The Philadelphia team of cricketers which visited Great Britain in July and August won seven out of the fourteen games played, one being a draw. In these games the batting of A. M. Wood and the bowling of J. B. King were especially noteworthy. Wood averaged 23.78 runs in 19 innings, and made a high score of 132. King took in all 115 wickets, with an average of 10.48 runs a wicket. The thirty-fourth annual match between the All-Philadelphia and the Canadian teams, held at Philadelphia on September 14 and 15, was won by the former team. In their second innings the Canadians were all out for 116 runs as against the Philadelphians scoring 173 in their first innings. The Metropolitan District League championship in Class A was won by the Columbia Oval team, which had six victories and no defeats. The Class B championship was won by Manhattan.

CROSS COUNTRY RUNNING AND MARATHONS. Cross country running was very popular during 1908, more events of the kind being held than in any previous year. The Amateur Athletic Union's junior and senior championships took place at Celtic Park, Long Island, on November 14. James J. Lee, of the Boston A. A., won the junior event, covering the distance of 6¼ miles in 36 minutes, 18 seconds. The winning club in this event was the Trinity A. C., which scored a total of 78 points. The senior championship was won by Fred Bellars, of the New York A. C., who covered the distance in 34 minutes, 15 seconds. The Irish-American A. C. scored the most points, having six of the seven first places.

The Intercollegiate Championship, held at Princeton, N. J., on November 21, had seventy-two starters. The winner was H. C. Young, of Cornell, whose time was 34 minutes, 14 seconds. G. A. Dull, of Michigan, finished second in 34 minutes, 16 seconds, and H. Jacques, of Harvard, third in 34 minutes, 20 seconds. The team scores were: Cornell, 29; Syracuse, 87; Harvard, 89; Yale, 90; Michigan, 105; Pennsylvania, 134; Columbia, 188. Princeton failed to finish. In college dual runs Cornell and Harvard each defeated Yale, and Carlisle defeated Pennsylvania.

On November 25, at Madison Square Garden, New York City, John J. Hayes, winner of the Marathon race at the Olympic games (q. v.),

was defeated by Dorando Pietri, Italy, the winner's time being 2 hours, 44 minutes, 20 2-5 seconds. On December 15, Dorando was in turn defeated by Tom Longboat, whose time was 2 hours, 45 minutes, 52 2-5 seconds. The Marathon distance is 26 miles, 385 yards.

CROWNINSHIELD, ARENT SCHUYLER. An American naval officer, died in Philadelphia, on May 27, 1908. He was born at Seneca Falls, N. Y., on March 14, 1843, and graduated at Annapolis in 1863. He took part in the two attacks on Fort Fisher while attached to the *Ticonderoga* during the Civil War. He became a lieutenant in 1866, lieutenant-commander in 1868, commander in 1880, captain in 1894, and rear-admiral in 1902, retiring in 1903. During the Spanish-American War he was a member of the Board of Naval Strategy. He commanded the European squadron which was present in English waters in honor of the coronation of Edward VII in 1902.

CRUELTY TO ANIMALS, AMERICAN SOCIETY FOR THE PREVENTION OF. An institution whose object is sufficiently indicated by its name, founded in 1866. The 42nd annual report, covering the year 1907, indicated that 6567 complaints of alleged cruelty were investigated during the year, resulting in 1015 arrests and prosecutions; 7861 animals were suspended from labor; 4419 horses, mules and other large animals were humanely destroyed; 108,619 small animals, homeless or disabled past recovery, were also destroyed, and 1015 disabled horses and other large animals were removed in ambulances. The excess of expenses over income was \$1,921.82. The Society received a bequest during the year of \$6,687.50, and from members' dues, donations and other sources, \$113,861.05. The President is Alfred Wagstaff, and the Secretary, Richard Welling. The Society has a handsome building at the corner of Madison Avenue and 26th Street, New York City.

CRUELTY TO CHILDREN, NEW YORK SOCIETY FOR THE PREVENTION OF. A society whose purpose is indicated by its name, organized in 1874. During 1907 the Society received 15,892 complaints and prosecuted 10,371 offenders, of whom 8456 were convicted. There were rescued from destitution and vicious surroundings, 9952 children, and 8192 received care, food, and clothing at the building of the Society. All complaints of neglected children are investigated by the Society and offenders against the law are vigorously prosecuted. A school of instruction for prospective workers has been organized and is conducted in the building of the Society at 297 Fourth Avenue, New York City. The President is John D. Lindsay, the Secretary and Superintendent, E. Fellows Jenkins.

CRUISER-BATTLESHIPS. See **BATTLESHIPS.**

CUBA. An island republic of the West Indies, in 1908 under the protection of the United States. Area, 45,881 square miles. According to the census of 1907 the population numbered 2,048,980, against 1,572,845 in 1895. The population in 1907 by provinces was as follows: Pinar del Rio, 240,372; Havana, 538,010; Matanzas, 239,812; Santa Clara, 457,431; Camaguey, 118,269; Oriente, 455,086. The principal cities, with their populations in 1907, are: Havana, 297,159; Santiago, 45,470; Matanzas, 36,009; Cienfuegos, 30,100; Camaguey, 26,616; Cardenas,

24,280. The immigrants in 1905-6 numbered 52,652; in 1906-7, 29,572; in 1907-8, 31,227, including in the last year 24,792 Spaniards, 1928 Americans, 1438 British, and 107 Germans.

MINING AND FISHING. The minerals include iron, manganese, copper, gold, lead, zinc, coal, asphalt, asbestos, and graphite. Very few of the mines are worked. The exports of minerals to the United States during the year ending June 30, 1908, consisted of 3,520,679 pounds of copper ore, matte, and regulus, valued at \$382,460; 486,038 pounds of copper pigs, bars, ingots, and plates, valued at \$66,315; 646,443 tons of iron ore, valued at \$2,275,625; and 20,331 tons of manganese ore, valued at \$182,972. The Spanish-American Iron Co., which is owned by the Pennsylvania Steel Co., owns the Mayari deposits, in the province of Oriente, which are estimated to contain 600,000,000 tons of iron ore. In 1908 the company had 1000 men engaged in the construction of its plants, a railway of 14 miles from the mountains to the coast, and harbor works on the Bay of Nipe. The Bethlehem Steel Co. acquired 875 acres about 12 miles east of Santiago, which are estimated to contain 75,000,000 tons of iron ore, of which 2 per cent. is nickel and 1 per cent. chromium. The export of sponges to the United States in the same year was valued at \$125,779. A valuable salt deposit was discovered in 1908 in the province of Matanzas, and preparations for working it were started. The product is pure.

AGRICULTURE. In the season 1906-7 sugar cane took up about 341,848 hectares (1 hectare equals 2.47 acres), against 301,440 in 1905-6. The output of crude sugar in 1906-7 was 1,444,310 long tons, against 1,229,736 in 1905-6. For 1907-8 the crude sugar output was estimated at 985,711 tons. The output of 1906-7 was valued at \$72,134,999, against \$60,328,753 in 1905-6. The export of 1906-7 was 1,292,777 long tons of raw sugar and 3311 tons of refined sugar, valued at \$64,720,336, against 1,180,615 tons in 1905-6, valued at \$57,909,932. The production of molasses in 1906-7 was 46,745,650 gallons, of which 34,532,005 gallons, valued at \$936,789, were exported. The manufacture of aguardiente (native rum or brandy) in 1906-7 amounted to 6,806,333 gallons, against 4,683,562 in 1905-6; of alcohol, 2,954,809 gallons, against 2,843,548 in 1905-6. The value of the total exports of sugar and its products, including molasses, sweets, aguardiente, and other distilled products, was \$66,012,642 in 1906-7, against \$58,969,916 in 1905-6. The number of sugar mills in operation in 1906-7 was 184; in 1907-8, 108. A statement made as to the ownership of the sugar plantations, meaning those which produce sugar and not cane alone, assigns 74 to Cubans, 76 to Europeans, and 36 to Americans. The American mills are of the most modern and efficient construction, many of the Cuban mills are of obsolete type, while the European mills take middle rank. Of the production of 1906-7, about 35 per cent. is assigned to the Cuban mills, 35 per cent. to the European, and 30 per cent. to the American. The entire area suitable for growing sugar cane is estimated at 15,451,000 acres.

The output of tobacco in 1907 amounted to 440,145 bales (to which the Vuelta Abajo contributed 234,012 bales), against 286,288 bales in 1906. The exports of tobacco and tobacco manufactures in 1907 were valued at \$28,645,908,

against \$36,702,585 in 1906, while the native consumption is estimated at \$13,697,640 and \$12,334,154 during the two years, making the total crop value aggregate \$42,343,548 in 1907 and \$49,036,740 in 1906. Out of a total of 200,672 bales of leaf tobacco exported in 1907 and valued at \$14,960,933, the United States took 180,274. Of the 186,428,607 cigars sent abroad in 1907, worth \$13,112,226 (out of a total production of 364,400,997), the United States received 61,869,131. The cigarette production in 1907 was 227,299,494 packages, of which 16,505,104, valued at \$449,928, were exported and 210,794,390 consumed locally.

The production of oranges is rapidly extending. For 1908 the crop was estimated at 800,000 boxes. Until the three years before 1908 large quantities of oranges were annually imported into Cuba from Florida and California, and while the scientific cultivation of the fruit was in its infancy, its development had been so rapid and generally profitable that it was be-

lieved that in another year the industry would progress sufficiently to supply the local demand for the fruit. The business of orange culture in Cuba is almost entirely in the hands of Americans. Other important crops are cacao, which is carried on chiefly in the province of Oriente and is rapidly extending; pineapples, of which 957,412 crates were exported through the port of Havana during the first six months of 1908; cocoanuts, bananas, coffee, corn, sweet potatoes, and hemp. On June 30, 1907, there were in Cuba, 2,584,877 head of cattle, 413,937 horses, 50,637 mules, and 2810 donkeys.

FOREIGN COMMERCE. The total imports in the fiscal year 1907-8 were valued at \$96,993,134, and the total exports, \$97,449,917, against \$96,668,889 and \$110,764,937 respectively in 1906-7. The imports and exports of specie in 1907-8 were \$1,835,787 and \$14,675,020 respectively, against \$66,306 and \$4,047,909 respectively in 1906-7. The trade with the principal countries for these two years was as follows:

From and to	Imports		Exports	
	1907-8	1906-7	1907-8	1906-7
United States	\$46,460,908	\$48,192,672	\$81,338,327	\$98,141,012
Other American countries	8,346,912	9,500,962	2,726,006	2,211,504
Germany	7,762,761	6,433,969	3,734,394	3,130,757
Spain	8,816,910	8,286,973	1,006,029	413,306
France	5,854,474	5,781,608	1,938,427	1,002,329
United Kingdom	14,550,912	13,639,130	5,143,571	4,446,223
Other European countries	3,578,580	3,434,585	868,179	821,672
Other countries	1,163,778	1,398,996	692,984	508,135

According to the United States returns for the fiscal year ending June 30, 1908, the total imports from Cuba were valued at \$83,284,692, and the total exports to Cuba, \$47,161,306. The values of the leading imports from Cuba were: Sugar, \$58,320,582; leaf tobacco, \$13,041,060; cigars, cigarettes, and cheroots, \$4,163,269; iron ore, \$2,275,625; mahogany and other cabinet woods, \$693,840; bananas, \$872,272. The values of the leading exports to Cuba were: Corn, \$1,230,241; wheat flour, \$3,554,000; coal, \$2,152,130; coffee, \$1,468,347; cotton manufactures, \$1,585,196; eggs, \$911,612; iron and steel manufactures, \$8,183,119; boots and shoes, \$2,577,966; meat and meat products, \$6,163,601; milk, \$905,068; mineral oil, \$999,903; vegetables, \$1,021,743.

COMMUNICATIONS. In 1906-7 the ports were entered by 4294 ocean-going vessels of 9,852,115 tons, and 13,278 coasting vessels of 3,068,815 tons. The merchant marine in 1907 consisted of 63 steamers of 47,118 tons, and 211 sailing vessels of 18,107 tons. The length of railway in 1908 was 1897 miles. On February 14, 1908, the Provisional Governor decreed the appropriation of \$1,007,750 towards the repair and extension of highways, roads, and bridges.

GOVERNMENT. Since the resignation of President Palma on September 28, 1906, the island was under the provisional government, headed first by Secretary W. H. Taft, and later by Governor C. E. Magoon (see *History*). On November 14, 1908, José Miguel Gomez was elected President of the Republic.

FINANCE, ETC. The budget for the fiscal year 1907-8 estimated the revenue and expenditure at \$25,466,325 and \$23,309,539 respectively, and for 1908-9 at \$29,415,163 and \$24,285,303 respectively.

For the latter year the revenue from customs was estimated at \$24,245,705; internal revenue, \$778,800; posts and telegraph, \$860,872. The estimated expenditure included \$10,877,706 for administration, \$3,431,900 for finance, \$4,275,794 for public instruction, \$3,257,878 for public works, and \$1,289,095 for justice.

ARMY. The military forces in Cuba during 1908 consisted of a part of the United States army known as the "Army of Cuban Pacification." The effective strength on June 30, 1908, was 6088 officers and men, of which there were 328 officers and 4839 men of the army and 51 officers and 827 men of the marine corps. The native army of Cuba consisted of about 5000 men of the Rural Guard and Cuban artillery.

HISTORY.

The most important events in 1908 in the history of Cuba, and indeed the most important and significant since the establishment of the Provisional government on September 29, 1906, were the elections held on August 1, and November 14. These were taken to be the crucial test of the Provisional government and of the preparedness of the Cuban people for self government. As a preliminary to these elections and the establishment of self government for the island, it had been decided in 1907 that a census should be taken. The date fixed was September 30, 1907, and the census was completed on November 14. The work of compiling and copying the results was carried on in the early part of 1908 and by the end of March it was completed. It was found that the number of persons entitled to vote at the elections was 419,342 out of a total population of 2,048,980. These elections were the essential part of the plan of the

American government to end the Provisional government and turn the island over again to the Cuban people. On January 13, President Roosevelt made an order declaring that the Provisional government would terminate not later than February 1, 1909. The date was afterwards officially designated as January 28, 1909, a date sacred to Cuba as being the anniversary of the birth of José Martí, the apostle and martyr of Cuban independence.

ELECTORAL LAW. The law under which the elections were conducted was promulgated on April 1, 1908, and again on September 11, 1908, with modifications which were made necessary by experience during the election on August 1st. The law was characterized by three distinguishing features: First, the system of permanent electoral boards, charged with the conduct of elections. Each municipality has a municipal electoral board of three members; each province a provincial electoral board of five members, and in addition there is a central electoral board in Havana, composed of five members, of which there are two political members representing the two leading political parties; the non-political members are officials of the judiciary, or delegates of the high schools or of the University. Second, the system of registration, which is not voluntary, but contemplates the keeping by the electoral boards of lists of persons in Cuba entitled to vote. The basis for such lists was obtained by means of the population census of 1907 and the lists are subject to correction by the boards throughout the year. Third, the system of proportional representation, according to which the parties are entitled to membership in the bodies to which the system is extended in proportion to the number of votes polled by each party. The constitution of Cuba grants the right of suffrage to every male citizen in the full enjoyment of his civic rights. This admits to the electorate a large proportion of illiterates.

The Electoral Commission considered the desirability of establishing guarantees with reference to this ignorant vote, but it was deemed inadvisable that such distinction should be made. In regard to the suffrage of aliens, a compromise was effected under which aliens, while not permitted to vote, were made eligible for election to the office of municipal councilman. Foreigners were also made eligible in the municipal law for appointment as associate members of the municipal council committees.

POLITICAL PARTIES. The early part of 1907 saw the creation of the Conservative Party on the ruins of the old Moderate Party, and the division of the Liberal Party, which had carried on the revolution of 1906 that culminated in the establishment of the Provisional government. The split in the ranks of the Liberal Party was caused by the rival candidacy of Senator Alfredo Zayas and Major General José Miguel Gomez for the presidential nomination, and the two wings were commonly known as the *Zayistas* and *Miguelistas*. Each claimed to constitute the original Liberal Party and characterized the other branch as a dissident faction; each perfected its organization, the *Miguelistas* designating themselves by the name of Historic Liberal Party, while the *Zayistas* clung to the name of Liberal Party. The Conservative Party resolved to make no nomination for President or Vice-President until after the municipal elections. The National Independent Party, also organized locally, but soon cast its lot with the *Zayistas*. There were, in addition,

several local fusion and independent tickets. In the provincial elections, three of the recognized political parties, the National Conservative, the Liberal and the Historic Liberal, nominated provincial tickets. In addition, there were independent provincial tickets in three provinces. The Conservative Party nominated municipal tickets in all but two of the 82 municipalities. The Liberal Party had municipal tickets in 67 of the municipalities and the Historic Liberals made nominations in 69 municipalities.

CAMPAIGN AND CANDIDATES. The campaign for provincial and municipal elections was carried on in the most orderly manner and would have done credit to any country. There was no discussion of platforms or of differences of principles, but the campaign was based entirely on the records of the parties and the personality of the candidates. Notwithstanding the enthusiasm which prevailed, the general tone of the campaign speeches was marked by a moderation for which party leaders, local as well as national, deserve high credit. This preliminary election offered a measure of strength between the Liberal factions and the result made the advantages of fusion patent. A compromise between the factions was effected and the combined party continued under the name of the Liberal Party. General José Miguel Gomez, who had led the wing which developed the greatest strength, was recognized as the presidential nominee of the party. The vice-presidential candidate of the *Miguelistas* resigned and Senator Alfredo Zayas, the leader of the other wing of the Liberal Party, was made the party's nominee for Vice-President. The posts of senators and representatives were also proportionately distributed. The Conservative Party nominated General Mario Menocal for President and Dr. Rafael Montoro for Vice-President.

General Gomez, the nominee of the Liberals for President, who distinguished himself in the Cuban War of Liberation against Spain, in which he attained the rank of major general, and has since been prominent in political affairs, was a member of the Cuban Constitutional Convention, Governor of Santa Clara Province, and was presidential candidate of his party against Estrada Palma in 1905. Dr. Zayas, the vice-presidential candidate, is a lawyer of recognized ability. He was one of the most active conspirators against Spain and was confined by the Spanish government in an African prison on account of his activities. Later he was a delegate to the Cuban National Convention and a member of the Cuban Senate. In 1905 he was the Liberal candidate for Vice-President. General Menocal, candidate of the Conservative Party for President, was one of the youngest major generals of the Cuban Army in the War of Liberation against Spain. He is an engineer, a graduate of Cornell University and manager of one of the largest sugar plantations in Cuba. In Spanish times he was Cuban Deputy of the Spanish Cortes, and Secretary of State in the government of autonomy which Spain gave Cuba in her efforts to stop the insurrection. In recent years he has been Cuban Minister to England and Germany.

RESULTS OF THE ELECTIONS. The provincial and municipal elections, held on August 1st, were characterized by the same order which prevailed during the campaign. The entire vote cast was 269,132, or about 60 per cent. of the number of votes registered. Returns from the

provinces showed that the Conservatives had elected their candidates for governor in the provinces of Pinar del Rio, Matanzas, and Santa Clara; the Liberals in the provinces of Camaguey and Oriente. In the 82 municipalities the Conservatives elected 28 mayors, while the Historic Liberals elected 35, and the Liberals 18. The results of the election were quietly accepted by all parties and the charges of fraud and intimidation, which had been so general in the previous elections, were conspicuous by their absence. It was universally conceded that no fairer election had ever been held. The elections of November 14 passed off as quietly as those of August 1. The independent vote proved to be a negligible quantity and the election may therefore be regarded as a fair test between the Conservatives and the Liberals. The result of the votes was as follows: Liberal, 201,199; Conservatives, 130,256; or a Liberal majority of 70,943. The total vote cast in the election was 331,455. The Liberals carried each of the six provinces, but obtained the largest majorities in Havana, Santa Clara and Oriente provinces. The Liberal candidates for President and Vice-President, General Gomez and Senator Zayas, were assured therefore the entire 107 electoral votes in the various presidential electoral assemblies when they should be convened. Under the rules of proportional representation, the Conservatives elected 32 members of the Lower House of Congress and the Liberals 51.

ASSUMPTION OF OFFICE BY LOCAL OFFICIALS. On October 1st the newly elected Provincial Governors and Councils, and Municipal Mayors and Councils entered upon office, and on the same date the new provincial and municipal laws provided by the Advisory Electoral Commission were put into effect. The occasion marked an important step toward the restoration of the government of the Republic to the Cuban people. It was also an occasion of special moment to the Cuban municipalities, for, owing to the failure of the Cuban Congress to make the necessary provisions, or to enact a municipal law, the Mayors and Municipal Councilmen who took their seats on October 1, 1908, were the first town officials elected by the people since the municipal election held by the Military government in 1901. Since that time vacancies have been filled by the Councilmen themselves or by the national government and the bitterness engendered by real and alleged irregularities in the making of such appointments was a potent factor in the insurrection of 1906.

CESSATION OF PROVINCIAL GOVERNORS AND COUNCILS. From the beginning of the Provincial administration insistent demands had been received from all elements of the Liberal Party for the removal of the Provincial Councils elected at the 1905 elections. Under the law the Provincial Governors and Councilmen hold office for four years, and one-half of the Council is renewed every two years. One-half of the Council in office had been elected in 1903 and had taken their seats in 1904. The other half of the Provincial Council had been elected in 1905 and had assumed office in 1906. It was against the latter that criticisms were directed in view of the illegalities with which their election was tainted, but the necessities of local government made necessary their temporary retention. On April 6, 1908, the term of the Councilmen elected

in 1903 expired, leaving in office only those elected in 1905, not enough to constitute a legal quorum to do business. The requests for cessation increased with the approach of the elections and in order to obviate possible embarrassment and avoid the suspicion that the influence of the National government was used to benefit any particular party, it was considered advisable that the offices be vacated. The seats of the second half of the Provincial Councilmen were therefore declared vacant and the powers of the Provincial Councils temporarily vested in the Provisional government. The resignation of the Provincial Governors was requested and accepted. For the vacancies created by the retirement of the Provincial Governors officers of the United States army were appointed Acting Provincial Governors to hold office at the pleasure of the Provisional government until the installation of the governors chosen at the Provincial elections. The American officers so appointed continued to act until October 1, 1908, when the officials chosen at the election of August 1st entered upon office.

LEGISLATIVE CONDITIONS. Since the establishment of the Cuban Republic, the urgent necessity of the revision of the laws of Cuba has been continually felt. The great body of the Cuban law consists of provisions enacted for the Spanish Peninsula, subsequently extended to Cuba and later modified and amended by Royal Orders and Decrees, orders of the Military government established by the United States, laws of the Cuban Congress and decrees of the Provisional Governor. Being laws provided for the country under a monarchical government, they are, in general, not in harmony and often quite at variance with the precepts of the extremely liberal constitution of the island. The Cuban Congress failed to make adequate response for the demand for legislation under the Constitution. The lack of proper legislation was felt, particularly with respect to the municipal law. After the adoption of the Constitution, the municipalities continued to be governed by the Spanish Provincial municipal law of January 28, 1878. This law gave the central government supervising control over the municipalities and was, therefore, in conflict with the spirit and letter of the Constitution, which grants the municipalities an unusual measure of autonomy. The efforts of the national authorities to enforce the municipal law in the absence of other provisions engendered animosities which contributed to the insurrection of 1906. Upon the establishment of the Provisional administration, provision was made for the execution of the legislative programme contained in the plan promulgated by the American Peace Commission in its negotiations carried on between the contending forces in September, 1906. It was known as an Advisory Commission and is composed of nine Cubans prominent in public life representing the several political parties, and three Americans. The Commission was first charged with the drafting of an Electoral Law, a Municipal Law, a Provincial Law, a Law organizing the Judiciary, and a Civil Service Law. This programme was afterward extended to include other necessary laws. The provisions of the Electoral Law are noted above. The Organic Municipal Law was promulgated on May 29, 1908, and was put in force on October 1, 1908. Its distinguishing feature is that it represents an attempt to organize a municipal government in harmony with the Cuban Constitution. The Provincial Law

took effect also on October 1, 1908. This law takes the place of the Spanish law of the Provinces. It provides for the entire reorganization of the provincial governments and is drafted to accord with the provisions of the new Organic Municipal Law. The Judiciary Law was not promulgated, but was published for public criticism, and the observations deemed acceptable were incorporated in the project by the Commission. The Civil Service Law, too, was not promulgated, but in December, 1908, a final draft was being prepared for submission to the Provisional Governor. In its general plan the project follows the lines of the Civil Service Law of the United States. Among other important laws with which the Commission was charged with drafting were the Law of Executive Power, the Law of Armed Forces, the Code of Military Justice, a Drainage and Irrigation Law, a Telephone Law, a Notarial Law, and a Game Law. The Commission was at work during the year on the revision of the penal code and new reforms in the granting of pardons.

LAW AND ORDER. The conditions of law and order on the island during the year were most gratifying. This was due, in a large measure, to the services of the Rural Guard, which, during the administration of the Provisional Government, has been put in a high state of efficiency. At the time of the establishment of the Provisional administration, the Rural Guard was found to be in a demoralized state and regarded with disfavor and suspicion by the public on account of having been used as a political agency. A number of United States officers were detailed to serve with the Guard, and largely through their efforts the personnel and spirit of the body was improved. One of the most important services rendered by this force was the complete suppression of brigandage which, for centuries had been a menace to peaceful conditions on the Island. Several bandits were captured and sentenced to long terms of imprisonment in 1908.

OTHER EVENTS. Action was taken during the year on the option held by the State on certain property belonging to the Catholic Church in the Province of Santiago de Cuba. This property was part of the estates belonging to monastic institutions and confiscated by the Spanish government. The State, in lieu of returning the property, made annual appropriations to the clergy, but when such appropriation ceased on the separation of Church and State in 1899, the claim made by the Church to such of its properties as were still in the possession of the government was recognized as valid. Part of the property was therefore purchased outright by the State and options secured on the remainder. The Cuban Congress failed to act in the matter and these options were extended by agreement to June 30, 1907. One of them was upon certain property in the City of Havana, occupied by the Havana Customs House and other public offices, and the purchase was effected by the State on July 12, 1907. The other was for property in the Province of Santiago and the option thereon was, in July, extended for one year, to June 30, 1908. The lump sum at which the Church agreed to sell the Santiago property was \$535,000 and during the entire period that the option ran, the State paid annually to the Church as rent for this property a sum equal to 3 per cent. of the option price. The Church authorities declined

to extend the option on the property for the third time and an investigation was carried on as to the advisability of taking advantage of the option or returning the property to the Church. The value of the property was found to be \$360,900 and an offer was made to purchase for \$210,000 such part of the property as was needed for public service or was settled by Cuban veterans, or, if the Church found this unacceptable, to purchase the entire property for \$360,900, or otherwise to return the property and acquire by condemnation such portions as were urgently needed by the State. The Church agreed to the second plan for purchase, and the purchase was carried into effect on July 18, 1908.

Tomas Estrada Palma, first President of the Republic, died on November 4, 1908. Other distinguished patriots who died during the year were Generals Bernabe Boza, March 17, and Rafael Portuondo, July 15. Both had been brigadier generals in the War of 1895-98. The former was a member of the Cuban Congress at the time of his death, and the latter was Speaker in the first House of Representatives of the Cuban Republic.

CULBERTSON, JAMES COE. An American physician, died on June 4, 1908. He was born in Miami County, Ohio, on December 19, 1840, and graduated at the Bellevue College Hospital in 1865, having served as a private in the Fifth Ohio Infantry in 1861, as a hospital steward in 1862, and as an assistant surgeon, in the One Hundred and Thirty-seventh Ohio Volunteer Infantry, in 1864. After the war he practiced medicine in Cincinnati, was editor and publisher of the Cincinnati *Lancet-Clinic*, after 1873; editor of the *Journal of the American Medical Association* in 1891-93, and professor of the principles and practice of medicine in the Cincinnati College of Medicine and Surgery after September, 1893. He was an active promoter of the University of Cincinnati, and secured the passage of the ordinance conveying to that institution the sixty-acre tract of land whereon its buildings now stand. He was also an active member of the Cincinnati Board of Education, from May 1, 1896, and as such persistently and successfully advocated the establishment of public playgrounds, free bathhouses and other public improvements.

CULLINAN DIAMOND. See DIAMONDS.

CULLINGWORTH, CHARLES JAMES. An English physician, died on May 11, 1908. He was born in Leeds, on June 3, 1846, was educated at Wesley College (1863-67), and at the Leeds School of Medicine (1861-65), and began to practice in 1865. After some general practice he specialized in the diseases of women and in 1873-88 was surgeon to St. Mary's Hospital for Women, in Manchester. In 1888-1904 he was obstetric physician at St. Thomas's Hospital, in London, the gynecological department of which reached a high degree of efficiency under his direction. He also served as examiner at the University of London in 1890-95, and at the University of Cambridge in 1896-1900; was president of the Obstetrical Society, of London, in 1897-98; Bradshaw lecturer, at the Royal College of Physicians in 1902, and Ingleby lecturer at the University of London in 1904. His writings, which display much literary taste, include *Oliver Wendell Holmes*, and *the Contagiousness of Puerperal Fever*, the purely bio-

graphical features of which are noteworthy; *Charles White, a Great Provincial Surgeon and Obstetrician of the 18th Century*, and contributions to Allbutt and Playfair's *System of Gynaecology*.

CUMBERLAND PRESBYTERIAN CHURCH. A religious denomination, organized in 1810. A movement was begun in 1903 to merge the United Cumberland Presbyterian with the Presbyterian Church in the United States of America. This effort culminated in 1906 in the vote of the majority in the Cumberland Assembly to adjourn sine die as a separate Assembly. A large majority of those commissioners who opposed the proposed union, emphasized their protest by continuing, as they claimed, the work of the Cumberland Assembly, thus ignoring the majority vote. It is claimed by those who voted for the union that the church had been merged with the Presbyterian Church of the United States of America, and that the Cumberland Presbyterian Church, as it was composed prior to 1906, does not exist. That body which refused to accept the union, on the other hand, claimed that the Cumberland Presbyterian Church was not a new organization but was a continuation of the same church, organized in 1810, notwithstanding the exit of nearly one-third of its membership and two-thirds of its preachers, who joined the Presbyterian Church of the United States of America.

Litigation was being carried on in 1908 to determine the disposition of the property involved. During the year, five suits were decided, four of these being in favor of the Cumberland Presbyterian Church and one practically in favor of neither party inasmuch as the court held that in the form the suit appeared before them there were no property rights to be passed upon. These suits were as follows: One in Kentucky lower courts in favor of the Cumberland Presbyterian Church; two in Indiana lower courts in favor of the Cumberland Presbyterian Church; one in the Texas Appellate Court, and one in the Illinois Supreme Court practically in favor of neither party as stated above. About 100,000 communicants and 600 preachers remained in adherence to the Cumberland Presbyterian Church. Successful meetings were held during the year and accessions were made in larger numbers than before the disruption caused by the union movement. The 78th Cumberland Presbyterian General Assembly convened at Corsicana, Texas, on May 21, with a representative attendance. A denominational Young People's Society was organized during the year.

CUMMINS, ALBERT BAIRD. An American politician, United States Senator (Republican) from Iowa. He was born at Carmichaels, Pa., on February 15, 1850, received an academic education at Waynesburg, Pa., and then took up surveying and was made chief engineer of the Cincinnati, Richmond & Fort Wayne Railroad. He also studied law and was admitted to the Illinois bar in 1874, beginning his practice in Chicago. In 1878 he went to Iowa and ten years later was elected to the State Legislature. He was an unsuccessful candidate for United States Senator in 1894. From 1896 to 1900 he served on the Republican National Committee. He was elected governor in 1902 and re-elected in 1904 and 1906. In 1908 he was the candidate of the tariff-revision faction of his party for the United States Senate against William

B. Allison, who represented the "standpatters," but was defeated in the primaries. Upon the death of Senator Allison, however, he again entered the field and on November 24 was elected Senator by the Legislature. Senator Cummins was for a time prominently mentioned for the Republican vice-presidential nomination in 1908. See IOWA.

CURACAO. A Dutch colony of the West India islands, including the islands of Curaçao, Buen Ayre, Aruba, the southern part of St. Martin (the northern belonging to France), St. Eustache, and Saba. Total area, 436 square miles; total population, 53,376 in 1906. Willemstad, the capital, on the island of Curaçao, had 13,836 inhabitants in 1906. The products are mainly sugar, tobacco, corn, and fruits. Gold and phosphate of lime are worked in Aruba. The imports and exports of the island of Curaçao in 1906 amounted to 3,152,000 and 493,000 florins respectively (1 florin equals 40.2 cents). The trade of the Dutch West Indies is mainly with the United States, the imports from which (according to the U. S. returns) in 1907-8 amounted to \$706,210, and the exports to them, \$361,966. The revenue and expenditure for 1908 were estimated at 566,615 and 915,903 florins respectively, the deficit being covered by the Netherlands. There is a garrison of 205, and a Dutch naval vessel is always cruising in adjacent waters. The Governor in 1908 was Jkhr. J. O. de Jong van Beek en Donk. On May 14, 1908, President Castro of Venezuela issued a decree that all goods hitherto transshipped at Willemstad should henceforth be transshipped at Puerto Cabello. A large part of the trade of Curaçao was thus disorganized. A demonstration by a mob against the Venezuelan consul at Willemstad resulted in his withdrawal from the island, and a boycott against Venezuelan goods was instituted by the merchants. See NETHERLANDS AND VENEZUELA.

CURLING. The International match for the Gordon Medal was held at Montreal on February 7, Canada being represented by the Lachine Curling Club and the Royal Caledonian Curling Club, and the United States by the Grand National Curling Club and the Utica Curling Club. Canada won by the score of 49 to 28. Other important matches were: Gordon Medal Match, Boston, January 30, won by the Thistle Curling Club; North against South of Scotland, Van Cortlandt Lake, N. Y., January 11, won by North; Match for Silver Cup, presented by Utica Curling Club, Van Cortlandt, N. Y., February 12, won by the Utica Curling Club; Mitchell Medal Match, Van Cortlandt, N. Y., January 28, won by J. F. Conley, of the Grand National Curling Club. In Canada the Victorian Jubilee trophy was won by the Montreal Club; the Governor-General's prize by the Rideau Club; and the Montreal A. A. A. trophy by the Montreal Club.

CURRENCY. Following the outbreak of the financial panic in Oct., 1907, the demand for a law providing for a more elastic currency became very insistent. The crisis once more impressed upon the country the inability of the national banks, the sole banks of issue, to expand their circulation at a time of extreme money stringency. The authorized means at the disposal of the national government of increasing the money in circulation in times of temporary stringency were very limited, except as resort

was had to the extra-legal means of loaning government money to the banks free of interest. While almost one-fourth of a billion dollars was thus used in the 1907-8 stringency, with highly beneficial results, the United States Treasury could not be relied on for support at all times. Numerous schemes for reform were proposed. Some proposed a central United States bank with sole power to issue bank notes; others proposed the issue of emergency notes by national banks meeting certain standards, such notes to be based either on the general assets and credit of the bank, or upon approved securities deposited with the Treasury; still others advocated a complete overhauling of the monetary system including a retirement of greenbacks, treasury notes and silver certificates. The scheme finally adopted by Congress, providing only for an emergency currency without attempting a general reform of the banking and monetary systems, was incorporated in the Aldrich-Vreeland Act, approved May 30.

The provisions of the new law are as follows:

(1) Any national bank with unimpaired capital, having bond-secured circulation of not less than 40 per cent. of its capital and a cash surplus of not less than 20 per cent. of its capital, may secure additional circulation; (2) the Comptroller of the Currency, the Treasurer of the United States, and the Secretary of the Treasury are authorized to determine whether conditions require the issue of emergency circulation, to fix time and amount of issue, and to pass on security offered as the basis therefor; (3) the total circulation issued by any bank shall not exceed its capital and surplus and the total amount issued by all shall not exceed \$500,000,000; (4) the emergency notes shall be guaranteed by the government, and shall be similar in character to present national bank notes; (5) they shall, however, bear a graduated tax of not more than 10 per cent. per annum, to insure their speedy retirement when the serious need for them ceases; (6) there shall be deposited in the Treasury lawful money equal to 10 per cent. of the emergency notes as a fund for the redemption of the notes of failed banks. The law provides two ways in which a national bank may secure emergency circulation, all the foregoing provisions applying to either method. The first method is through a national currency association and the second is directly. The law authorizes the formation of a national currency association by not less than ten national banks fulfilling the qualifications noted above, whose aggregate capital and surplus amounts to \$5,000,000. Such banks must be from contiguous territory, only one association may be formed in the same city, and no bank may belong to more than one association. Any member bank may deposit with its currency association, in trust for the United States, State, county, city, town, or other municipal bonds of designated character; the bank will receive from the Comptroller of the Currency, through its association, emergency notes equal to 90 per cent. of the market value of such bonds. Moreover, a bank may deposit with its association two-name commercial paper of not more than four months time and representing actual business transactions and receive emergency notes equal to 75 per cent. of their cash value; the notes based on commercial paper shall not exceed 30 per cent. of the bank's capital and surplus. The law makes the members of the currency associa-

tion jointly and severally liable for the redemption of emergency notes issued to any member bank. By the second method of obtaining additional notes, a bank deals directly with the national authorities. Any qualified national bank may deposit with the Treasury State, county, city, town, or other municipal bonds, but not commercial paper; if these are approved, the comptroller issues directly to the bank notes equal to 90 per cent. of their market value, but not more than their face value. Bonds acceptable are those of civil bodies that have not defaulted in ten years and whose net debt does not exceed 10 per cent. of assessed valuation. This law further authorized a National Monetary Commission, to be composed of nine senators and nine representatives, to investigate the monetary system and the banking and currency laws of the United States, and to report to Congress any changes deemed desirable. This commission was given wide discretion in the calling of witnesses and in making inquiries in this country and abroad. During the summer and fall of 1908 this commission studied conditions at home and in Europe, but no report is expected from it before 1910. All the provisions of this statute expire by limitation June 30, 1914.

As the provisions of this law were intended for use only in times of financial stress, it seems improbable that they will be called into use during the six years authorized. At the close of the year only one currency association, that at Washington, D. C., had been formed. Some bankers have complained that the high tax on the emergency notes (5 per cent. annually the first month and increasing by one per cent. each month until 10 per cent. is reached) would not permit them to make a profit. In reply it is urged that banks are not expected to make a profit, but should be willing to pay something for such a safeguard against bankruptcy in times of panic as the law provides. The provision for the issue of notes on the basis of two-name commercial paper is expected to be of especial advantage to farmers and merchants, if the law is called into use. One undoubted advantage derived from the enactment of this law, and the discussion attending it, is the education of public opinion in the merits of an elastic currency and the soundness of a currency based on securities other than national bonds.

During the fiscal year 1908 a new model for gold coins, designed by the eminent sculptor, Augustus St. Gaudens, was brought into circulation. There were coined from the new designs \$105,939,360 in double eagles and \$4,829,060 in eagles. Another departure in coinage begun at the Philadelphia mint in Nov., 1908, was the use of a die which depresses the design below the face of the coin instead of raising it in relief above. This places the wear of the coin on the flat surface and not on the design and permits the coins to be easily stacked to a uniform height for counting. For the first time the records permit an accurate estimate of the cost of coining metal money. The average cost for one thousand coins was found to be \$29.51 for double eagles, \$13.93 for half-eagles, \$9.80 for half dollars, \$5.93 for quarter-dollars, \$2.53 for dimes, \$2.11 for five-cent pieces, and \$1.12 for pennies. The motto "In God we trust" was omitted from the new gold coins adopted early in the fiscal year, but on May 18 Congress required its restoration within thirty days.

The amount of money in circulation at the opening of the year, as estimated by the Treasurer of the United States, was \$3,078,989,000, a sum never before equalled. The amount increased slightly during January, after which it decreased until near the close of July. During August it rose again to the level of Jan. 1. On Dec. 1 it reached a new maximum of \$3,117,561,000, but fell to \$3,092,315,000 on Jan. 1, 1909. The per capita circulation on the latter date was estimated at \$35.06, as compared with \$34.72 on June 30, 1908, and \$32.22 on June 30, 1907. The amount in circulation on the second day of November was distributed as follows: Gold coin (including bullion in the Treasury), \$610,060,562; gold certificates, \$807,246,389; standard silver dollars, \$74,740,245; silver certificates, \$483,899,842; subsidiary silver, \$131,663,701; Treasury notes of 1890, \$4,691,225; United States notes, \$342,994,056; national bank notes, \$643,202,001. As compared with Nov. 1, 1907, gold certificates in circulation increased by \$129,950,480; national bank notes by \$48,078,135; and gold by \$35,601,476; while silver dollars decreased by \$14,082,714 and treasury notes by \$910,701.

There were 266,306,572 pieces of paper currency in circulation on Oct. 1, 1908. All of these must be redeemed and replaced when worn. It has been found that the average lifetime of United States paper currency varies from 1.5 years for silver certificates to 3.6 years for greenbacks and national bank notes. The aggregate cost of maintaining the paper money in 1908 was \$2,932,000, or an average of \$.01571 for each note issued and redeemed. See CLEARING HOUSES and NATIONAL BANKS.

According to the estimate of the director of the United States Mint, the total stock of money in the world on Jan. 1, 1908, was \$14,847,800,000, an increase of \$567,800,000, as compared with Jan. 1, 1907. The stock of gold money Jan. 1, 1908, was estimated at \$7,014,600,000, an increase of \$122,800,000 during 1907. The silver money was estimated at \$3,530,700,000, as compared with \$3,256,300,000 one year previous. The aggregate uncovered paper money was estimated at \$4,302,500,000, or \$170,500,000 more than one year earlier. The distribution by leading nations was as follows, figures being given for thousands of dollars, except in the last column, which gives the estimated amount of money per capita:

Country	Gold	Silver	Uncovered paper	Amount per capita
United States.....	\$1,612,700	\$715,000	\$779,500	\$35.79
Austria-Hungary	303,100	104,200	131,400	10.79
Belgium	30,800	38,100	129,400	24.54
Australia	159,300	10,000	(a)	35.27
Canada	66,300	6,700	61,200	22.37
United Kingdom.....	564,500	116,800	117,400	17.90
India	113,200	830,000	38,900	3.32
France	926,400	411,100	261,400	40.68
Germany	1,044,400	223,500	277,100	25.49
Italy	258,200	41,600	160,400	13.65
Japan	95,800	54,400	103,700	4.85
Russia	917,300	78,100	(a)	6.94
Spain	87,800	173,700	99,100	18.39
Argentina	139,800	(a)	239,600	63.23

(a) No information.

CURTIS, ALFRED ALLEN. AN American Roman Catholic bishop and Vicar-General of Baltimore, died on July 11, 1908. He was born in Somerset County, Md., on July 4, 1831; in

1856 was ordained a deacon in the Protestant Episcopal Church, and in 1859 was advanced to the priesthood in that church. For nearly ten years he was rector of Mount Calvary Church, Baltimore, but in 1870 resigned from the Episcopal Church and two years later was received into the Roman Catholic Church. In 1874 he was ordained priest and was appointed assistant at the Baltimore Cathedral and private secretary to the archbishop. He was consecrated Bishop of Wilmington, Del., in 1886 and ten years afterward was made resident bishop, also receiving the titular see of Edinus. He served as bishop administrator of Wilmington until 1892. In 1898 he was appointed vicar-general of Baltimore by Cardinal Gibbons, which position he filled until a few days before his death.

CUTCHEON, BYRON M. An American soldier and politician, died at Ypsilanti, Mich., on April 12, 1908. He was born in Pembroke, N. H., on May 11, 1836, removed to Michigan in 1857 and in 1861 graduated at the University of Michigan. He joined the Twentieth Michigan volunteers as a second lieutenant in 1862, and rose to be colonel of that regiment and later of the Twenty-seventh Michigan, and brevet brigadier general of volunteers. He was twice wounded at Spottsylvania and received the Congressional Medal of Honor for gallantry in battle. After the war he was active in Republican politics in Michigan for many years and was a member of Congress from 1883 to 1891.

CYCLING. New professional records were made in 1908 by A. J. Clarke, F. L. Kramer, and John Bedell. Clarke rode the half-mile, unpaced, against time, in 50 2/5 seconds, and the half-mile handicap in 51 1/5 seconds; Kramer rode the one-third mile handicap in 38 seconds, and the 25-mile competition in 57 minutes, 26 3/5 seconds; and Bedell rode 10 miles in competition in 20 minutes, 4 3/5 seconds. In professional tandem competitions (flying start), Kramer and Folger covered one mile in 1 minute and 51 seconds and two miles in 3 minutes, 46 2/5 seconds, and Mayer and Clarke covered five miles in 9 minutes, 50 3/5 seconds. The professional sprint championship was won by F. L. Kramer, who scored a total of 20 points. W. A. Bardgett was second, with 11 points. Hugh McClean won the professional paced championship with a total of 110 points, James F. Moran being second with 50 points. The 100-kilometre world's professional paced championship, held at Berlin, Germany, Aug. 2, was won by F. Ryser, whose time was 1 hour, 22 minutes, 3 seconds. The record for this distance, 1 hour, 34 seconds, was made by A. E. Wills, at Munich, Aug. 17, 1908. The six-day race, held in New York, in December, was won by MacFarland and Moran. Three teams, MacFarland-Moran, Rutt-Stol, and Hill-DeMara, were tied for first place, and a mile sprint was necessary to decide the winner. In this sprint MacFarland finished first, Rutt second, and DeMara third. The distance covered, 2,737 miles, 1 lap, broke the record of 2,733 miles, 4 laps, made by Miller and Waller in 1899. The twentieth annual twenty-five mile Irvington-Milburn road race was won by George Lockner, of Syracuse, N. Y., with a 4 1/2 minute handicap. In amateur competition, unpaced, P. Lawrence established a record for two miles of 3 minutes, 53 2/5 seconds, and H. McCormick made a record in the five-mile of 10

minutes, 31 seconds. Other new amateur records, all of which were made against time, were: $\frac{1}{4}$ -mile, 24 $\frac{4}{5}$ seconds, A. Crebs; $\frac{1}{2}$ -mile, 53 $\frac{1}{5}$ seconds, P. Lawrence; $\frac{3}{4}$ -mile, 1 minute, 23 $\frac{3}{5}$ seconds, P. Lawrence; 1-mile, 1 minute, 55 minutes, P. Giles; 2-mile, 4 minutes, 9 seconds, Giles; 3-mile, 6 minutes, 25 $\frac{3}{5}$ seconds, Giles; 4-mile, 8 minutes, 51 $\frac{2}{5}$ seconds, Giles; 5-mile, 11 minutes, 9 seconds, Giles. The amateur sprint championship was won by C. H. Stein, with 17 points; F. Hill being second, with 10 points.

CYPRUS. The third largest island in the Mediterranean, 60 miles from the coast of Asia Minor, 38 miles from the coast of Syria, and 238 miles from Port Said, at the entrance of the Suez Canal. Area, 3584 square miles. Population (1901), 237,022, including 182,739 Greek-Christians, 51,309 Mohammedans, and 2974 Armenians, Maronites, and members of other sects; in 1907, it was estimated at 249,250. The population of the principal towns in 1901 was: Nicosia, the capital, 14,752; Limassol, 8,298; Larnaca, 7,964; Famagusta, 3,825; Papho, 3,134; Kyrenia, 1,336. In 1906-7 there were 526 elementary schools with 27,049 pupils (5,364 Moslem), besides a gymnasium and high schools. Most of the elementary schools receive government aid. The products in 1906 were: Wheat, 2,384,504 bushels; barley, 2,731,199; oats, 355,002; vetches, 342,579 bushels. Other important products are silk cocoons, cotton, grapes, olives, linseed, carob-beans, wool, cheese, hides, and fruits. The cotton export in 1906-7 was 1,606,505 pounds; in 1907-8, 562,800 pounds. The export of wine in 1907 was 962,672 gallons, mainly to Egypt; of spirits, 49,882 gallons, mainly to Turkey. In 1906 there were 253,138 sheep, 248,439 goats, besides cattle, horses, asses, and mules. Copper and asbestos mines are worked. In 1907 the imports amounted to £702,893 (£194,074 from Great Britain), and the exports, £635,055 (£198,265 to Great Britain). There is a railway from Famagusta to Morphou, 61 miles. The inner harbor of Famagusta was made accessible to steamers in 1906. The island is nominally a Turkish possession, paying an annual tribute of £92,800 and 4,166,220 oke of salt to the Porte (1 oke=2.8 lbs.). The revenue in 1907-8 was £311,810; expenditures, £203,029. The deficit caused by the Turkish tribute is made good from imperial grants-in-aid (£28,000 in 1906-7) and loans. The garrison numbers 123; the police force, 778. The British High Commissioner in 1908 was Sir C. A. King-Harman. Riots having occurred as the result on the appointment of the Bishop of Kyrenia as Archbishop of Cyprus, martial law was proclaimed on April 10. The difficulty arose out of a disputed election and the appointment was very unpopular, but after the proclamation of martial law the trouble soon subsided. At the end of the year agitation for annexation by Greece was reported among the Greeks as a result of the Cretan proclamation of union with Greece.

DAHOMY. A French colony in West Africa, with about 70 miles of coast and an extensive hinterland northwards. In 1907 the districts of Fada, N'Gourma, and Say, comprising about 24,000 square miles, were transferred to the colony of the Upper Senegal-Niger (q. v.). The boundary line from the sea to the Niger, separating it from the British colony of northern Nigeria (q. v.), was determined by the

Anglo-French treaty of Oct., 1906. The area is about 60,000 square miles, and the population (1907), 635,971. The capital and chief trading centre is Porto Novo, 50,000 inhabitants. The principal agricultural products are maize, manioc, yams, and potatoes. In 1907 there were exported 60 tons of cotton. There is a ginning station at Abomey, another at Cotonou, and a third was erected by the Colonial Cotton Association at Savé. The industry is still in an experimental stage. The forests contain baobab trees, cocoanut trees, and oil palms. Palm-kernels and palm-oil are the principal exports. In 1907, imports amounted to 11,655,312 francs, and exports, 9,670,983; in the trade with France imports and exports amounted to 3,200,000 and 3,907,000 francs respectively. In 1908 there were 166 miles of railway open. Telegraphs extend as far as the Niger and Senegal, their length in Dahomey being over 1730 miles. The colony is administered by a Lieutenant-Governor, who is under the Governor-General of French West Africa (q. v.).

DAILEY, PETER F. An American comedian, died on May 23, 1908. He was born in New York City about 1863. In 1876 he appeared as a dancer at the old Globe Theatre, New York City; he then joined a travelling circus, as a clown, and shortly afterwards entered vaudeville. He played with the Howard Athenæum Company in 1878-81; later appeared in *Evangeline*; and for several years played under Augustin Daly's management. After appearing with May Irwin and James T. Powers and in leading rôles, in 1896 he joined Weber & Fields' Burlesque Company, with whom he remained during the next four years. He achieved great success in their burlesques of current plays, becoming especially well known for his peculiar attitude in extemporizing lines and humorous situations. He left Weber & Fields in 1900 to appear under Frank McKee's management, but rejoined them in 1901. Upon the breaking up of the Weber & Fields company in 1905, he was a star for a short time, and then went into vaudeville. In Jan., 1908, he joined Weber's company, and at the time of his death was appearing in Weber's burlesque of *The Merry Widow*.

DAIRYING. The number of milch cows in the United States on Jan. 1, 1909, was 217,000,000, an increase of 526,000 since Jan. 1, 1908. The average price per head in 1908 was \$32.36, in 1907, \$30.67. The total value of milch cows in 1908 was \$702,945,000, as against \$520,880,000 of the previous year. This increase in value was due to the natural growth of the dairy industry and to the improvement of the quality of the cows kept by dairymen. The value of dairy products had been constantly increasing for many years. In 1908 it amounted to nearly \$800,000,000. In some sections of the country dairying was not as profitable in 1908 as in some previous years, for the increase in the price of milk and milk products did not keep pace with the increase in the price of feeding stuffs. According to the report of the Secretary of Agriculture the wholesale milk prices at Chicago and New York, respectively, were 10.5 cents and 10.12 cents per gallon in 1899, 12.24 and 11.76 cents in 1905, 14.375 and 12.886 cents in 1907, and 15.16 and 16.63 cents in 1908. The mean factory price of Elgin butter was 19.66 cents in 1899, 28.5 cents in 1907, and 27.16 cents in 1908. The average price in New York for fancy, large,

colored cheese was 13.53 cents in 1908, and 13.99 cents in 1907.

In the United States there were about 6,000 creameries for butter-making, 5,000 cheese factories, 1,000 combined factories and centralizers, and 150 condensed milk plants. In Canada there were 575 creameries, 1,200 cheese factories, 540 combined factories, and 1,400 syndicates and syndicate factories. During 1908 there were exported from the United States 8,918,091 lbs. of butter, valued at \$1,884,244; 10,190,843 lbs. of cheese, valued at \$1,270,557; and milk to the value of \$1,997,689. During the same period there were imported 261,161 lbs. of butter, valued at \$73,384; 33,793,726 lbs. of cheese, valued at \$5,627,894; and milk valued at \$14,000.

The financial stress in the fall of 1907 affected dairy products much less than it did many other commodities. It reduced consumption to a slight extent, but there was a reduced production, so that prices were comparatively firm. The high price of feeds tended to reduce the profit of the milk producer who does not feed home-grown crops and, though the price of milk was much higher than ten years ago, it costs more to produce it because feed was higher and competent help was hard to get, while State and city health officials had become more exacting and require milk to be produced under sanitary conditions. These conditions were driving some dairymen out of business and caused others to reduce the size of their herds. In some respects this has been a gain to both producer and consumer. The producer in the past had kept too many "boarder" cows that did not produce enough milk to pay for their feed. The high cost of production compelled the dairyman to test his cows and weed out the poorest individuals. In many cases the herd left, though reduced in numbers, was affording the owner a larger profit than before. Again, the producer who had formerly bought a large proportion of his feed, was forced to cast about for crops that could be grown on his own farm, and many a dairyman discovered that at the prevailing prices the profit came from raising the crop rather than in feeding it out.

At the Tennessee Experiment Station it was found that a ton of soy bean hay yields 560 lbs. of beans and 1,440 lbs. of straw, can be produced for \$7.00, and has a higher feeding value for dairy cows than a ton of alfalfa hay which costs \$20-\$25 in the market. Cow pea hay was proved to be a cheap and valuable feed. These and other results obtained at a number of experiment stations demonstrated the advantage of feeding home-grown crops and agreed with the experience of practical farmers.

The consumer of milk, though paying more than formerly, is getting a purer product. Physicians and scientists were arousing public opinion as to the importance of having sanitary milk. It was generally accepted by physicians that tuberculosis was seldom, if ever, contracted by inhaling the bacilli. It is contracted by eating or drinking contaminated food products. Milk containing tuberculosis germs is probably the most common means of spreading this and some other diseases. It was demonstrated that tubercle bacilli will live in butter kept in cold storage under ordinary commercial conditions for 153 days. After remaining in butter 133 days, or in cheese 111 days, they are capable of causing fatal tuberculosis when injected into guinea pigs. Milk exposed to flies has been

found to contain many more gas-forming bacteria than when kept in a covered receptacle. Large numbers of these germs may excite acute diarrhoea in children. The necessity for the proper treatment of milk should be apparent to everyone, but there are still too many careless dairymen. The unsanitary barn and dairy-house, however, seems to be doomed, for the educational campaign for pure milk is driving the ignorant and careless dairyman out of business. The most radical step undertaken occurred in Chicago where every pint or pound of milk or milk products sold after Jan. 1, 1909, must be pasteurized or must come from cows that have successfully passed the tuberculin test.

There was a good supply of low grade dairy products, but there was a constantly increasing demand for first class butter, cheese, and sanitary milk. But it costs more to produce the quality demanded and prices were not thought likely to be as low for many years to come as they had been in the past. The demand for pasteurized milk necessitated some method for determining whether or not the milk had been so treated. Many tests were proposed, among them guaiac, orthol, ursol, methylene blue, formalin and other reagents, but the Storch method of using paraphenyldiamine was the test generally preferred in the United States. All of these methods were based on the fact that the reagents used produce colors when oxydase is present in milk. Heating destroys oxydase and in that case no reaction takes place. New methods have been devised for estimating the leucocyte and bacterial contents of milk. The determination of species of bacteria in milk is difficult, because many species are variable in form and character. The decimal system of recording the reaction of pure cultures of bacteria adopted by the American Society of Bacteriologists simplified this problem. At the experiment station at Geneva, N. Y., this system was used in studying the bacterial flora of cheddar cheese and the "pure cultures fell into their allotted places with mathematical precision."

At a conference called by the Commissioners of the District of Columbia the following classification of market milk was adopted: (1) The term "certified milk" should be limited to milk produced at dairies subjected to periodic inspection and whose products are subjected to frequent analysis (2) "inspected milk" should be limited to clean raw milk from healthy cows as determined by the tuberculin test and physical examination by a qualified veterinarian, (3) "pasteurized milk" should be applied to milk from dairies not able to comply with the requirements specified for classes 1 and 2 and should be pasteurized before being sold. Pasteurizing should not be the goal for which the dairyman should aim. It is better to keep the germs out than to kill them after they have contaminated the milk. Moreover, pasteurized milk if kept for some time may contain poisons formed by bacteria not killed by heating. The danger is often unsuspected, for such milk may not be sour. Evans and Cope, of the University of Pennsylvania, showed that poison-forming species are often destroyed even when milk is not heated; that raw milk is to some extent a germicide; and that pasteurizing should be looked upon as an evil necessity.

Many experiments have been made at the State stations with reference to the manufacture of butter and cheese. At the Wisconsin Experiment Station cheese made from pasteurized milk was of a more uniform flavor than when made from raw milk. Prof. Jensen, of Denmark, as a result of his investigations, expressed his opinion that the feed can influence the quality of the cheese, but that this influence is an indirect bacteriological one rather than chemical. The influence of feed on the quality of the product is probably of greater importance in cheese-making than in the manufacture of butter. Under the Pure Foods and Drugs Act all cheese made from curd that has been soaked in water must be labelled "soaked curd cheese." The Department of Agriculture demonstrated that butter made from pasteurized cream without any fermentation has superior keeping qualities; that by paraffining butter tubs there is less loss in weight than when tubs are untreated. Among the important works during the year are: *The Business of Dairying*, by C. B. Lane (New York); *Milk and Its Relation to the Public Health*, Bulletin No. 41. Hygienic Laboratory, Washington, D. C.

DALAI LAMA. See CHINA, *History*.

DAMS. (THE LAGUNA DAM on the Colorado) River, part of the Yuma irrigation project of the United States Reclamation Service, of which undertaking about 62 per cent. was completed in 1908, was being built for the purpose of furnishing water to the valley lands adjacent to the Colorado and Gila Rivers near Yuma, Arizona. The dam is located at Laguna, about 12 miles above Yuma, where the valley is a little less than a mile wide and where the discharge varies throughout the year between 4,000 and 100,000 cubic feet per second. No bed rock has been found here, so that the sand and silt must be used as a foundation upon which to build the structure. The dam proper consists of 3 concrete walls, 4,800 feet long, spaced 57 and 93 feet apart, and which extend from one bluff to the other on opposite sides of the river. The crest wall, which rests upon six inch sheet piling, 12 to 20 feet long, will be 19 feet above the bed of the stream, and thus raise the water level 10 feet, besides backing it up for a distance of ten miles, and forming a settling basin of 8 square miles area. The lower or apron wall is to be below ordinary low water, while the space between walls is to be filled in with stone, and covered with an 18 inch capping of concrete, the stone also being placed for a distance of 40 feet down stream. A pile trestle was to be carried across the openings between the completed ends when nearly finished, and from this rock will be dumped at low water to close up the gap, while the river will be diverted from the main channel through the by-pass sluice-ways that have been driven through rock at each end of the dam. Behind a protection thus built the gap will be closed in the main dam before a flood arrives. Such preparations for the closing of the river were completed Dec. 9, 1908, and the dumping of rock was begun. At noon, on Dec. 21, 1908, the river was entirely diverted, and the closure subsequently successfully withstood a flood in the river of 40,000 cubic feet per second.

PATHFINDER DAM. The Pathfinder Dam, which is part of the North Platte project of the United States Reclamation Service and of which 97.5 per cent. was completed in 1908, was one of the largest being built by the government. It is

located in Wyoming on the North Platte about 3 miles below its junction with the Sweetwater River, and 45 miles southwest of Caspa. At the site the canyon is 190 feet deep, only 80 feet wide at the bottom, and 180 feet at the top. The dam is built of cyclopean rubble masonry, is 218 feet high to the top of the parapet, 10 feet thick at the top, 94 feet at the base, was to be completed in 1909, and was designed to impound 326,000,000,000 gallons.

ROOSEVELT DAM. The Roosevelt Dam near Phoenix, Arizona, part of the Salt River project of the United States Reclamation Service, of which 75 per cent. was completed at the end of 1908, was one of the greatest structures of the kind in the world. It is 1,080 feet long, 284 feet high, with a maximum water depth of 242 feet, and provides storage for 1,284,000 acre feet. During the one month of Dec., 1908, 12,500 cubic yards of masonry were placed, bringing the acreage elevation up to 85 feet.

BELLE FOURCHE DAM. The Belle Fourche Dam on Owl Creek, South Dakota, a very large earth structure which was being built by the United States Reclamation Service, in connection with the irrigation project of the same name, and of which about 65 per cent. was completed in 1908. It was to be 6,500 feet long, with a maximum height of 115 feet. The earth body is adobe clay, which is deposited wet in 6 inch layers, and rolled. The total volume is 1,600,000 cubic yards and it was being handled by steam shovels, dump cars, dump wagons, and elevating graders.

PROPOSED SACANDOGA DAM. A dam and reservoir was proposed by the State of New York, for the Sacandoga River, near Conklinville, Saratoga County, which, if built, would flood some 40 square miles or an area nearly equal to that of Lake George, store 26,000,000,000 cubic feet of water, produce 50,000 H.P., and increase considerably the dry weather horsepower on the Hudson River below. The dam, constructed by hydraulic means, would be founded on fine sand, with a concrete core wall and sheet piling. By it the water would be backed up as far as Northville, flood a number of small southern Adirondack settlements, and about 4 miles of the Fonda, Johnstown & Gloversville Railroad.

The State of New York proposed to build a dam on the Genesee River at Portageville, just above Letchworth Park, to store 18,000,000,000 cubic feet of water, provide 32,000 H.P. and add 14,000 H.P. to that already developed at Rochester. In addition, it would prevent flood damage on the Genesee flats, and to property in Rochester, besides affording dry weather sewage dilution which would relieve the City of the expense of constructing a trunk sewer. The structure would be of concrete 160 feet high, 1,200 feet long on the crest, be curved in plan, and form a lake 15 square miles.

FAILURE OF THE HAUSER LAKE DAM. The Hauser Lake Dam on the Missouri River 18 miles below Helena, Mont., built of steel, failed on April 14, 1908 due to floods. Little damage was done other than that to the structure as the river passes through canyons for 28 miles below the site. It was estimated that the dam would take 6 months to rebuild and cost \$250,000. Borings for the rebuilding were begun later in the year. The failure was caused by the undermining of the foundation and the giving way of a section of the steel work, which gap in-

creased in size till it had reached a length of 500 feet. The proposed new dam was to be of concrete.

DAMS. It was stated that the great dam at Austin, Texas, which failed in 1900, might be rebuilt, and with that end in view diamond drills were put to work so that a correct idea of the material beneath the dam site might be obtained. The Cataract dam at Sydney, New South Wales, which was erected to increase the stored water supply, is constructed of cyclopean rubble principally, the blocks, weighing from 2 to 4½ tons, being set in mortar, and packed round with concrete. The following are the principal dimensions: Length, 811 ft.; height above river bed, 157 ft.; top width, 16½ ft.; bottom width, 158 ft.; maximum depth of stored water, 150 ft.; storage capacity, nearly 26,000,000 gals.; and cost, \$1,600,000.

DANBURY HATTERS' CASE. See **BOYCOTT.**

DANIELS, GEORGE HENRY. One of the most widely known railroad men in the United States, and an ex-general passenger agent of the New York Central Railroad, died at Lake Placid, N. Y., on July 1, 1908. He was born at Hampshire, Ill., on Dec. 1, 1842, and from the age of fifteen until his retirement from active service in May, 1907, devoted his entire business life to railroading. He was, in turn, in the engineering corps of the North Missouri Railroad, general freight and passenger agent of the Chicago and Pacific Railroad, general ticket agent of the Wabash, St. Louis and Pacific Railroad, commissioner of the Iowa Trunk Line Association, commissioner of the Colorado Traffic Association and Passenger Committee, later merged into the Central Traffic Association, which he served as vice-chairman, and chairman of the Chicago Eastbound Passenger Committee. In 1899 he was appointed general passenger agent of the New York Central Railroad, where his administration was marked by greatly improved traffic facilities and the introduction of many effective reforms and innovations in the way of advertising.

DANISH WEST INDIES. See **DENMARK.**
Danish Colonies.

DARTMOUTH COLLEGE. An institution of higher learning at Hanover, N. H., founded in 1769. The attendance in 1907-8 was 1,217. In the autumn of 1908 it showed a still further increase, 1,233. During the year 1907-8 the new medical laboratories were completed and added to the college plant. Another large dormitory, accommodating more than 100 men, was completed and put to use. The dormitories of the college now accommodate more than 1,000 men. Rollins Chapel was extensively remodelled, with a marked increase in size, and now has a capacity of about 1200. The endowment of the college is between two and three million dollars. The library contains something more than 100,000 volumes. The president, William J. Tucker, who had tendered his resignation in 1907, retained his position in 1908.

DARWIN MEMORIAL. In commemoration of the fiftieth anniversary of the publication of the joint paper on the "Tendency of Varieties to Depart Indefinitely from the Original Type" by Darwin and Wallace, before the Linnean Society

of London, the Society held, on July 1st, 1908, a special meeting at which a specially prepared gold medal was given to Wallace, and copies of this medal in silver were awarded to Sir Joseph Hooker, Prof. Ernst Haeckel, Edouard Strasburger, Aug. Weismann, Francis Galton, and Sir E. Ray Lankester. Addresses were made by Wallace, Lankester, and others. In referring to recent controversies over the doctrine of natural selection, Lankester said, "Not only do the main lines of the theory of Darwin and Wallace remain unchanged, but the more it is challenged by new suggestions and new hypotheses, the more brilliantly does the novelty, the importance, and the permanent value of the work of these great men—show forth as the one great and epoch making effort of human thought on the subject." Similar commemorative exercises to celebrate the 100th anniversary of Darwin's birth and the 50th of the publication of the *Origin of Species*, were planned for 1909.

DAVIS, CHARLES ABBOTT. An American naturalist, died on Jan. 29, 1908. He was born on Mar. 24, 1868, in Burlington, Vt., and graduated at the Polytechnic Institute, Worcester, Mass. After teaching in Wilmington, Del., Atlanta, Ga., in the Connecticut State Agricultural College, at Storrs, and for nine years in the Technical High School in Providence, he became, in 1904, curator in the Roger Williams Park Museum, at Providence, R. I., a position he occupied at the time of his death. He was a member of several of the scientific societies, and was a naturalist of recognized authority.

DEATH RATE. See **VITAL STATISTICS.**

DEBS, EUGENE VICTOR. An American labor leader, presidential candidate of the Social Democratic party in 1900 and of the Socialist party in 1904 and 1908. He was born at Terre Haute, Ind., on Nov. 5, 1855, was educated in the common schools, and at the age of sixteen became a locomotive fireman on the Terre Haute and Indianapolis Railroad. From 1875 to 1879 he was in the wholesale grocery business, and in the latter year was elected city clerk, which position he filled until 1883. In 1885 he was elected member of the Indiana State legislature. He was grand secretary and treasurer of the Brotherhood of Locomotive Firemen from 1880 to 1893; president of the American Railway Union from 1893 to 1897; and chairman of the national council of the Social Democracy from 1897 to 1898. In 1900, as candidate of the Social Democratic party for president, he polled a popular vote of 87,814. While serving as president of the American Railway Union, he successfully managed the strike on the Great Northern Railroad. In 1894 he managed a general strike on the western railroads, and was charged with conspiracy, but was acquitted. He was then charged with violating an injunction and committed to jail for six months in contempt of court. In 1904 and again in 1908 he was the candidate for president of the Socialist party, receiving in the former year a popular vote of 402,283 and in the latter year of about 482,000. Mr. Debs has contributed extensively to the popular literature of socialism and has been an earnest agitator in behalf of the cause, arousing much enthusiasm on the part of his followers, and the respect of many not at all in sympathy with the movement.

PATHFINDER DAM, LOOKING UPSTREAM, NORTH PLATTE PROJECT, NEBRASKA AND WYOMING

THE ROOSEVELT DAM OF THE SALT RIVER IRRIGATION PROJECT, ARIZONA

DAMS

U.S. D.A.

1911

DEBUSSY, ACHILLE CLAUDE. A French composer. He was born in St. Germain-en-Laye, on August 22, 1862. He studied music at the Paris Conservatory, where he won the Prix de Rome for composition in 1884. His music-drama *Pelléas et Mélisande*, founded on Maeterlinck's play of the same name, was first produced in Paris in 1902. In March, 1908, it was produced at the Manhattan Opera House, New York City, with Mary Garden (q. v.) as *Mélisande*. She had created the part in the Paris production. Debussy's shorter works include several suites and other compositions for piano and for orchestra, and numerous songs. Although his earlier compositions are quite orthodox, he has in recent years followed a harmonic system—or rather lack of it—of his own. The universally accepted theory of harmony among civilized nations is based on the chromatic or half-tone scale. Debussy bases his harmonies on a whole-tone scale. His system has been criticised on the ground that it abjures melody, and defies every existing tradition concerning key relationship, chord-formation, and harmonic progression. On the other hand his work has many enthusiastic admirers among cultivated lovers of music.

DELAWARE. One of the States of the North Atlantic Division of the United States and one of the thirteen original States. The area of its land surface is 1,965 square miles and its water surface, 405 square miles, or a total of 2,370 square miles. In 1900 the population of the State was 184,700, and according to a Federal estimate of 1908 it was in that year 197,728. The capital is Dover. The population of Wilmington, the largest city, was estimated in 1908 at 85,000.

MINERAL PRODUCTION. The mineral products of Delaware are relatively unimportant. The output of clay products holds the highest place in mineral production. This amounted in 1907 to the value of \$190,440, a decrease of \$47,328 in the value of the product of 1906. Stone was produced in the State in 1907 to the value of \$58,192. This was entirely granite. Mineral water was produced in the State in 1907 for the first time, one spring near Wilmington reporting a large output. Among other products are coal tar, illuminating gas, gas coke, sand and gravel, and sand lime brick. According to the figures given by the United States Geological Survey, from whose reports the statistics given above are taken, the total value of the mineral production in the State in 1907 was \$431,438 as compared with a value in 1906 of \$814,126.

AGRICULTURE AND STOCK RAISING. The area of the State given up to agricultural products is comparatively small, but the acreage of the principal crops is notably large. The acreage, production, and value of the principal crops in 1908, according to the United States Department of Agriculture, were as follows: Corn, 6,240,000 bushels, valued at \$3,682,000 from 195,000 acres; winter wheat, 1,725,000 bushels, valued at \$1,725,000 from 115,000 acres; oats, 119,000 bushels, valued at \$64,000 from 4,000 acres; rye, 16,000 bushels, valued at \$13,000 from 1,000 acres; buckwheat, 30,000 bushels, valued at \$22,000 from 1,000 acres; potatoes, 656,000 bushels, valued at \$544,000 from 8,000 acres; hay, 125,000 tons valued at \$1,562,000 from 544,000 acres. Owing to its proximity to large cities and to its climate, the State is well

suited to market gardening. Delaware produces annually about 20,000,000 quarts of berries, and apple growing has become the most profitable branch of fruit growing in the State. The canning industry is an important feature in the agriculture of the State. The number of farm animals has remained constant in recent years. The estimated value of the wool clip in 1908 was \$10,395.

MANUFACTURES. A comparison of the industries carried on in factories in 1900 and 1905 showed that in 1905 there were reported 631 such establishments, with \$50,925,630 capital, employing an average of 18,475 wage-earners, and having products valued at \$41,169,276. Of these four items the first and last were slightly less than the corresponding numbers for 1900; the number of wage-earners was 10.0 per cent. less, and the amount of capital invested was 31.3 per cent. greater. Of the wage-earners in 1905, 2,960 were women at least 16 years of age, and 649 were children under 16. The value of output of the leading industries was as follows: Leather, tanned, curried, and finished, \$10,250,842; railway shop work, \$3,599,736; foundry and machine shop products, \$3,432,118; paper and wood pulp, \$1,904,556. These industries showed little change during the five years 1900-1905. Iron and steel products, however, fell in value from \$3,159,641 in 1900 to \$1,597,309 in 1905. Other industries in 1905 were iron and steel ship-building, flour and grist mill products, and canning and preserving fruits and vegetables. The city of Wilmington was credited with \$30,390,039 of the value of products in 1905. This city embraced all of the two leading industries and almost all of the others mentioned above.

FINANCE. The report of the State Treasurer for the fiscal year 1907 showed a balance in the treasury on Jan. 9, 1907 of \$87,696. The receipts for the fiscal year ending Jan. 14, 1908, were \$1,017,336 and the disbursements, \$986,876, leaving a balance on Jan. 14, 1908 of \$118,157. The receipts were made up of the following funds: The general fund, \$576,219; school fund, \$179,504; sinking fund, \$261,612. The chief receipts from the general fund were from the State tax from licenses and fees, and from sales of bonds. The chief disbursements were for public schools, the Delaware State Hospital, general appropriations, and for colleges of agricultural and mechanical arts. The public debt on Jan. 14, 1908, amounted to \$816,785.

FISHERIES. The fishing industry in 1908 made a much better showing than in 1906-7, when it was largely a failure from a financial standpoint owing to the scarcity of shad. In 1908 there was a much better run of shad and high prices prevailed throughout the season. The value of those taken for the year 1908 approximates \$100,000. The value of the oysters taken was 20 per cent. higher than in 1906-7. The value of the production of the menhaden industry for 1908 was \$285,000 as against \$160,000 in 1907. From 300 to 400 men are employed in this industry.

POLITICS AND GOVERNMENT. There was no meeting of the State legislature in Delaware in 1908. The local option election held in Nov., 1907, resulted in Kent and Sussex counties voting for prohibition, which took effect immediately upon the official announcement of the result. On Jan. 4th, suit was begun by the liquor interests in Wilmington to test the law under

which the special election was held, and the law was sustained by the court.

CONVENTIONS AND ELECTIONS. The Republican State Convention met at Dover on April 7. Opposition developed to an attempt to endorse William H. Taft for President and the Convention finally decided to give no instructions. The Democratic State Convention met at Dover April 14th. The delegates elected were instructed to present the name of Judge George Gray at the National Democratic Convention at Denver, and in spite of the emphatic objections of Judge Gray, these instructions were given. The Convention adopted resolutions condemning the Republican party for the usurpation of power. In the election of Nov. 3, the vote for the National ticket was as follows: Taft, 25,014; Bryan, 22,071; Chafin, 670. S. H. Pennewill, Republican, was elected governor by about 2,000.

STATE OFFICERS. Governor, Simeon H. Pennewill; Lieutenant-Governor, John M. Mendinhall; Secretary of State, D. O. Hastings; Treasurer, David O. Morse; Auditor, Theo. F. Clark; Attorney-General, Andrew C. Gray; Adjutant-General, I. P. Wickersham; Commissioner of Insurance, Chas. H. Maull—all Republicans, except Gray, Democrat.

JUDICIARY. Supreme Court: Chancellor, John R. Nicholson, Dem.; Chief Justice, Chas. B. Lore, Dem.; Associate Justices, Ignatius C. Grubb, Dem.; W. C. Spruance, Rep.; James Pennewill, Rep.; William H. Boyce, Dem.; Clerk, Walter Pardoe, Rep.

The legislature of 1909 is composed of 11 Republicans and 6 Democrats in the Senate, and 17 Republicans and 18 Democrats in the House. The Congressional representation will be found in the article UNITED STATES, section *Congress*.

DELCASSÉ, THÉOPHILE. See FRANCE, *History*.

DENMARK. The smallest of the Scandinavian kingdoms. Area, exclusive of dependencies, 15,385 square miles; population (1906), 2,605,268 (1,265,788 males and 1,339,480 females), of whom 426,540 lived in Copenhagen, 1,037,685 on the islands, 1,124,694 in Jutland, and 16,349 on the Faroe Islands. In 1907 there were 20,103 marriages, 76,151 births, 39,089 deaths, and 7,890 emigrants. The principal cities, with their populations in 1906, are: Copenhagen, the capital, 426,540 (with suburbs, 514,134); Aarhus, 55,193; Odense, 40,547; Aalborg, 31,509; Horsens, 22,237; Randers, 20,963.

EDUCATION. In 1906 there were 2,940 elementary schools with 341,356 pupils. Secondary schools have over 55,000 pupils. There are also people's high schools, technical, commercial, and agricultural schools, a veterinary and agricultural college, a college of pharmacy, a Royal academy of arts, a polytechnic, etc. The University of Copenhagen has about 2,000 students.

PRODUCTION. The soil is subdivided into numerous small farms. About 35 per cent. of it is arable, 35 per cent. pasture and meadows, 6 per cent. forest, 3 per cent. peat bogs, and the remainder unproductive. In 1906, the chief crops were as follows, in hectolitres (1 hectolitre = 2.838 U. S. bushels): Wheat, 1,465,923; barley, 7,768,714; oats, 14,156,709; rye, 6,632,009; mixed grain, 4,651,205; potatoes, 10,025,393; beets and other root crops, 96,883,060. The sugar-beet production in 1907-8 was 380,000 metric tons; in 1908-9, 460,000 tons. The production of oats in 1907 was 40,000,000 bushels; of wheat, 4,000,000 bushels. The home production of wheat

and rye is insufficient; in 1907 there were consumed 341,500 sacks of imported flour of 220½ pounds each. In 1903, there were 486,935 horses, 1,840,466 cattle, 876,830 sheep, and 1,456,699 pigs. Dairy products are exported on a large scale, chiefly to England. In 1907, the export of butter amounted to 220,550,000 pounds, of which 188,980,000 pounds were of Danish origin, and the remainder, about 14 per cent. of the total, was almost entirely Siberian butter re-exported. Eggs were exported in 1907 to the amount of 35,000,000 dozen, nine-tenths of the amount being domestic produce. Laborers from Russian Poland and Galicia come every year to work on the farms; in the spring of 1907 there were 6,647 Polish season laborers, 5,000 of them on the islands and 1,648 in Jutland. There are in the country 30 flour mills ranging from 300 to 1,000 barrels daily capacity, besides numerous smaller ones. The number of tanneries and their output has decreased in recent years. In 1907 there were some 70 tanneries, employing 520 men. The production of beet-sugar, carried on by two companies in seven factories, amounted to 50,000 tons in 1907-8 and 64,000 tons in 1908-9. In the year ending Aug. 31, 1908, there were 77,644 cotton spinning spindles, the mill consumption of cotton during the year being 11,255 bales. The yield of fisheries in 1905 was valued at 11,422,273 kroner.

FOREIGN COMMERCE. The imports and exports (special trade) in 1907 amounted to 681,129,000 and 416,863,000 kroner respectively, against 559,328,000 and 393,512,000 in 1906 (1 kroner = 26.8 cents). The general trade in 1907 comprised 788,868,000 kroner of imports and 604,922,000 of exports, against 725,626,000 and 559,508,000 in 1906. In the special trade of 1907 the principal imports were: Cereals, 54,582,000 kroner; cotton seed and oil cakes, 52,189,000; coal, 46,795,000; iron and steel manufactures, 35,124,000; timber and lumber, 29,428,000; woolen tissues, 21,374,000; cotton and other vegetable tissues, 20,090,000; boats, 13,938,000; hides and skins, 10,015,000; iron, 9,704,000. The principal exports in the special trade of 1907 were: Butter, 469,075,000 kroner; meats, 107,227,000; live animals, 36,781,000; eggs, 26,540,000; hides and skins, 11,671,000; boats, 9,624,000; fish, 7,847,000; iron manufactures, 5,706,000; barley, 5,230,000. The general trade with the principal countries of origin and destination in 1907 was as follows, in kroner:

From and to	Imports	Exports
Great Britain	135,008,000	311,774,000
Germany	257,837,000	129,392,000
Sweden	67,173,000	53,071,000
Norway	13,655,000	18,500,000
Russia	76,469,000	35,390,000
Netherlands	22,918,000	1,010,000
Belgium	9,925,000	1,841,000
France	17,278,000	1,160,000
United States	124,128,000	27,398,000

On Jan. 1, 1909, the new tariff was to come into force. It was a compromise between the out and out free traders and the protectionists.

COMMUNICATIONS. The tonnage entered and cleared in the foreign trade in 1907 was 3,864,426 and 1,256,195 respectively; in the coasting trade, 1,621,908 and 1,604,323. The

merchant marine on Jan. 1, 1908, consisted of 3266 sailing vessels, of 121,217 tons, and 641 steamers, of 402,003 tons. The railways in operation at the end of 1906 had a length of 2,082 miles, of which 1,167 miles belonged to the State. The State telegraph lines aggregated 2,318 miles.

FINANCE. The revenue and expenditure in 1906-7, ending Mar. 31, were 127,018,791 and 113,833,493 kroner respectively; in 1907-8, 94,499,771 and 94,119,618. The budget for 1908-9 estimated the revenue at 94,054,240 kroner, and the expenditures at 101,322,269. The principal estimates of revenue for 1907-8 were: Interest and profit on State assets, 6,406,486; direct taxes, 15,161,000; indirect taxes, 64,306,100. The expenditures were: Civil list, 1,155,200; public debt, 8,340,658; worship and public instruction, 11,834,693; interior, 11,013,044; war, 13,252,329; marine, 8,290,902; capital expenditure on public works, railways, etc., 16,213,269. The public debt stood on Mar. 31, 1908, at 255,933,203 kroner. The State assets on the same date consisted of: Surplus in treasury, 50,161,018 kroner; emergency reserve fund, 17,896,740; State railways, 221,506,211; royal castles and estates, 244,600,000; forests, 28,000,000; various, 100,175,964; total, 662,339,933.

ARMY AND NAVY. The army is a sort of national militia, in which all citizens between the ages of eighteen and thirty-nine years are obliged to serve, except the inhabitants of Iceland, the Faroe Islands, and the Danish Antilles. Very few exemptions are allowed in Denmark, even the clergy having to serve five years. The initial period with the colors is six and one-half months in the infantry, twelve months in the field artillery, and nineteen months in the cavalry, with two subsequent periods of twenty-five days each. The recruits are usually called up at the age of twenty-two and spend eight years in the army and eight in the territorial reserve. The peace strength of the army is about 14,000 men of all ranks. The infantry is equipped with the Krag-Jorgensen rifle, the cavalry with the Remington carbine, and the field artillery with a Krupp shielded gun. A new machine gun known as the Rekyl (Madsen type) was adopted in 1908. It weighs only about 17½ pounds, is carried and used by one man, comes into action quickly and without attracting attention, and fires at the rate of 300 rounds per minute. The effective navy consisted at the beginning of 1908 of 4 coast defense vessels, 12,500 tons; 4 protected small cruisers, 6,900 tons; 13 torpedo boats, 1,422 tons; total, 21 ships, of 20,822 tons, with 267 officers and 1,137 men. In 1907 there was a decrease of 14,190 in effective tonnage.

GOVERNMENT. The King is Frederick VIII., born June 3, 1843; succeeded his father, Jan. 29, 1906. The premier of the cabinet formed Oct. 12, 1908, is N. T. Neergaard.

DANISH COLONIES. The colonial possessions of Denmark consist of the island of Iceland, with an area of 40,456 square miles, of which 16,242 are inhabited, and a population of 78,470 in 1901; the island of Greenland, with an approximate area of 835,848 square miles, of which 34,000 are free from ice, and a population in 1901 of 11,895 (309 Europeans); and the Danish Antilles, consisting of St. Croix, 84 square miles and 18,590 inhabitants in 1901; St. Thomas, 33 square miles and 11,012 inhabitants; and St. John, 21 square miles and 925

inhabitants. The inhabitants of the Danish Antilles are mostly free negroes engaged in the cultivation of sugar cane. The trade of Greenland is a State monopoly, and its exports, like those of Iceland, consist largely of fish and fish products. In 1907 the trade of Denmark, with its colonies, was as follows: Imports from Iceland, 6,096,000 kroner; and exports to it, 5,140,000; imports from Greenland, 1,119,000, and exports to it, 492,000; imports from Danish Antilles, 24,000, and exports to them, 30,000. Iceland has a local legislature, the Althing, consisting of 34 elected members and 6 appointed by the King. A minister for Iceland, appointed by the King, resides at Reykjavik, the capital of the island.

HISTORY.

RELATIONS WITH ICELAND. During the King's visit to Iceland in 1907 a commission was appointed, consisting of members of the Danish Rigsdag and the Icelandic Althing, to determine the future relations of Denmark and Iceland. It presented a report on May 14, in the form of a draft of a new law which required the approval of the respective parliaments of the two countries. It declared Iceland a self-governing, free and independent country, forming with Denmark the United Danish Empire, having in common the kingship, the Ministry of Defense, and the Ministry of Foreign Affairs. At home the Icelanders will fly their own flag, but the war and commercial flags are to be in common. Equal rights are to be enjoyed in both countries. The Icelandic treasury will contribute toward the government's civil list. Concessions were made to Iceland in regard to the inspection and nationalization of the fisheries, and a separate Supreme Court was established in the island. The Danish treasury was to pay to Iceland the sum of 1,500,000 kroner. The members of the commission differed as to the right of either party to denounce the common arrangements, the Danish member holding that this right should extend to everything except the common kingship. The Icelandic elections gave the victory to the opposition, who wished the only tie between the two countries to be the common kingship. The Danish parliament dissolved without taking any action on the project.

NEW ELECTORAL LAW. A compromise was reached on Jan. 10, 1908, between the Left Reformists and the Liberal Conservatives in the Rigsdag, on the question of electoral reform. This paved the way for the passage on April 20 of a new measure providing for the extension of suffrage to women in municipal elections. The chief points in the new law were as follows: The right to vote in municipal and communal elections, and for the election of commissions of tax assessment and distribution is bestowed on all persons of either sex, 25 years of age or over, who have not suffered punishment for infamous crime, who have lived two years in the same district, paid taxes, and not received poor relief (or if they have received it have paid it back); *the scrutin de liste* and proportional representation; women to have the right to vote for the general councils as soon as they become property owners in the department. It was estimated that the effect of the new law would double the number of the electors, bringing it up to 900,000, including 300,000 married women, 50,000 independent unmarried women, and 30,000 domestics.

OTHER NEW LAWS. The compromise on Jan. 10 put an end to the differences between the government party and the Conservative groups, which, although the government had a majority in the Folkething, had prevented its getting its measures through hitherto. The more liberal portion of the Conservative group aided the government in its reform programme, and it succeeded in passing not only the important electoral law above mentioned, but the law on customs duties (May 5) and that on judiciary reform (May 16). The new customs law increases relatively the duties on articles of luxury, including tobacco and wine, and lowers those on articles of prime necessity, such as coal and petroleum. It was the result of the compromise between free traders and protectionists. It gives a certain measure of protection to the trades and industries. The Socialists finally supported the law, though at first their counsels were divided, for they wished on the one hand to avail themselves of the protection which the law afforded to manual labor, and on the other to win over to their party the agricultural laborers. The law did not make any radical change in policy but it diminished the public revenue, which was made up by increasing the duty on alcohols and the succession duties. The latter now have a progressive character, the principle of a progressive tax being for the first time introduced in Denmark. The law reforming the judiciary, which does not become operative for some years, provides for the publicity of judicial proceedings and the predominance of oral procedure and introduces a jury system in criminal and political trials. These changes had been promised by the constitution of 1849 but were always deferred. The constitution also promised the separation of judicial and administrative powers, but this was never fully carried out on account of the expense, and except in the principal cities, the judges in the first instance will continue to perform certain police functions. Among the other measures was that on illegitimate children, requiring the father to pay three-fifths of the child's support, and in case of the mother's death, to pay for its entire support until the child reaches the age of eighteen, or in certain cases, seventeen years.

FOREIGN AFFAIRS AND THE DEFENSE QUESTION. International friendship was promoted by royal visits during the year. The Swedish King, the King and Queen of England, and the President of the French Republic visited Copenhagen. In its foreign policy, Denmark plays merely a passive rôle. By special friendliness to Germany, she has hoped to gain a more lenient treatment of the Danish inhabitants of Schleswig under Prussian rule, but in this has met with slight success. The policy of Germany toward the Danes of Schleswig has been criticised in Denmark as dictated solely by a desire to maintain the leadership of the German Empire. Denmark was a party to the convention signed at St. Petersburg on Apr. 23, which provided for the preservation of the status quo in the Baltic. (See GERMANY, paragraphs on *History*.) On the same day it subscribed to the parallel agreement signed at Berlin, which dealt with the maintenance of the status quo in the North Sea. The question of defense had been before the country for several years. A special Parliamentary Commission, after having the matter under consideration for six years, showed itself divided in opinion, one side favoring the forti-

fication of Copenhagen, and the other opposing it. Between these extremes, the Reformist party offered as a solution of the problem the destruction of the fortifications of Copenhagen on the landward side, except some permanent works, and the extension of the coast fortifications and the development of the navy. A novel entitled *The Day of Judgment* caused much comment on the question of national defense by its picture of an imaginary German invasion resulting in the capture of the King and the destruction of Danish independence. On July 25, the Crown Prince expressed himself strongly for fortification both by sea and land and his views were widely applauded, but the King's references to the subject were of a guarded nature.

THE MINISTRY AND THE ALBERTI AFFAIR. In the spring the Cabinet lost a valuable member in M. Lassen, Minister of Finance. For a time, the Premier, M. Christensen, held the portfolio of Finance, and it was then that he put through the customs law with some reduction of the wine duty in order to satisfy the claims of France. M. Alberti (q. v.), the Minister of Justice, had been severely criticised for certain financial dealings as well as for his high-handed administration of his office. He was useful to the Ministry through his active efforts in putting through the measure for the reform of the judiciary and this improved his position, but at length the Premier, finding it no longer advantageous to retain him, caused his retirement. He was succeeded by M. Høgsbrø, the Minister of Ways and Communications, who in turn was succeeded in that office by M. Jensen-Sønderus. M. Ole Hansen resigned from the Ministry of Agriculture and was succeeded by M. Anders Nielson, the leader of the Reformists. On Sept. 8, M. Alberti gave himself up to the authorities admitting malversation and fraud. It was found that he had embezzled a sum estimated at \$4,000,000 and affecting two concerns which had been managed by him, the Zealand Peasants' Savings Bank and the Butter Exportation Company. A hue and cry was started by the newspapers and the affair was called the "Danish Panama." M. Alberti had distinguished himself by his intelligence, energy, and ambition, but his methods had inspired the distrust of many, and he had already been the subject of much criticism. He was the son of a well known member of the Left, who organized the Zealand Peasants Savings Bank. He became a Director of the Bank and in 1889 entered the Butter Exportation Company. About the same time he was elected to the Folkething. Though not liked, he had to be reckoned with as a man of force, and he was appointed to the Ministry of Justice in 1901, and later held the same portfolio in the Christensen Ministry. His financial enterprises were unsuccessful, and he speculated and undertook various doubtful enterprises, running heavily into debt. As Minister he was accused of abusing his power, of favoritism and of arbitrary conduct, and during the past year had been attacked violently both in the press and in the Rigsdag. In order to cover the deficit of the Savings Bank, he deposited a false receipt from the Copenhagen Bank for several millions. M. Christensen, personally honest, and of unsullied reputation, thought at first that he need not resign, but he was held responsible in public estimation in that he had paid no attention to the criticism of Alberti, but on the contrary had procured a favor for him from the King on the occasion of his

resignation from the Ministry. He had, moreover, loaned on security as Minister of Finance, a considerable sum to the Savings Bank. Though he was still trusted by the Reform Left, the strongest party in the Rigsdag, it appeared from the debate after the reassembling of Parliament on Sept. 28, that the retirement of the Ministry was necessary. M. Neergaard, Minister of Finance, a distinguished economist and leader of the Moderate Left, was charged with the formation of a new Ministry. On Oct. 11 he presented his list. Four members of the old Cabinet remained and the new members were as follows: Count Ahlefeldt-Laurvig, Minister of Foreign Affairs; M. Braun, Minister of Finance; M. Bernstein, Minister of the Interior. M. Neergaard himself assumed the Ministry of National Defense. The succeeding Ministry, like the former one, was Agrarian in spirit. M. Christensen became the leader of the Reform party. The programme announced by the Ministry included a statement that Denmark must be placed in a situation to defend her neutrality and command the same degree of military strength as other nations of her class, and that the government would soon propose measures to that end, based on the report of the Commission of Defense.

DEPOSIT GUARANTEE. See BANKS AND BANKING.

DERBY, FREDERICK ARTHUR STANLEY, Earl of. See STANLEY, FREDERICK ARTHUR.

DEVONSHIRE, SPENCER COMPTON CAVENDISH, Eighth Duke of. An English statesman, died at Cannes, France, on Mar. 24, 1908. He was born in London, on July 23, 1833, graduated at Trinity College, Cambridge, in 1854, and was returned to Parliament for the Northern Division of Lancashire, in 1857. A year later, upon the succession of his father to the dukedom, he became Marquis of Hartington, by which title he was known until in 1891 the death of his father made him the Eighth Duke of Devonshire. In the spring of 1863 he became Lord of the Admiralty, and a few months afterward he was transferred to the office of Under Secretary of War. In 1866-68 he was Secretary of State for War. At this time he was supporting firmly, if not enthusiastically, Mr. Gladstone's Irish Church disestablishment policy, and he was defeated in the Northwestern division on that issue in 1868. But he was returned in the following year from the New Radnor district, which he continued to represent until 1880. He became Postmaster-General in Mr. Gladstone's Cabinet in 1869, and in 1871 he was made Irish secretary. In 1869 he presided over the parliamentary inquiry into the election frauds of 1868, and in 1870 he introduced an election reform bill which, however, did not become a law until two years later.

As Irish Secretary, Lord Hartington showed much firmness in dealing with the Fenian faction. As temporary leader of the opposition in the Commons during Mr. Gladstone's absences in 1874, he declared himself to be unreservedly in favor of an imperial policy in dealing with the Home Rule question. Just before the meeting of Parliament in 1875 he was formally chosen leader of the Liberal opposition, a post which he held for the next five years; and in this capacity he warned the Irish members that "exceptional legislation" would be continued as "long as organized crime and coercive intimidation" existed. In 1880 he was returned from

Northeastern Lancashire (which he continued to represent until 1885), and in the same year Queen Victoria offered him the premiership, but he declined the office in favor of Mr. Gladstone and entered the cabinet as Secretary of State for India. This portfolio he held until 1882, when he became Secretary of War, a post he held until 1895. From 1885 until 1891 he represented the Rossendale Division of Lancashire. He denounced the annexation of the Transvaal and defended the evacuation of the Sudan, and as Secretary of War addressed to the House an elaborate explanation and apology for the delays which caused the Khartoum expedition to be too late to rescue Gordon. He refused, however, to countenance the scheme by which the Home Rule bill was to be "hung up," and it was on his motion, and largely through his influence, that the bill was defeated on its second reading. In the campaign he assailed the "separatist" policy, and denounced what he considered evasion and concealment on Mr. Gladstone's part, and upon the defeat of the Liberals, Salisbury suggested Hartington for the premiership. Hartington, however, refused this offer, and even declined a portfolio in Salisbury's cabinet, because of his unwillingness formally to ally himself with the Conservatives. But in the Parliament of 1886-92 he steadily supported the government, working meanwhile to bring about the electoral solidarity of the two factions of the Unionists, the effect of which at the next elections was the reduction of the Gladstonian majority to only forty, a margin much too small for working purposes.

Upon the death of his father, in 1891, he entered the House of Lords, as the Duke of Devonshire, and after the formation of Gladstone's fourth and last ministry, in 1892, he formally supported Lord Salisbury, protesting against the "conspiracy of silence" on the Home Rule bill, and opposing that measure on the ground that it would create a popularly controlled administration not answerable to Parliament. He moved the rejection of the Second Home Rule bill in the House of Lords, and was supported by a majority of more than ten to one. In 1895 he openly allied himself with the Conservatives by accepting the office of Lord President of the Council in Lord Salisbury's cabinet, and he afterward became president of the Council of Imperial Defense. Although he continued to assert his confidence in the theory of free trade, he accepted, in a general way, Mr. Chamberlain's economic conception of what the British Empire should be, and conceded that that scheme must be worked out along commercial lines. But he opposed the idea of a general tariff, or any system favorable to the colonies which involved taxation of food supplies; he strongly disapproved of Mr. Balfour's ambiguity and evasion, and finally, in Oct., 1903, resigned his office because of the prime minister's failure to make "a definite statement of adherence to the principle of free trade as the ordinary basis of our fiscal and commercial system, and an equally definite repudiation of the principle of protection in the interest of our national industries."

DE WITT, CALVIN. An American military surgeon, died at Fort Yellowstone, Wyoming, on September 3, 1908. He was born at Harrisburg, Pa., on May 26, 1840, and graduated at Princeton in 1860. He was studying medicine at the beginning of the Civil War but gave up his studies

to enter the army, serving as captain of a Pennsylvania regiment until 1863, when he resigned. He then completed his medical preparation, served in the last days of the war as assistant surgeon of volunteers, and in 1867 obtained a like commission in the regular army, serving until he was retired in 1903 with the rank of brigadier-general. During the Spanish War he organized the United States General Hospital at Fortress Monroe.

DIAMONDS. The occurrence of diamonds in the southern part of Africa seems to be widespread. Not only have new alluvial deposits been found in the more remote regions, but the number of known volcanic pipes—the original home of the South African diamond—has been increased by some remarkable finds. The discovery of the Premier mine, near Pretoria, a few years ago, ranks as the most important of those under actual exploitation, though it was reported on good authority that a pipe found in 1908 at Bembesi, 38 miles northeast of Bulawayo, even exceeded the Premier in size. Little information was available regarding the richness of the mine. A second pipe in the same vicinity was said to have shown an average of 30 carats to 100 loads (a load is 16 cubic feet) from the surface material. At Somabula, 12 miles from Gwelo on the railroad from Bulawayo to Salisbury, alluvial deposits were under operation. Another discovery was reported from the vicinity of Lüderitz Bay, German South-West Africa, where the diamonds occur in quartzose detritus. Of interest in connection with the origin of the South African diamond was the occurrence described in the Roberts Victor mine at Boshof, Orange River Colony during the year. The diamond-bearing yellow ground of that mine often contains nodular masses consisting of garnet, green pyroxene and cyanide. In one of these masses a number of diamonds were found. The so-called eclogite found in the older mines of the region had the same composition, but the occurrence of diamonds in it was disputed. The masses appeared to be of concretionary character, formed probably by segregation in the volcanic magma, so that the presence of diamonds seemed to give strong support to the theory that the stones are original crystallizations in place and have not been introduced from some foreign source.

AMERICAN DIAMONDS. Additional details regarding the discovery of diamonds near Murfreesboro, Pike County, Arkansas, were made public. This is the first locality on the American continent where the diamond has been found in its original rock matrix, though isolated specimens occurring in loose surface materials had been reported from time to time from different places in the United States and Canada. According to an investigation by G. F. Kunz and H. S. Washington, the matrix of the Murfreesboro diamonds is a vitreous peridotite, forming a stock or volcanic neck which has broken through Carboniferous and Cretaceous quartzites and sandstones. The rock is of dark greenish color and composed of olivine, biotite, augite, perovskite, and magnetite, with a glass base. It resembles the kimberlite of South Africa, though unlike the latter it is not brecciated and contains no inclusions. Atmospheric weathering has decomposed the stock for some distance from the surface, producing green and yellow "grounds" which disintegrate rapidly on exposure. The outcrop of the neck forms a

rough ellipse, measuring 1,800 and 2,400 feet along the shorter and longer diameters, respectively, and occupies an area of about 40 acres. About 300 diamonds were found in the surface material, all within the limits of the igneous area. One specimen was taken from the green ground, at a depth of 15 feet, under conditions that left no doubt as to its having been actually in place. Regarding the size, color, and quality of the stones, an examination of 200 carats showed that they would compare favorably with most, if not all, the diamonds from the South African mines. The largest stone weighed 6.5 carats. A large proportion were white and for the most part grading high in color, brilliancy, and freedom from flaws. Tests were instituted to determine the average yield of the rock, which seemed to be the only uncertain element respecting its value.

THE CULLINAN DIAMOND, believed to be the largest ever found, weighing 3,024 carats in the rough, was successfully cut during 1908 by an Amsterdam firm. It yielded over 100 polished stones of which the largest, in the shape of a pendeloque or drop-brilliant, weighed 516½ carats, and the next in size, a square brilliant, weighed 309 3/16 carats. The size of these stones can be better appreciated when compared with the celebrated Kohinoor which has a weight of 106 carats. All the stones are without flaw and of the finest blue-white color. The two larger ones were cut with 74 and 66 facets respectively, while the usual number is 58 facets. The Cullinan diamond was found in the Premier mine in 1905 and was purchased by the Transvaal government for presentation to King Edward VII. See **CHEMISTRY, INDUSTRIAL**, section on *Artificial Gems*.

DISCIPLES OF CHRIST. The people known as "Disciples of Christ," or "Christians," sometimes denominated "Campbellites" after Alexander Campbell, of Bethany, W. Va., had their origin in Western Pennsylvania. Thomas Campbell issued his celebrated Declaration and Address in that year, and in 1811 the first church was organized. From 1827 may be dated the rise of this body as a distinct organization. In 1831 the movement of Barton W. Stone in Kentucky and that of Campbell were united, the purpose being the union of Christians on the foundations of the Original Apostolic Church, or the restoration of the ancient order of things as found in the New Testament. The growth of the denomination has been rapid. According to statistics for 1908, the number of churches was 11,654; ministers, 6,833; communicants, 1,330,980; Sunday Schools, 8,962, with 927,783 pupils; church property, \$30,000,000. With but two exceptions there are churches in every State in the Union, but their strength lies chiefly in the Middle West and South. There are many churches in Australia and other parts of Great Britain. The receipts for missions, 1908, are over one million of dollars, and for education and benevolence a half million more. Their Foreign Society has flourishing missions in China, India, Japan, Africa, Cuba, Scandinavia, Tibet, and the Philippines. Its income was \$274,324. The American Christian Missionary Society conducts domestic missions and received \$123,755, sustained 344 workers, and added to the churches 16,743. There is also a Christian Woman's

Board of Missions, which supports missions at home and abroad, and whose receipts were \$295,630. The Disciples rank third among the religious bodies in the number of Christian Endeavor Societies. They have many strong educational institutions, as Bethany College, W. Va.; Hiram, Ohio; Transylvania University, Lexington, Ky.; Drake University, Des Moines, Iowa; Eureka College, Eureka, Ill.; Butler University, Indianapolis, Ind.; Christian University, Canton, Mo., and many others. Their last National Convention was held in New Orleans. Their Centennial will be observed Oct., 1909, in Pittsburgh, where 50,000 delegates are expected.

DISEASES OF ANIMALS. See VETERINARY MEDICINE.

DISTRICT OF COLUMBIA. That portion of the Federal domain which is the seat of the government of the United States. It is coextensive with the City of Washington. It was organized on Mar. 30, 1791, when a concession of land amounting to 100 square miles was made to the United States by the States of Maryland and Virginia. It originally included two counties, Washington and Alexandria, but the latter was ceded to Virginia on July 9, 1846, and in 1874 the county government at Washington was abolished. The gross area is about 60 square miles. The population in 1905 was 302,833. A census was taken on April 8, 1908, which showed the total population of the District to be 339,403, including 97,483 colored.

FINANCES. The receipts from all sources of the District of Columbia, for the fiscal year ending June 30, 1908, were \$13,048,968, including a cash balance from the fiscal year 1907 of \$477,159. The expenditures for the same period were \$12,717,740, leaving a cash balance on July 1, 1908, of \$331,187. The chief sources of revenue were as follows: Taxes and other general revenues, \$5,494,447; trust and special fund collections, \$1,079,258; United States payments from appropriations, \$5,690,963.

EDUCATION. The main interest of the District of Columbia is public education, and it calls for the largest amounts in the estimates of appropriations. The recommended appropriations for the fiscal year 1909 were \$4,696,340, which is a considerable increase over the expenditures for 1908, and results from the statutory increase in the pay of teachers and others in the public schools, and from the sum required for additional buildings and grounds, for which purpose \$2,218,500 was asked. During 1908, special efforts were made by the Commissioners and Board of Education to improve the condition of the school buildings, especially with a view to better protection against fire and panic, and unsanitary conditions. During the fiscal year, nine school buildings were completed, and progress has been made upon three others authorized by Congress. The total enrollment of pupils in 1908 was 57,013, of whom 53,359 were in day schools and 3,654 in night schools. There were 1,691 teachers, of whom 1,596 were in day schools and 95 in night schools. The Commissioners of the District, in their annual report of 1908, asked for the sum of \$75,000 for the purchase of public playgrounds. The sites already purchased for this purpose have been most profitably used.

MUNICIPAL CONDITIONS AND PROGRESS. The formal opening of the new District Government Building was celebrated on July 4, 1908, in connection with the 131st anniversary of the Dec-

laration of Independence. Addresses were made by the Speaker of the House of Representatives, the Secretary of the Treasury, and representatives of the Washington Board of Trade, the Washington Chamber of Commerce, the President of the Board of Commissioners of the District of Columbia, and others.

The estimated value of building work during the year, not including buildings of the United States government, was \$8,711,557, which was a decrease over the value of building work during the preceding fiscal year of \$4,000,895. The number of dwelling houses constructed was 1,224, a decrease of 27 over the figures of 1907. 135 business buildings were erected, being a decrease of 42 over the previous year. On May 23, 1908, an act was passed authorizing certain extensions to be made in the street railway lines in order to reach the new Union Station. The bill authorized temporary tracks and required that permanent construction should be completed on or before May 1, 1909. The work of installing this construction progressed rapidly during the year. The appropriation of \$15,000 for the care and maintenance of Rock Creek Park, was spent in the general care and maintenance of roads, bridle paths, and open spaces. The Commissioners asked an appropriation of \$2,500 for the fiscal year 1909, which will provide for the care and maintenance of the park, and also for constructing an approach to the park in Biddle Parkway near Sixteenth Street along the valley of Piney Branch, for which ground was acquired during the year. Bills were pending in Congress at the end of the year for the purchase of additional land for a park. The plans for expansion and beautification of Washington included the projects of the improvement of Rock Creek Valley and the Anacosta Basin, and conversion of the property between Pennsylvania Avenue and the Mall into a park where the national government may erect the buildings which it will need in the future. The latter project is already begun, by the appropriation of \$2,500,000 by Congress at the last session for the acquisition of the square between Fourteenth and Fifteenth streets. The Commissioners approved the plan to have the United States purchase all the land between its present holdings around the Capitol and the Union Station so as to make a park between the two. The new buildings for offices of the Senate and House were brought to completion during the year.

HEALTH AND SANITATION. Special efforts were made during the year for the improvement of the health of the District of Columbia. The presence of leading health officers and sanitary experts at the International Tuberculosis Congress, held at Washington in October, brought gratifying commendation of the work already done by the health department. Congress has provided for the registration of tuberculosis cases in the District. The death rate during the year was 19.25, which was a trifle lower than the preceding year, 19.35. Deaths among white people showed a death rate of 15.55 and among the colored population, 28.22. Tuberculosis caused more deaths than any other one factor, and the colored race suffered most severely from the ravages of this disease. Typhoid fever continued to occur during the year, though the causes for its prevalence had not been accounted for by the most diligent search.

CHILD LABOR. An act was passed by Congress on May 28, 1908, regulating the employment of

child labor in the District. It provides that children of a certain prescribed age shall not be employed unless they have approved age and schooling certificates, and it provides also that no age and schooling certificates shall be approved unless satisfactory evidence is furnished by duly tested transcript of birth, or by certain other specific evidence, showing the place and date of birth. The law provides further that the certificates referred to shall show that the child has reached the normal development of a child of his age and is in sound health and physically able to perform the work which he intends to do. See CHILD LABOR.

NEEDS OF THE DISTRICT. The Commissioners in their annual report ask for appropriations for the following purposes: Public school buildings and grounds; high pressure fire protection service in the heart of the city; the improvement of Rock Creek Valley; the improvement of Anacostia River and Washington harbor front; additional suburban sewers, and completion of the Piney Branch Bridge. They also urged the passage of the civil service law, a law regulating assessment on life insurance, the repealing of the law authorizing the watering of the stock of the gas companies, the reduction in the price of gas; authority for branches of the public library under the Carnegie promise of branch buildings; further improvements in the charity system; regulation of all public corporations; the improvement of the liquor law; the teachers' annuity bill; and a bill to regulate loan agencies.

OFFICERS. The Commissioners of the District of Columbia in 1908 were: Henry B. MacFarland, President; Henry L. West, and J. J. Morrow.

DIVORCE. Probably the most important contribution to the discussion of the subject of divorce during 1908 was the publication by the Bureau of the Census of the Department of Commerce and Labor of a report on Marriage and Divorce for the twenty years 1887 to 1906 inclusive. This report was similar to one covering the preceding twenty years, 1867 to 1886, thus making available detailed statistics of divorces in the United States during forty years. The data were obtained by a large body of clerks from the permanent Census Bureau making direct examination of the records of local courts throughout the country. Only the briefest possible summary of results can here be given.

During the period under investigation, 1887 to 1906 inclusive, there were recorded 12,832,044 marriages. The annual number rose from 483,069 in 1887 to 853,290 in 1906. The increase however was not uniform, the numbers being very sensitive to industrial conditions. Thus there was only a slight increase over the preceding year in 1893 and an actual decrease in 1894 and in 1904. The increase was most marked in 1895, in the years 1900 to 1903 inclusive, and in 1906. This inquiry makes possible for the first time an approximately correct estimate of the marriage rate in the United States. On the basis of the total population this rate was 9.1 per 1,000 in 1890 and 9.3 per 1,000 in 1900. On the basis of the adult unmarried population (i.e. single, widowed and divorced, fifteen years of age or over) the rate was 31.6 per 1,000 in 1890 and 32.1 per 1,000 in 1900. This rate in 1900 by divisions of states was as follows: South Central, 43.6; South Atlantic, 35; North Central, 32.2; Western, 27.3; North Atlantic, 26. Of ten States showing rates above 40 per 1000 of adult marriageable population, all but Utah were southern.

The inquiry was, however, devoted mainly to the subject of divorce in the United States. The total number reported for the twenty years 1887-1906 was 945,625, as compared with 328,716 for the twenty years 1867-1886. By five-year periods the numbers reported were: 1867-71, 53,574; 1872-76, 68,547; 1877-81, 89,284; 1882-86, 117,311; 1887-91, 157,324; 1892-96, 194,939; 1897-1901, 260,720; 1902-6, 332,642. The percentage increases in divorces granted as compared with percentage increases in population were as follows by decades: 1870-1880, population 30 per cent., divorces, 79 per cent; 1880-1890, population 25 per cent, divorces 70 per cent; 1890-1900, population 21 per cent., divorces 66 per cent.; 1900-1906, population 10.5 per cent. (est.), divorces 29.3 per cent. The data indicated that not fewer than 1 in every 12 marriages ultimately terminated in divorce. The report states that divorce rates are higher in the United States than in any other country supplying statistics of them.

The divorce rate by States shows wide variations. By divisions of States the rates per 100,000 married population were as follows in 1900: Western, 356; South Central, 279; North Central, 255; North Atlantic, 100; South Atlantic, 98. On this same basis the rates for States showing largest average numbers for the years 1898 to 1902 inclusive were as follows: Washington 513; Montana, 497; Colorado, 409; Arkansas, 399; Texas, 391; Oregon, 368; Wyoming, 361; Indiana, 355; Idaho, 347; Oklahoma, 346; Arizona, 344; Indian Territory, 326; and Nevada, 315. States reporting the fewest numbers per 100,000 married population during the same five years, 1898-1902 were as follows: Delaware, 43; New York, 60; New Jersey, 60; North Carolina, 75; Georgia, 78; and Pennsylvania, 94. These results are not in all cases truly representative, owing to the frequent migration of parties seeking divorce from the state in which the cause for divorce arose to some state where divorce is easier. Nevertheless such states as South Dakota, which have achieved some notoriety on account of these migratory divorces, do not show excessive numbers. Thus South Dakota reported only 270 on the above basis, a number exceeded by seventeen States, including Maine, New Hampshire, Rhode Island, Kansas, Missouri, Utah, and California, besides those already enumerated. Moreover most of the other North Central States reported almost as many. Among the causes of the variations among the States are given the composition of the population as regards race or nationality; the proportion of immigrants and the countries whence they came; religious belief, especially prevalence of Catholicism; variations in divorce laws and court procedure; and interstate migration.

Classified on the basis of libellant, the results showed that almost precisely two-thirds of the divorces were granted to the wife. This proportion remained very constant throughout the entire forty years 1867-1906. Non-support or neglect to provide was the ground for 34,664 divorces granted to wives during the twenty years 1887-1906, but of only 6 (all in Utah) granted to husbands. So also cruelty was the stated cause in five times as many divorces granted to wives as to husbands. The proportion granted to husband and to wife vary greatly among the States. The proportion granted to wife during the entire period by divisions was as follows: Western, 72.3 per cent; North

Central, 71.7; North Atlantic, 68.8; South Central, 56.2; and South Atlantic, 53.1. In four southern States, Virginia, North Carolina, Alabama, and Mississippi, more divorces were granted

to husband than to wife. The following table presents a classification of divorces both with regard to stated causes for divorce and to whom granted.

Cause	Divorces: 1887 to 1906.					
	Total		Granted to husband		Granted to wife	
	Number	Per cent. distribution	Number	Per cent. distribution	Number	Per cent. distribution
All causes	945,625	100.0	316,149	100.0	629,476	100.0
Adultery	153,759	16.3	90,800	28.7	62,869	10.0
Cruelty	206,225	21.8	33,178	10.5	173,047	27.5
Desertion	367,502	38.9	156,283	49.4	211,219	33.6
Drunkenness	36,516	3.9	8,436	1.1	33,080	5.3
Neglect to provide	34,670	3.7	6	(1)	34,664	5.5
Combinations of preceding causes,	88,849	9.4	14,330	4.5	74,519	11.8
All other causes	58,104	6.1	18,026	5.7	40,078	6.4

¹ Less than one tenth of 1 per cent.

Special effort was directed toward ascertaining the extent to which drunkenness was a direct or an indirect cause of divorce. As the table indicates it was the sole ground in 3.9 per cent. of all cases. It was combined with other causes in 1.9 per cent. of all cases, thus making it an immediately assigned cause in 5.7 per cent. of all cases. Careful searching of the records of individual cases showed that in at least 130,287 or 13.8 per cent of all divorces, intemperance was an indirect or contributory cause. It resulted that intemperance was a cause, direct or indirect, in 6.1 per cent of the divorces granted to the husbands and in 26.3 per cent, of those granted to wives. In those cases where intemperance was only an indirect cause, cruelty was most frequently the direct cause. It was a contributory cause also in many divorces granted to husbands on the ground of adultery and to wives on the ground of neglect to provide.

The average duration of marriages terminated by divorce during the twenty years, 1887-1906 was 9.9 years. Nevertheless, 28.3 per cent. of the marriages lasted less than five years, and 59.7 per cent. of them lasted less than ten years.

In most cases separation precedes divorce. An effort was made to ascertain the time elapsing between marriage and separation. This was learned in the case of 770,929 couples, or four-fifths of the total number. The results showed that fully 12.7 per cent. of divorced couples separated in the same calendar year in which married, and 14.2 per cent. in the following year, while 57.8 per cent. separated within five years. However, 3.1 per cent. separated only after twenty-five or more years of married life. Almost four-fifths (78.5 per cent.) of all divorces were granted within five years after separation of the married couple.

The existence of children constitutes one of the most important features of divorces cases. During the twenty years covered by this report, 39.8 per cent. of the cases reported children, 40.2 per cent. reported no children, and 19.9 per cent. made no report as to children. In the opinion of the Census Bureau, the failure to report as to children was equivalent in most cases to reporting no children. Among divorces granted to husbands, 26 per cent. reported chil-

dren, while among those granted to wives, 46.8 per cent so reported. Or classified with respect to children, the results show that in 77.9 per cent. of cases reporting children the divorce was granted to the wife, and only 22.1 per cent. to the husband.

A noteworthy piece of divorce legislation was the referendum vote in South Dakota, on a new statute. The new law provides that applicants who were married elsewhere, unless cause arose in South Dakota, must be *bona fide* residents of the State for at least one year, before they can institute proceedings. Parties married in the State and continuing to reside therein and parties for whom cause arose during residence in the State may bring suit at any time. All cases, except those relating to alimony and interlocutory decrees must be heard at regular terms of courts. This law aims to make divorce more difficult, and is thus in line with the general tendency of legislation in the United States. While divorce continued to be a topic of discussion throughout the year, little that was new was developed. Various viewpoints were represented by speakers at the annual meeting of the American Sociological Society in Baltimore, in December.

DIX, MORGAN. An American Protestant Episcopal clergyman, rector of Trinity Church, New York, died on Apr. 29, 1908. He was born in New York City, on Nov. 1, 1827, a son of Gen. John A. Dix. After graduating at Columbia College, in 1848, he entered the General Theological Seminary, where he graduated in 1852, was ordained deacon, and was raised to the priesthood in the following year. He was assistant minister at St. Mark's Church, Philadelphia, in 1852, and, returning to New York in 1854, joined the clerical staff of Trinity Church. He became assistant rector in 1860, and in 1862, was made rector, a post which he held for 54 years. He was president of the House of Deputies of the General Triennial Convention of the Episcopal church from 1888 until 1903. He received the degree of S.T.D. from Columbia in 1862, of D.C.L. from the University of the South in 1885, and of D.D. from Princeton in 1896 and from Oxford in 1900. He published several books on religious and devotional sub-

jects, including *The Bishop Paddock Lectures for 1892*, *The Bishop Paddock Lectures for 1901*, and a *History of the Parish of Trinity Church* (4 vols., 1908).

DOCKS. During the year 1908 the most important dock construction, as usual, was to be found in Europe, where the considerable rise and fall of tide and the more permanent construction of commercial facilities at harbors make such work more conspicuous and important than in the United States. Mention should be made, however, of the approaching completion of the Chelsea piers on the North River, New York, designed to accommodate the largest transatlantic liners and to provide adequate facilities for their cargoes and passengers. These piers have been constructed partly by excavating and dredging the slips into the land so as not to encroach beyond the pier line of the North River. Having obtained powers from Parliament to begin the construction of the new docks for the largest vessels entering the Port of Liverpool, the Mersey Docks and Harbor Board gave orders for the commencement of new works which were estimated to cost about \$15,000,000. The works in progress included a half-tide dock with a river lock 870 feet in length, which is 90 feet longer than either the *Mauretania* or *Lusitania*, and 130 feet in width, with adequate depth for the largest vessels. This half-tide dock will communicate with another dock connecting in turn with two new basins, and a new lock will be constructed to afford entrance to the Hornby and the old dock systems. At the port of Southampton progress was made on the construction of the new wet dock for the White Star Liners, which will have a water area of 16 acres, with a depth of from 35 to 40 feet. The new dock at Avonmouth, built by the Corporation of Bristol, was opened by King Edward in July at about the time of the 100th anniversary of the opening of the first dock at Bristol. This dock has an entrance lock 875 feet in length and 100 feet in width. In France the most important work was the construction of the Florida lock at the Port of Havre, which connects the Bassin de l'Eure and the Bassin Bellot with the outer harbor. This lock is about 854½ feet in length between the gates and is 98½ feet in width. Important progress was also announced on the large Alexandra Dock, at Bombay, India, which has been in construction since 1904. This dock will afford accommodation for vessels 1,000 feet in length, 100 feet beam, and a draught of 36 feet, and will cost, when completed, about \$73,000,000, or somewhat more than half of the total scheme of improvement for the port. There was to be a dry-dock for vessels of the same size and extensive warehouses and other improvements, the construction of which was involving important engineering work. During the year, the breakwater protecting the marine docks was completed.

DRY-DOCK. A large dry-dock was announced to be built at Antwerp, which will be 754 ft. long, 88½ ft. wide at entrance, and 32¾ ft. deep. It was expected that it will take three years to complete the structure.

DODGE, FRANCIS SAFFORD. An American soldier, distinguished as an Indian fighter, died on Feb. 10, 1908. He was born on Sept. 11, 1842, in Danvers, Mass., was educated in the public schools there, and at the Henneker (N. H.) Academy, and in 1861 enlisted as a private in the Twenty-third Massachusetts Infantry. He be-

came corporal in that regiment in 1863, first lieutenant in the Second United States Cavalry (colored) in 1863, captain in that regiment in 1865, and was honorably mustered out of the service in 1866. He reentered the service as a first lieutenant in the Ninth Cavalry (colored) in 1866, and became a captain in 1867. He entered the paymaster's department, with the rank of major in 1880, and was thereafter advanced to the rank of lieutenant-colonel (1901), colonel and assistant paymaster-general, and in 1904 paymaster-general, with the rank of brigadier-general, which post he held until he was retired, in 1906. Under command of Captain Dodge, in January, 1870, four troops of the Ninth Cavalry destroyed a large Indian Camp in the Guadalupe Mountains; but the exploit which made him famous occurred in Western Colorado, where, in September, 1879, at the head of troop D., of the Ninth Cavalry, he voluntarily made a forced march of more than 100 miles, to the relief of Major Thomas T. Thornburg, whose small force was surrounded by Indians near Mill Creek, and threatened with annihilation. Captain Dodge's troop fought their way through the Indians, joined Major Thornburg's men in their rifle pits, and held the Indians at bay until reinforcements arrived. During this uprising 11 citizens, 2 officers (including Major Thornburg) and 12 soldiers were killed, and 41 persons were wounded. For this feat, one of the most brilliant in Indian warfare, Captain Dodge was awarded the Congressional Medal of Honor, and was brevetted major (1890).

DOMINICA. A British island of the West Indies, forming a presidency of the Leeward Islands (q. v.). Area, 291 miles; population (1906), 31,943. Roseau, the capital, has about 6,000 inhabitants. The principal products are cacao, limes, coffee, fruit, and some sugar. In 1907-8 the imports and exports amounted to £128,650 and £124,294 respectively. The revenue in 1907-8 was £39,865; the expenditure, £31,486; and the public debt, £51,015. The administrator in 1908 was W. Douglas Young.

DOMINICAN REPUBLIC. See SANTO DOMINGO.

DRACHMANN, HILGER HENRIK HERHOLDT. A Danish poet and novelist, died on Jan. 14, 1908. He was born at Copenhagen, on Oct. 9, 1846, the son of a physician, whose family was of German descent; was educated in the University of Copenhagen, then studied painting in the Academy of Fine Arts there, and from 1866 to 1870 specialized in marine painting under Sørensen. About 1870 some of his verses attracted the attention of George Brandes, and from that time Drachmann devoted himself to literature. During this period he published such volumes as *Poems* (1872); *Muffled Melodies* (1875); *Young Blood* (1876); *Songs of the Sea* (1877), and *Over the Frontier There* (1877). In these earlier years of his career he wrote also several very graphic stories of sea life, such as *The Honor of a Sailor* (1878), *Paul and Virginia of a Northern Clime* (1879, trans. 1895); and *Lars Kruse* (1879). From about 1885 to 1892, Drachmann was the leader of the literary faction which upheld national patriotic conservatism, and opposed the individualistic and radical school of Brandes and his followers. Under these influences, Drachmann wrote religious and national poems, and between 1890 and 1900 he produced, in both prose and poetry,

much in passionate praise of liberty, and in denunciation of the bondage of the commonplace. Of the long list of his published works, the following are fairly representative: *East of the Sun and West of the Moon* (1880); *Strandby Folk* (1883); *Once Upon a Time* (1885); *Gurre* (1899); *Hallfred Vandradeskjald* (1900); and *The Green Hope* (1901). Though he interpolated romantic verse in his novels, Drachmann was essentially a realist. He published in 1899 an autobiographical novel, *Den hellige Ild*, which contains many fantastic and lyric improvisations. His translation (or paraphrase) of Byron's *Don Juan* is a creditable effort.

DRAINAGE. The year 1908 witnessed an unprecedented agitation for the better utilization of the natural resources of the United States. One of the greatest of these resources unused was the vast area of swamp and overflowed land. April 30, 1908, the Secretary of Agriculture made a report to the Senate as to the location and area of these swamp lands susceptible of being drained for agriculture, the effect of drainage of such lands, the area of land which has been drained under the laws of the different States, and the benefits which have resulted therefrom. Most of the data given below are taken from that report. The area of swamp and overflowed lands in the United States was estimated as about 79,000,000 acres. With reference to their productive value as affected by their natural wet condition, they may be classified as follows:

(1) Lands which are permanently wet and are never fit for cultivation, even during the most favorable years, nor afford profitable grazing for live stock. (2) Lands which afford pasture for live stock, though the forage they produce may be of indifferent quality. (3) Lands which in their natural condition are subject to periodical overflow by streams, but which at other times produce valuable crops. (4) Lands which during seasons of light or medium rainfall will yield profitable crops, but which are wholly unproductive during the seasons characterized by a greater than the normal rainfall.

The reclamation of swamp lands consists of three distinct operations:

(1) The construction of ditches or improvement of such drainage channels as will be required by a large number of landowners in common, which may appropriately be called public drains. They are made through the cooperation of owners under the provisions of State drainage laws. (2) Detailed drainage performed by landowners upon plantation or farm. (3) The subjugation of wild vegetation, the removal of stumps and other foreign material, and the preparation of the soil for cultivation.

The total increase in land values in the United States from drainage work was estimated to be \$1,593,633,155, and the value of the annual increased production, \$273,079,295. It was estimated that the following areas (acres) in the States named had been drained under the provisions of the State drainage laws:

Illinois, 3,496,000; Indiana, 3,358,000; Ohio, 3,400,000; Michigan, 1,600,000; Minnesota, 1,500,000; Iowa, 915,000; California, 700,000; Missouri, 350,000; Wisconsin, 200,000; Nebraska, 100,000; North Dakota, 150,000; Louisiana, 120,000; making a total of 15,889,000 acres. The United States Office of Experimental Stations, through its division of Drainage Investiga-

tions, continued to make surveys and plans for the drainage of large tracts in many States and to aid individuals and communities in planning and carrying out drainage projects. The amount of unreclaimed swamp and overflowed land in the United States, by classes, is as follows: Permanent swamp, 52,665,020 acres; wet grazing land, 6,826,019 acres; periodically overflowed, 14,747,805; periodically swampy, 4,766,179; total, 79,005,023 acres.

DRAMA. Comedy, largely of English origin, continued during 1908 to hold the largest place in the attention of the American play-going public. The only strikingly meritorious work of this class—Mr. Percy Mackaye's *Mater*—was virtually ignored. Several dramas of contemporary American life, such as *Paid in Full*, *The Wolf*, and *The Easiest Way*, all three by Eugene Walter, proved to be highly promising. Mr. Charles R. Kennedy's *Servant in the House* and *The Winterfeast* were also notable productions. Upon the whole, the year, while more interesting in its theatrical doings than its predecessor, offered but little of commanding importance. While in the record of 1907 the most notable plays offered were of foreign origin—Ibsen's *Peer Gynt*, the last production by Richard Mansfield, MM. Gavault and Charnay's *My Wife*, Bernstein's *The Thief*, and W. J. Locke's *The Morals of Marcus*, the plays of 1908 by American authors have been many. Mr. Percy Mackaye, who in 1907 produced *Sapho* and *Phaon*, an ambitious play in verse that was wrecked by incompetent interpretation, brought forward *Mater*, a comedy in which wit and good writing were sufficiently conspicuous to atone for much affectation. The part of "Mater," a woman of many foibles but keen good sense who lays bare the stupidities of those around her and yet retains everyone's regard, was capably drawn. *Mater*, however, was above the heads of the theatre-going public and failed to hold the stage.

The Servant in the House, by Charles Rann Kennedy, in which the author undertakes to tear the mask from clerical hypocrisy, proved to be a remarkable play, teaching the lesson of charity in an impressive fashion, and with enough humor and dramatic movement to make it of absorbing interest. The public, at first inclined to ignore it as too serious for consideration, became interested and made it one of the successes of the year among thinking people. Another play by Mr. Kennedy, a tragedy in verse, entitled *The Winterfeast*, a tale of early Iceland, resembling somewhat Ibsen's *Vikings* in atmosphere and treatment, failed to find popular support notwithstanding literary merit and a capital interpretation. Edith Wynne Mathison in the chief part acted with fine art, but the play's intense gloom was a fatal bar to public acceptance. The time of action, 1020 A. D., and the Iceland setting gave opportunity for stage pictures that offered a background of poetic beauty for this notable tragedy of love, revenge, and superstition that had something of the spirit and the power of a Greek drama.

The mention of Greek drama recalls the ambitious but futile attempt of Mrs. Patrick Campbell to revive interest in Sophocles' *Electra*. The version used by the English actress was a translation by Arthur Symonds of the adaptation by Hugo von Hofmannsthal which has had some success in Germany. The story used was that of Sophocles, but the essence of many

other Greek playwrights, especially Euripides, is found in the play. This *Electra* was a Nemesis, devoid of womanly weakness. Mrs. Campbell failed to sound the deep tragic note that would alone make such a play vitally impressive, and had evidently undertaken a task beyond her power. Her ambition was a praiseworthy one and the production was elaborate, Mrs. Beerbohm Tree coming especially from England to impersonate Clytemnestra. Still another Greek play of the year well done by the students of the American Academy of Dramatic Arts, was the *Chephoroi* of Æschylus (*The Libation Pourers*), of which the one performance given was an interesting experiment.

Mr. E. H. Sothern, who, now that Mansfield is no more, probably ranks as the foremost American comedian in ambition and achievement, brought forward a version of *Don Quixote* by Paul Kester that might have earned a warm welcome had its wealth of incident not been swamped by too many long speeches. In the attempts to get all the good things of Cervantes' romance into the play it suffered from inordinate length, and notwithstanding Mr. Sothern's efforts, dragged beyond public endurance. Another play of dignified purpose in which Mr. Sothern figured was Mr. Laurence Irving's dramatization of Dostoyevski's *Crime and Punishment*, which was produced under the title *The Fool Hath Said: There Is No God*. The pictures of Russian life were interesting, but the character of Rodion is too persistently the reflection of a morbid obsession to win sympathy. In quite another field Mr. Sothern won popular favor that may have atoned in part for the ill-success of the plays just mentioned. As "Dundreary," in a revival of the famous old farce, *Our American Cousin*, in which his father, E. A. Sothern, made fame and fortune half a century ago, he gave a delightful portrayal of the impossible fop that so amused a past generation of playgoers. His impersonation was criticized as lacking the subtler touches which made the elder Sothern's "Dundreary" inimitable; but its excellence as a whole was freely conceded.

Irene Wycherly, an English play, by Anthony P. Wharton, afforded Miss Viola Allen an opportunity to portray a woman, who, after extraordinary self-restraint under brutal treatment, makes her revolt dramatic and effective. It is a strong and, at times, unpleasant play, marred by certain unnecessary crudities of expression that went far toward robbing it of popular favor. The question as to how much a wife should endure at the hands of a vicious husband is treated with power and no little originality. Its incidental resemblance in theme to Hervieu's *Dédale* does not affect this latter quality.

Three plays by Eugene Walter brought a new writer into public notice. The first—*The Wolf*—is a melodrama of the Canadian Hudson Bay country life, in which a rascally American engineer comes to grief at the hands of a virtuous and muscular habitant who loves the girl upon whom the villain has designs. The vital scene of the drama, its *raison d'être*, is a desperate fight to the death and all over the stage between the two men. Having, as he supposes, killed his opponent by foul attack, the villain gets the worst of it when the "dead" man comes sufficiently to life to turn the tables. Aside from a rather clever picture of backwoods life

in upper Canada, the play has little in it beyond this fight which made its popular success. The same idea—a death struggle between the virtuous half-breed and a rascally opponent, is used in *Pierre of the Plains*, produced this season by Mr. Edgar Selwyn. The second of Mr. Walter's plays, and the most important, *Paid in Full*, sketches the downward career of a man—a weak and leaky moral vessel at best—who, beginning with stealing from his employer in order to feed a woman's vanity, grows from bad to worse. As a sociological study, the play is insignificant, but the dialogue is direct, the action of interest and some capital acting was done in the chief parts by Tully Marshall, Frank Sheridan, Ben Johnson, and Miss Lillian Albertson, a new actress of promise. Mr. Walter's third success, *The Easiest Way*, first seen in Washington, sketches in a vivid fashion the temptations under which a woman of good instincts may come to grief. It is a picture of modern conditions, in certain phases of society, drawn with skill and power. Miss Frances Starr played the chief part admirably.

Salvation Nell, a play dealing with slum life in New York, by Edward Sheldon, attracted popular attention, thanks to the acting of Mrs. Fiske in the part of a woman who, through the regenerating power of religious influence as exerted by the Salvation Army, arises from the gutter to help the poor wretches around her to decency, among them her repentant lover. Leopards are made to change their spots in too rapid and radical a manner for critical observers. The portrayal of life among outcasts of a great city, its brutalities and indecencies, is made with an accuracy and wealth of unpleasant detail that serves no obvious purpose. Mrs. Fiske, and Mr. Horace Blinn as the depraved scoundrel whose heart is changed when rum and disease have laid him low, both did excellent work. The acting alone made *Salvation Nell* endurable. Another play in which an outcast of the Bill Sykes type is reformed in miraculous and incredible fashion was *The Regeneration*, by Owen Kildare and Walter Hackett, in which that erratic but interesting actor, Arnold Daly, strove in vain to win public favor. A thief, drunkard, and bully supposed to be New York's Bowery at its worst, meets an angelic settlement worker, and in less than no time she has him on his knees reciting the Lord's Prayer. He has his ups and downs, but the end is never lost sight of. Figs are made to grow on thistles, and the crop is a fine one. Love, of course, works the miracle, love on both sides and equally preposterous.

Samson, an adaptation of a drama by Henri Bernstein, was brought forward by Mr. William Gillette, who struggled hard in a part for which he is temperamentally unfitted. A dock laborer of uncommon mental vigor makes a large fortune in stocks and marries a beauty who proves to be of very ordinary clay. Naturally the husband has a hard time of it. The man who tries to steal his wife away can be ruined by certain stock manipulations, and although these involved also the downfall of the ex-laborer, he does not hesitate, but, Samson-like, pulls down the financial temple he has spent his life building up. The chief rôle was beyond Mr. Gillette's power.

Successful plays of American life given during the year included *The Man from Home*, which, although laid in England, has as its protagonist a breezy Indianian, who twists the British lion's

as "Salvation Nell"

tail until it roars for mercy. Virtuous American homespun against the titled blackguard is the well-worn theme worked out by the authors, Messrs. Booth Tarkington and H. L. Wilson, with the aid of capital acting by Mr. William Hodge in the leading rôle. Also *The Battle*, by Cleveland Moffett, in which some bubbles of the socialist creed are pricked. In it Mr. Wilton Lackaye gives life to the figure of a millionaire who shows that when men become capitalists they cease to be socialists. A curious incident in the story of the stage year was the presentation of several versions of *The Devil*, a much over-rated comedy by the Hungarian playwright, Ferenc Molnar, whose *Devil* is a cynical gentleman devoted to the making of more or less amusing comments upon the frivolous proceedings of some very commonplace puppets. The notoriety of the play in this country was due more to clever advertising than to literary or dramatic merit. Some clever acting was done in it by George Arliss, but neither in the English versions nor in a German production employing Eugene Burg, was it anything but trivial. Of far more significance was an adaptation by C. F. Nirdlinger, of Echegaray's *El Gran Galeoto*, produced under the title of *The World and His Wife*, in which Mr. William Faversham did the best work of his career, and despite hurtful mannerisms, made a deep impression. The play is a study of the evils of calumny, is admirable in dialogue and full of effective incident.

The most popular pieces in the domain of light comedy seen in 1908 were of English origin. Mr. Barrie's *What Every Woman Knows* deserves first place. As a young Scotchwoman, who makes the world around her brighter and better, helping her lover to make a success, but leaving the credit to others, Miss Maude Adams made much of a part in which humor and pathos are deftly mingled. Richard Bennett in the part of a blockhead who doesn't know that he owes his success to his devoted sweetheart, fully shared with Miss Adams the honors of a successful production. What every woman knows, according to Mr. Barrie, is that all men are children and must be humored accordingly. Upon this theme he constructs the comedy of the year. Miss Adams previously (January, 1908) did some nice work in *The Jesters*, an adaptation of *Les Bouffons*, a poetic romance of much merit by Miguel Zamacois, in which she played a Prince Charming part with delicacy. Both play and acting proved to be of rather too fine quality for public taste. Another original play, *The Mollusc*, by Hubert Henry Davies, which London heralded as a masterpiece, proved to be nothing of the kind, but a pleasant sketch of how a woman with good looks and brains may cajole the men around her into willing slaves. Its points were cleverly brought out by Miss Alexandra Carlisle, who showed in amusing fashion how laziness may be made to figure as a virtue.

Mr. John Drew's annual contribution to the gaiety of the country was made in a comedy by the prolific W. S. Maugham, the English playwright, whose *Jack Straw* gave the veteran actor a part of which he made the most. As an exiled nobleman disguised as a waiter, petted by upstarts and then reviled as an imposter, he played with his accustomed nonchalance. In *Lady Frederick*, another of Maugham's comedies—none of which appear to be deep, but all fairly sparkling—Miss Ethel Barrymore did the best work of her career. Her portrayal of an arti-

ficial, irresponsible, yet keen-witted woman of kindly impulses was an admirable one. Less artificial, and also amusing in detail, was an adaptation by Miss Gladys Unger of MM. De Flers and Caillavet's *L'Amour Veille*, played under the title of *Love Watches*, with Miss Billie Burke in the chief part, that of a vivacious young woman who believes that her husband has been unfaithful and resolves to pay him back in the same coin. Miss Burke, who plays with delicacy a difficult part, was ably helped by Mr. Ernest Lawford, the versatile English actor whose Hook in *Peter Pan* will be remembered as a capital performance. Also in the field of light comedy, but of less value than the plays just mentioned, was *The Chaperone*, by Marion Fairfax, with which Miss Maxine Elliott opened her new theatre in New York. It is supposed to be a comedy of American manners—often very bad manners—but offered entertainment of an innocuous sort. Earlier in the year Miss Elliott appeared in a play by Miss Rachel Crothers, called *Myself—Bettina*, a New England version of *Magda* that failed to interest the public. That ambitious and excellent actor Otis Skinner appeared in *The Honor of the Family*, an adaptation by Paul M. Potter of Émile Fabre's comedy founded upon Balzac's "Ménage de Garçon."

The new farces and very light comedies of the year were many and of the usual calibre—commonplace in idea and trivial from any point of view except that of the box office. Only three achieved sufficient popularity to need mention—George Ade's *Father and the Boys* (William H. Crane), *The Blue Mouse*, an adaptation by Clyde Fitch of a German original, and *Girls*, still another Fitch play, also from a German source.

Plays of slight importance that may be mentioned for purposes of record, were: *The Royal Mounted*, by William C. DeMille (Cyril Scott); *Agnes*, by Mrs. Sidney Drew (Miss Nance O'Neill); *Glorious Betsy*, by Rida J. Young (Mary Mannering); *The Offenders*, by Elmer B. Harris; and *Diana of Dobson's*, an English play by Miss Cicely Hamilton, in which Miss Carlotta Nillson appeared. Of rather more ambitious quality were *A Gentleman from Mississippi*, by Harrison Rhodes and Thomas A. Wise; *Mary Jane's Pa*, by Miss Edith Ellis; and *The Traveling Salesman*, by James B. Forbes.

No foreign stars of the first magnitude visited the United States during the year. Madame Komisarzhewsky, a Russian actress of some merit, appeared in several plays of Ibsen, in Gorky's *Children of the Sun*, Suderman's *Magda* and *Fires of St. John*. Her language, however, proved a bar to popularity. A company of actors from Dublin gave a number of Irish plays and sketches that appealed but slightly to our public. Finally a company of Sicilian players offered gruesome tragedies acted with crude power and unpleasant realism. London appears to have found much to admire in their work, but this country declined to become interested. A new German theatre was opened in New York, making two German houses with competent stock companies.

During the year the building of New York's New Theatre, designed to help dramatic art by the production of good plays whether financially profitable or not, went on apace, and dedication ceremonies were held in the half-completed structure. Winthrop Ames, of Boston, was made manager, and John Corbin, of New York, literary ad-

viser of the enterprise. Much criticism of the building was expressed on the ground that it is too large for anything but spectacular pieces, and, therefore, a failure for the purposes intended. Inasmuch as comedies and domestic dramas constitute nine-tenths of the American dramatists' output, the point seems to be well taken. The New Theatre was to be opened in the autumn of 1909.

London's new plays during 1908 included Mr. Shaw's *Getting Married: a Conversation*, brilliant in dialogue of the Shaw type, but devoid of anything like dramatic structure. Mr. Shaw predicted that the critics would be irritated and bored by his play; so far as London was concerned, they agreed with him. *Diana of Dobson's*, already mentioned, was a play in which Miss Cicely Hamilton shows how an impossible shop girl may enjoy life when a legacy comes her way. *Lady Epping's Law Suit*, by Davies, was too trivial to pass muster notwithstanding the excellent acting of Miss Mary Moore. Jerome K. Jerome's *Passing of the Third Floor Back*, based on one of this writer's short stories, tells in amusing fashion how a whole house full of reprobates are convicted of various sins and encouraged to reform. *Idols*, dramatized from W. J. Locke's novel, and *Mrs. Dot*, a society sketch by W. S. Maugham, were both well received, the latter having the advantage of Miss Marie Tempest in the chief part. While Alfred Sutro's *The Builder of Bridges* failed to equal his *Walls of Jericho*, London received it with favor, thanks largely to Miss Irene Van Brugh. *Marjorie Strobe*, by A. E. W. Mason, a story of Devonshire during the early part of the last century, made no impression. Mr. Forbes Robertson and Miss Gertrude Elliott produced a three-act comedy by Henry James, *The High Bid*, a graceful and well written little play devoid of stage vitality.

In France Mr. Alfred Capus broke away from the traditions of the French stage in making the chief figure of *Les Deux Hommes* a woman who is fascinatingly clever, but morally beyond reproach. In both Bourget's *L'Émigré* and Bernstein's *Israel* there is a boy who does not discover his real father until he has grown to manhood. In *Israel*, a conflict between Jew and Catholic is the theme. Mme. Réjane and De Max did exceptional work in it. Bourget's *Un Divorce* is a strong plea for the indissolubility of marriage, which was much applauded. *L'Autre*, by Paul Marguerite, supports the other and popular side of the question with literary and stage art. Among the plays of lighter calibre have been *Qui Perd Gagne*, by Pierre Veber, upon a novel by Capus, and a dramatization by Pierre Loti of his own *Ramuntcho*, that proved to be delightful. See FRENCH LITERATURE.

DREDGING. A Fruhling dredge for the improvement of the Fraser River, British Columbia, Canada, was purchased by that government at a cost of \$300,000. This type of dredges was of comparatively recent date, the system of excavating under water by this means having been invented by Otto Fruhling, of Braunschweig, Germany. In this method a large dipper dredge bucket, or a scraper of some sort, is fitted to the further end of the suction pipe so as to scrape up and collect the material to be dredged before it enters the suction pipe. The

results from this have been remarkable, giving the most powerful and economical dredging appliance known. The addition of the bucket head produces a greatly increased supply of sand and mud to the suction end of the pipe, and so completely prevents the admission of surplus water that pressure water connections had to be fitted to the inside of the bucket head, that enough water could be introduced to liquefy the material when too solid in character, so that it could be conveniently handled by the suction pump. Valves are therefore added to the bucket head, or scraper, to permit the inflow of water when so desired by the operator. In the interior of this scraper the dredged material is forced into a mixing chamber before it comes into range of the suction, where it is reduced to a uniform consistency by the pressure water or by the mere admission of outside water. From the mixing chamber, the material is drawn through the suction pump and discharged into the hopper. The material so discharged is a dense black or gray semi-fluid, somewhat like mortar in consistency, and in soft muddy and earthy material it is found possible to pump 90 per cent. of solid material as against 15 to 20 per cent. by the older forms of dredges. Where coarse sand is encountered, 50 to 70 per cent. of solid material is obtained, as against 10 to 15 per cent. by other dredging machines. The dredge is operated as follows: The head or scraper is dragged over the bottom at a speed of 4 or 5 knots, and thus made to scrape a strip 12 to 18 ft. wide, 12 to 18 in. deep. The material thus plowed up is forced into the bucket by the pressure of the scooping action, here kneaded, mixed, and liquefied, and finally sucked up by the pump.

Dredging operations in 1908 were in progress on the South West Pass of the Mississippi River, as was the case for three years previous, between the jetties. The U. S. dredge *Benyuard* was operating on the outer bar, and just above in the lower part of the shoal water above the jetty contraction. It was proposed to dredge a channel 35 ft. deep, 500 ft. wide at the bottom, and 22,400 ft. long, to connect the 35 ft. depth above with that between the jetties. Two 20-inch suction dredges with cutter heads and discharge pipes, 1,500 and 1,700 ft. long, were operating on the upper portion and have completed about 5,000 ft. of it. The United States dredge *Clatsop*, which was to be used upon the river improvement operations along the Columbia and Willamette Rivers near Portland, Oregon, started on its 17,000 mile trip around the Horn, which for a vessel of this class is a considerable undertaking. The dredge is 185 ft. long, and it is estimated at an average speed of 8 miles an hour it will take, making allowance for coaling, etc., nearly four months to complete the journey.

Hydraulic dredges were being used in the undertaking of reclaiming land for Lincoln Park, Chicago. It was proposed to fill in a large area of low-lying land north of the present park by this means, the material being taken from the bottom of Lake Michigan. The area to be filled extended for a distance of one mile along the shore front, and back from it for 1500 feet, requiring 4,000,000 cu. yds. for the filling. The dredges work partly in water which has a depth of 18 feet, and discharge on the land through pipes 30 inches in diameter. Heavy dredges known as stone

From the plans of Carrere and Hastings, Architects

THE NEW THEATRE
NEW YORK CITY

lifters were used on the St. Lawrence ship canal, two during 1908 being operated to remove boulders which are found to be too large for an ordinary dredge to handle. Each consisted of a wooden hulled boat, with a well in the middle, through which the large 60-ton capacity tongs are made to descend to the bottom. Here they engage the stones, which are raised on to the deck by a hoisting engine located aft.

For the harbor improvement of Liverpool the *Leviathan*, the new Mersey docks and Harbor Board dredge of 8,500 tons, the largest dredge in the world was constructed by Messrs. Gammell, Laird & Co., at Tranmere. This enormous suction dredge is capable of raising 10,000 tons of sand in 50 minutes.

DRURY-LOWE, SIR DRURY CURZON. A British soldier, died on April 6, 1908. He was born in Derbyshire on January 3, 1830, and after taking his degree at Corpus Christi College, Oxford, entered the army in 1874 as a cornet in the 17th Lancers. He served in the Crimea, in India at the time of the mutiny, and in the Zulu and Transvaal campaign in 1879-81. He commanded the cavalry division in the Egyptian campaign of 1882. He was inspector-general of cavalry at Aldershot from 1885 to 1891 and retired from active service with the rank of lieutenant-general.

DUDLEY, WILLIAM HUMBLE WARD, Second EARL OF, Governor-general of Australia. He was born on May 25, 1866, and was educated at Eton, after which he travelled around the world and in 1899-1900 served with the Imperial German Cavalry in South Africa. He was parliamentary secretary to the Board of Trade in 1895 and lord lieutenant of Ireland in 1902-06. He succeeded Lord Northcote as Governor-General of Australia (q. v.) in 1908, assuming office in September.

DUNKERS OR DUNKARDS. See BRETHREN, CHURCH OF THE.

DUTCH EAST INDIES. The area and population of the possessions of the Netherlands in the Malay Archipelago are as follows:

	Area sq. miles	Popula- tion, 1905
Java and Madura	50,775	30,098,008
Sumatra, West Coast	31,788	1,308,471
Sumatra, East Coast	35,480	568,417
Benkulen	15,556	413,301
Island of Tapanoei	16,251	204,269
Sumatra. Lampongs	11,338	156,518
Palembang	53,716	796,354
Atjeh (Achin)	20,549	582,175
Riau-Lingga Archipelago	16,378	112,216
Banca	4,473	115,189
Billiton	1,870	36,858
Borneo, West Coast	56,060	450,929
Borneo, South and East Districts	157,585	782,726
Island of Celebes	49,405	1,397,200
Celebes. Menado	22,176	436,406
Molucca Islands	44,038	407,419
Timor Archipelago	17,782	308,600
Bali and Lombok	4,063	523,535
New Guinea to 141° E. Long.	152,428	240,000
Total	748,340	38,938,000
Total, 1900		37,734,000

In 1900 there were 75,833 Europeans and Eurasians, mostly Dutch; 537,000 Chinese, 27,000 Arabs, and 17,000 other Orientals. In 1905 there were 80,873 Europeans. The principal cities, with their populations in 1905, are: In Java, Batavia, the capital, 183,551; Surabaya, 150,198; Surakarta, 100,667; in Sumatra, Palembang, 60,985; in Borneo, Banjarmasin, 16,708; in Celebes, Macassar, 26,145. There are public elementary and middle schools for Europeans, with about 20,000 pupils; government schools for natives, with 132,000 pupils; private schools for natives, with 95,000 pupils; and schools for foreign Orientals, with 12,000 pupils.

PRODUCTION, COMMERCE, ETC. The "culture system," introduced in 1832 and based on the compulsory labor of the natives in the cultivation of coffee, sugar, tea, indigo, tobacco, pepper, and other articles, is now confined to the cultivation of coffee. The "culture system" was never extended beyond Java and the neighboring island of Madura, the province of Sumatra, West Coast and the Residency of Menado, in Celebes. In the West Coast province the culture system was abolished March 1, 1908. (See SUMATRA.) In 1908 there were sold 18,220 bales of Borneo tobacco at Amsterdam at 31½ cents per one-half kilo, against 16,212 bales at an average of 40½ cents per half kilo in 1907. The exports of cotton in 1906 were 1,637,428 pounds of ginned cotton and 17,951,201 pounds of seed cotton. The production of coffee in Java and Sumatra in 1907 on Government account was 8,243,820 pounds, and on private account, 29,203,008 pounds. There are coal mines in Java (q. v.), Sumatra (q. v.), and Borneo. The tin mines of Banca are worked by the government; those of Billiton and Riau by private capital. Petroleum is obtained mainly in Sumatra, Java, and Borneo; the production in 1907 amounted to 1,178,797 metric tons. Sumatra also contains large deposits of tin and coal. There are saw mills, rice factories, arak distilleries, soap and ice factories, and printing offices. Dutch and foreign imports are treated alike. About three-fourths of the exports go to the Netherlands, with the exception of rice, of which a large amount is shipped to China. The total imports in 1906 amounted to 234,888,000 florins (1 florin=40.2 cents), and the total exports, 330,930,000 florins. Included in these totals were 11,061,000 florins' worth of imports and 16,250,000 of exports on government account. The principal exports in 1906 were: Sugar, 79,734,000 florins; tobacco, 57,599,000; copra, 18,012,000; coffee, 20,081,000; petroleum, 19,626,000; tin, 15,566,000; gutta-percha, 15,450,000; gum, 10,403,000; cinchona, 6,398,000; tea, 7,217,000; pepper, 8,564,000; rattan, 6,751,000; rice, 4,556,000; hides and skins, 4,158,000; nutmegs, 2,540,000. Direct shipments from the Dutch East Indies to the United States in 1907 amounted to \$17,638,431, mainly sugar. The length of railways in 1906 was 1,509 miles, of which 1,321 were in Java and 188 in Sumatra; of state telegraph lines, 8,640 miles. The merchant marine contained at the end of 1906, 2,494 vessels.

GOVERNMENT, ETC. The administration of the Dutch East Indies is in the hands of a Governor-General appointed by the Crown, assisted by a council of five members. The colony is divided into Residencies, of which

some are under the direct supervision of Dutch Residents, while others are under native rulers advised by Dutch officials. The Residents exercise almost absolute control through native officials. Java and Madura are directly administered by Residents, while the other islands, or "Outposts," are under Residents, Assistant-Residents, Governors, Controllers, etc. The general budget for 1908 estimated the revenue at 175,142,396 florins and the expenditure at 181,746,012. The army consisted in 1908 of 1,265 officers and 33,632 men, including 10,732 Europeans, besides an effective reserve of 5,331 (2,204 Europeans). The navy consisted in 1908 of 18 ships aggregating 28,243 tons, with crews numbering about 2,574. In 1908 the Governor-General was J. B. van Heutsz. A revolt broke out in the Island of Bali early in the year, but the Dutch troops sent to put it down captured the residence of the chiefs at Gelgal, inflicting a loss estimated at 100.

DUTCH GUIANA, OR SURINAM. A colony of the Netherlands on the northeast coast of South America. Area, about 49,845 square miles. Population (1906), 81,273, excluding some 12,000 Indians and Bush negroes. Paramaribo, the capital, had 34,870 inhabitants in 1906. In 1905 there were 56 elementary schools, with 7,489 pupils. The principal products in 1906 were: Sugar, 12,635,460 kilograms; rum, 784,217 litres; cacao, 1,480,568 kilograms; balata, 267 tons; gold, 1,178 kilograms. The estimate for the sugar output of 1908-9 was 12,000 tons. Other products are rice, maize, bananas, coffee, and molasses. In 1906 imports amounted to 6,273,000 florins (1 florin=40.2 cents), and exports, 4,749,000 florins. The revenue and expenditure for 1908 were estimated at 3,547,115 and 4,402,342 guilders, respectively, and the subvention from the mother country at 849,927 guilders. The Governor in 1908 was Dr. B. Fock.

DUTCH WEST INDIES. See CURACAO and DUTCH GUIANA.

DYAS, ADA. An Irish actress, long popular in London and on the American stage, died at Seaton, England, on March 12, 1908. She was the daughter of Edward Dyas (1815-77), and Ann Ada Dyas (1823-66), both well known to English theatre goers, and made her London debut in 1861 as Prince John of Lancaster in *Henry IV*. She created the part of Phoebe in Roberts's version of *Lady Audley's Secret*, and that of Clara in *Hunted Down*, which was first presented in London in 1866. Wilkie Collins selected her for the double rôle of Anne and Laura in *The Woman in White*, when that play was first presented (1870), and she also originated the part of Beatrice in Merivale's *A Son of the Soil*. Under the management of Augustin Daly, she made her first American appearance in 1872, at the Fifth Avenue Theatre, New York City, as Anne Sylvester in *Man and Wife*, and at Wallack's, in New York, she was very successful for three seasons (1874-76) in such rôles as Kate Hardcastle, Lady Teazle, Lady Gay Spanker, Lydia Languish, and especially in her interpretation of the impulsive and affectionate Claire Ffolliott in Boucicault's *The Shaughraun*. On the road in the United States she played Esther Eckles, in *Caste*. Subsequently at the Madison Square Theatre, in New

York City, she gave a very convincing impersonation of Mrs. Dick in *Young Mrs. Winthrop*, and thereafter she made an extended tour playing Mrs. Ralston in *Jim the Penman* and Mrs. Seabrooke in *Captain Swift*. Sir Henry Irving engaged her to play Goneril in his revival of *King Lear* at the London Lyceum in 1892.

DYER, LOUIS. An American classical scholar and lecturer, died in London, England, on July 20, 1908. He was born in Chicago, Ill., on September 30, 1851, studied in Switzerland and France, and graduated at Harvard in 1874, and in 1878, at Balliol College, Oxford, where he won the Taylorian scholarship. He was assistant professor of Greek at Harvard in 1881-87, and delivered the Lowell Institute lectures in 1889 on "The Gods in Greece," having meanwhile travelled in Greece, and in the Greek islands, with Malcolm Macmillan. In 1889 he became a lecturer on modern languages at Balliol, where his unusual ability was fully recognized, while his fine personal qualities won for him many warm friendships. He was acting professor of Greek at Cornell University in 1895-96, lectured before the Royal Institution in 1890, and in 1899-1900 delivered at American universities a series of lectures on the discoveries of Arthur Evans in Crete, which resulted in the material enlargement of the fund for further explorations in that field. He also served on the council of the Hellenic Society, and of the Egyptian Exploration Fund, for several years. His publications include, *The Greek Question and Answer* (1884); *Plato's Apology and Crito* (1886); *Studies of the Gods in Greece at Certain Sanctuaries Recently Excavated* (1891); *Schiller's der Neffe als Onkel* (1895); *Oxford as It Is* (1902); and *Machiavelli and the Modern State* (1904).

DYNAMO ELECTRIC MACHINERY. The development of this branch of electrical engineering during 1908 was confined almost entirely to alternating current apparatus. A new type of rotary converter for use in connection with storage battery installations, and a new type of single phase commutator motor for railway work, were put on the market. This new rotary converter was designed so as to give a variable direct current pressure at the commutator for a constant value of the alternating current pressure on the slip rings, which effect was obtained by alternating the distribution of flux over the pole area. The new type of single phase commutator motor, called by its promoters the series repulsion type, could be adjusted to eliminate entirely the sparking at the commutator throughout a considerable range of speed without the use of preventive leads in the commutator connections. The older compensated type of single phase commutator motor with preventive leads had, however, proved entirely satisfactory in service for the previous two years. For the construction of the iron cores of transformers a new steel alloy came into extensive use in 1908. This alloy was ordinary iron with about 3 per cent. of silicon added; the effect of the silicon was to reduce the hysteresis and eddy current losses in the core to about half the value for the best grade of steel previously used for this purpose, and also to prevent the aging of the iron due to exposure to high temperature. The permeability, however, is slightly lower than that of the older material for high flux densities, but

is considerably higher for low flux densities. The use of this steel for transformer construction has resulted in a considerable reduction in the weight and therefore the cost of a transformer of a given rating, even though the cost of the silicon steel is somewhat greater than that of the older material.

The advantages to be derived from the use of the steam turbine for driving a direct current generator were considered still questionable, although a number of these machines were in use. Considerable attention was paid during the year to the possible economy of using low pressure steam turbines in connection with large reciprocating engines for central station work. The combination is less efficient than the steam turbines alone, but there is undoubtedly a field for the low pressure steam turbine in large central stations already equipped with reciprocating engines.

DYSENTERY. See TROPICAL MEDICINE.

EARTHQUAKES. There was no abatement of seismic activity, at least in its destructive manifestations, during 1908. The record of the two preceding years, with the enormous losses inflicted by the San Francisco (1906), Valparaiso (1906), and Kingston (1907) earthquakes,—to mention only the more important ones,—was overshadowed by the disaster that befell Messina and Reggio on December 28, 1908. It is no exaggeration to say that this was the worst earthquake calamity ever visited upon a civilized country. In the extent and completeness of the devastation which it left in its wake, it surpassed any previous cataclysm on record, with the possible exception of one or two Asiatic earthquakes of which little has been made known to us. The Lisbon earthquake of 1755 killed 60,000 people, buried in the ruins of the city or drowned by the great sea waves that invaded the harbor. In 1783 Calabria was shaken by an earthquake, quite similar in some respects to the recent one, which left 30,000 dead and an equal number to perish by injury, famine, and disease. Were the loss of life in these disasters combined, it would scarcely equal, crediting the more conservative estimates, the number involved in the 1908 catastrophe.

The shock wrought its maximum effects within the narrow coastal strip bordering the Straits of Messina and the adjacent waters. The zone of devastation extended outward from this centre over an area of about 4,500 square miles, including the southern part of Calabria on the Italian mainland and the provinces of Messina and Catania, Sicily. The tremors were felt with decreasing violence as far north as Naples. The principal centres of population within the epicentral area were Messina on the northeast corner of Sicily and Reggio lying a little farther south and across the straits in Calabria. Smaller cities, villages, and hamlets existed all along the neighboring coasts, with many likewise in the interior. Messina, numbering 160,000 inhabitants, and Reggio, with about 60,000 (commune), were completely demolished, and it was believed that fully 100,000 people were overwhelmed in the ruins of the fallen buildings or perished in the fire and flood that ensued. Over 40 communities in Calabria and Sicily were desolated; among the number were Palmi, Bagnara, Monteleone, Pizzo, Seminara, San Procopio, Casano, Santa Eufemia, and Stefaniconi. The whole number

of dead can only be approximated, though the estimates by government officials placed it around 125,000. Other observers estimated it as high as 200,000. Confusion and panic reigned everywhere, and it was impossible to take count of the survivors whose only thought apparently concerned their individual safety. The populace, half-clad and mad with fear, streamed into the open country, leaving behind the imprisoned and injured, bent only on quitting the scene of disaster as rapidly as possible. The few that remained were afterward removed under government supervision in order better to provide for their support.

Immediately after the earthquake, fires broke out in many places, consuming the wreckage and many of the imprisoned, living and dead. At Messina the water and gas mains were disrupted, the latter giving rise to frequent explosions. The conflagration lasted there four days before it was got under control. The devastation left few vestiges of that once thriving city, next to Palermo, the largest and most important in Sicily. The houses were wrenched from their foundations, and all the large buildings, including the cathedral which had withstood the repeated shakings of past centuries, were laid to the ground. A single house was said to have been left in habitable condition. In Reggio the effects of the earthquake and fire were not less appalling; the loss of life there was reported to have been relatively greater even than at Messina. Following close upon the main shock all the low-lying section of the coast was invaded by immense waves that were set in motion by the sudden displacement of the sea bottom. The waters advanced in a massive wall 30 feet high and broke upon the land with tremendous force, submerging the harbor of Messina, where many survivors of the earthquake had taken refuge, and laying waste a large area. The quays were partially engulfed, and the whole sea front of Reggio was swept away. Ships at anchor in the harbor were severely shaken, but received little injury.

The financial loss involved in the disaster can hardly be estimated. Besides the public and private property destroyed, which was figured roundly at \$1,000,000,000 soon after the catastrophe, account must be taken of the indirect, though enormous, loss incurred by the extinction or derangement of local industries and the diversion of trade and commerce, which can only be repaired after many years; as well as of the thousands of injured and the still greater numbers of those who, deprived of their homes and means of support, must become a heavy burden upon the rest of the country. Messina was one of the most important commercial cities in the Mediterranean. It was the shipping centre for a large section of Sicily, besides serving as a main station on the trade route through the Suez Canal. The famous harbor, curved in the shape of a sickle, was strongly fortified. Reggio, lying on the principal railroad line traversing southern Italy, was the point of departure for boats to Messina and also carried on considerable commerce.

The main earthquake occurred at about 5.20 o'clock on Monday morning, December 28. It lasted only half a minute. According to witnesses it seemed in effect as if the ground sank under them and then rose again, after which there was a violent rocking motion. A heavy rumbling like thunder accompanied the shock

and torrents of rain fell in places. Smaller tremors were felt in the evening of the same day and for several days afterward, but the first did the damage. The shock may be considered the climax of a long period of disturbance, traceable by a series of smaller movements to the severe earthquakes of October, 1907, and September, 1905.

Notwithstanding the fearful havoc which it entailed, the shock does not appear to have been of excessive violence when compared with some of the earthquakes that have occurred elsewhere in recent years. In fact the records of foreign seismograph stations, at least those in this country, would indicate, if anything, that it was no more forceful than the San Francisco disturbance and perhaps less so than the Valparaiso shock. The unparalleled loss of life is to be ascribed rather to external conditions attending its occurrence. The main shock, as has been stated, came early in the morning when the inhabitants, being in their homes and asleep, were caught in the wreck of the falling timbers and masonry before they could escape to the streets. The buildings were mostly stone and stucco structures, few or none of which had been designed to withstand a heavy shaking, though the region has always been subject to frequent disturbance. In the San Francisco catastrophe, there was much less damage to the frame or steel structures, and the loss of life from that cause amounted to only a few hundreds. The same was true of the extraordinary Charleston earthquake. The floods and fires consummated the desolation at Messina, which was, however, chiefly the result of the first and principal convulsion.

Any full description and analysis of the physical features of the disturbance must await detailed official and scientific investigation, which will, no doubt, be undertaken in due time under government auspices. From early and available information there was reason to believe that the earthquake originated from a displacement of the strata very similar to the fault movement at San Francisco, except in this case the displacement occurred under the sea. The coastal region suffered most damage from the shock, while the waters were set in a violent commotion which could only arise from a sudden submarine dislocation, without much doubt along the depression occupied by the Straits of Messina. This depression—24 miles long and from 2 to 12 miles wide—has been generally considered to represent the result of faulting that took place principally in prehistoric, though geologically recent, times, before which Sicily was directly connected to the mainland. Thus, the latest disturbance may have been only a continuation or re-starting of a fault movement long since initiated. The reported modifications of the coast line and the changes in depth of the sea where tested by soundings tended to confirm this view. Any direct relation between the earthquake and volcanic activity in the vicinity was not apparent, though that possibility found some advocates. Both Etna and Stromboli seemed to have given little or no sympathetic response to the convulsion, notwithstanding both lie well within the region affected.

The scenes of horror and suffering incident to such a disaster were heightened in this instance by delay, unavoidable to a great extent,

in organizing the populace and bringing an effective service into existence. The inhabitants who escaped were too terrorized to give aid to the less fortunate; and as the railroads, bridges, and boat landings for miles around were deranged, many hours elapsed before the arrival of assistance promptly despatched by the government at Rome. First with the coming of troops and surgeons from the outlying cities began the search of the ruins for injured. Many hundreds were recovered in the first few days. Some were taken from the ruins alive a week or more after the earthquake. Temporary hospitals were installed at Rome, Naples, and other cities to receive the injured. Sailors from the British and Russian warships in the vicinity rendered splendid service in the rescue work. The King and Queen of Italy were foremost, among those who visited the region, in organizing and directing the forces. The government, by its energetic action in removing the populace from the cities with their piles of unburied dead, prevented the possibility of the outbreak of an epidemic, and, by the maintenance of martial law, held in check the criminal element that had begun a reign of violence and pillage. Other nations contributed generously toward the relief of the destitute survivors who were threatened with the additional horror of a famine. The United States Congress voted an appropriation of \$800,000, and a ship loaded with supplies was immediately despatched to Messina. A much larger sum was contributed from the United States through the American Red Cross Society.

Most of the thousands of dead found nameless graves. Among the Americans known to have been killed were Consul Arthur S. Cheney and wife at Messina, whose bodies were afterward recovered. Fortunately, there were not many tourists in the region at the time, the winter season of travel having hardly begun.

OTHER EARTHQUAKES. On March 26, 1908, a severe earthquake was felt in the State of Guerrero, Mexico. The greatest damage was inflicted at Chilapa, a city 115 miles south of the city of Mexico. The fatalities, if any, were not reported. Central Europe, as well as Italy, was shaken in November by a series of small disturbances, some of which seem to have been the precursors of the earthquake of December 28.

SEISMOLOGY. The first general meeting of the International Seismological Association, held at the Hague in September, 1907, was attended by representatives from nearly all countries where the scientific study of earthquakes is in progress. Among the principal subjects under discussion at the meeting were the establishment of additional observing stations at critical points, the improvement of recording instruments, and the encouragement of special investigations of seismic phenomena by financial grants from the association's funds. The Central Bureau of the association completed the task of collecting and publishing the record sheets for the Valparaiso earthquake of August 16, 1906. The volume, with its facsimile copies of the seismograms obtained at 78 different stations situated in nearly all parts of the world, should prove invaluable for the study of earth tremors and their propagation. An important paper on the theory of the origin of earthquakes was contributed by G. Agamennone of the Geodynamic Observatory, Rome, Italy.

**CATHEDRAL AT MESSINA AND THE FOUNTAIN OF THE
PIAZZA DEL DUOMO AFTER THE EARTHQUAKE**

THE GREAT EARTHQUAKE OF 1908 AT MESSINA

Two types of earthquakes are recognized, volcanic and tectonic. The former are connected with volcanic activity and may be traced to subterranean explosions during or preceding an eruption. They are rarely destructive and then only within a limited area. The tectonic earthquakes are caused by a slipping of a larger or smaller portion of the earth's crust along a fracture, usually extending downward in a nearly vertical direction. There are various explanations to account for such movements, but Agamennone would give prominence to the action of underground waters in undermining the surface rocks which then undergo displacement owing to the action of gravity. All rocks are attacked by the solvent power of such waters, and limestones to a marked degree, and in the course of time cavities might be formed, leaving the overlying rocks unsupported. With strata yielding suddenly to the strain, a subsidence of only a few inches would involve enough energy to give rise to earth tremors.

ECONOMIC ASSOCIATION, AMERICAN
A learned society, organized in 1885 for the encouragement of economic studies and the publication of papers thereon. The 21st annual meeting of the Association was held at Atlantic City, December 28-31. Three smaller bodies, the American Sociological Society, the American Statistical Society, and the American Association for Labor Legislation convened at the same time and place. These associations devoted several joint sessions to subjects of common interest. The Economic Association and the Sociological Society discussed jointly the subject of Modern Industry and Family Life, while the Economic Association and the Association for Labor Legislation discussed together Employers' Liability, Industrial Insurance, and Public Boards of Arbitration. The annual address of the retiring president of the Economic Association, Professor Simon M. Patten of the University of Pennsylvania, was devoted to "The Making of Economic Literature." Perhaps the most important paper of pure economic value was that read by Professor J. B. Clark of Columbia on "Collective Bargaining." Professor G. E. Barnett of Johns Hopkins also contributed to the discussion of this subject. Among other important questions discussed in the general sessions were, tariff revision, the establishment in the United States of a Central Bank, and the public regulation of security issues by corporations. An important and interesting paper on the tariff was read by Professor H. C. Emery of Yale University. He maintained that historically the crusade against protection had been a failure so far as it had been founded on the consumers' interest. Free trade, he contended, had prevailed only when urged by the selfish interest of special groups of producers. The two leading papers on the establishment of a Central Bank were read by Paul M. Warburg of Kuhn, Loeb & Co. of New York City and by Horace White of New York City. In general, they both supported the project. In the concluding session an able paper was read by Professor C. J. Bullock of Harvard, who urged that legal restrictions imposed in

Massachusetts on the issue of securities by transportation companies had driven capital from the State and arrested the growth of needed railway facilities in New England generally. Milo R. Maltbie, of the Public Service Commission of New York of the First District, defended the public regulation of security issues by railway companies. The New Jersey law was outlined by Mr. Justice Swazey of the New York Supreme Court. In a joint session with the Sociological Society, the chief discussion related to the recent social census of Pittsburg. At the next annual meeting of the Association, to be held in New York City, the quarter centennial anniversary of its founding at Saratoga in 1885 will be celebrated. Professor Davis R. Dewey of the Massachusetts Institute of Technology was elected President and Professor T. M. Carver of Harvard University Secretary and Treasurer.

ECONOMIC ENTOMOLOGY. See **ENTOMOLOGY.**

ECUADOR. A republic of South America. Area (including the Galapagos Islands), 118,627 square miles; population, 1,272,000, mostly Indians, who are virtually slaves. The principal cities, with their populations, are: Quito, the capital, 50,841 (1906); Guayaquil, 51,000; Cuenca, 30,000; Riobama, 18,000; Ambato, 10,000; Ibarra, 10,000; Loja, 10,000; Puer-toviejo, 10,000.

EDUCATION. There are about 1,100 free elementary schools, normal, commercial, and technical schools. Since 1900 English has been taught in the normal schools by American teachers. The educational institutions of Quito in 1908 comprised the national university, 5 colleges (one military college), 2 normal institutes (one for girls), a medical school, 2 seminaries, a theological school, an institute of science, a school of arts and trades, 3 schools for young ladies, a conservatory of music, and 3 kindergartens.

PRODUCTION. Gold is mined at Zaruma, in the province of Oro, by an American company. Silver, platinum, copper, lead, iron, coal, and sulphur are also found. Salt production is a government monopoly. The leading agricultural product is cacao, of which Ecuador furnishes about one-fifth of the world's production; in 1906 the output was 57,770 Spanish quintals (of 101 pounds). The 1907 cacao crop was one of the shortest in recent years, while the 1908 crop is reported to be one of the best. The coffee crop of 1907 was one-half less than in 1906. There are some 5,000 cacao plantations, with 61,000,000 trees. The production of sugar in 1907 was 7,350 long tons; of rubber, in 1906, 620 tons, and in 1907, about one-eighth less. The annual yield of tobacco is between 3,000,000 and 4,000,000 pounds. The export of coffee from Guayaquil in 1906 was 5,770,000 pounds. The leading manufacturing industry is the making of Panama hats. At Quito there were in 1908 several establishments for the manufacture of cotton and woolen blankets, common carpets, hats, wagons and saddlery, brick and tiles, candles, cheese, chocolate, 7 flour mills, a foundry, an ice factory, 2 sugar refineries, etc. Religious paintings and statuary are largely exported. Guayaquil contains establishments for the making of cotton fabrics, mosaics, matches, soap, candles, ice, beer, biscuits, chocolate, and a well-equipped tannery.

FOREIGN COMMERCE. In 1907 the imports amounted to \$9,849,987, a gain of \$1,344,187 over 1906, and the exports, \$11,793,213, a gain of \$102,970. The principal imports in 1907 were: Textiles, other than silk, \$2,622,885; food products, \$1,535,907; iron and hardware, \$640,886; wines and liquors, \$444,063; coal, \$413,284; machinery, \$363,634; clothing, \$327,583; shoes and findings, \$1,666,387; drugs, \$292,147; gold and silver coin, \$1,084,444. The principal exports in 1907 were: Cacao (43,348.369 pounds), \$6,934,257; ivory nuts (47,131,627 pounds), \$1,358,056; hats, \$1,171,043; toquilla straw used in making Panama hats, \$90,523; rubber (1,031,510 pounds), \$777,544; hides, \$351,344; gold bullion, \$142,750; gold and silver precipitates, \$137,175. The trade with the principal countries of origin and destination in 1907 was as follows:

From and to	Imports	Exports
United States	\$2,349,182	\$3,347,185
France	598,300	4,046,380
Germany	1,800,390	1,483,607
Great Britain	3,540,996	1,165,000

COMMUNICATIONS. The port of Guayaquil was entered in 1907 by 210 vessels (1 American), of 422,344 tons. The Transandean Railway from Quito to Guayaquil, 286 miles long, was completed on June 19, 1908. Work on the Huigra-Cuenca railway, about 92 miles long, was begun in 1908. The total railway mileage in 1908 was 325 miles; of telegraph lines, 2,570.

FINANCE, ETC. The total revenues in 1907 amounted to 12,724,567 sucres (1 sucre=48.7 cents), and the total expenditure, 15,401,785 sucres. The deficit was due to railway construction, and was met by a loan of 2,892,811 sucres. The external debt stood in December, 1907, at 10,808,000 sucres; the internal debt, on December 31, 1906, at 7,784,311. On November 1, 1908, the President was authorized to negotiate a loan of 10,000,000 sucres for the payment of the internal debt, in order to release the federal revenues pledged to its payment. Military service is obligatory between the ages of eighteen and forty-five years, of which fourteen are spent in the regular army and thirteen in the national guard. The army in 1908 numbered 4,379 officers and men organized into 3 brigades of artillery, 9 battalions of infantry, and a regiment of cavalry. The national guard numbers about 90,000 men. The navy consists of 2 gunboats, of 1,782 tons. The President in 1908 was Gen. Eloy Alfaro, whose term is 1906-10.

HISTORY. Under the decree issued by President Alfaro in October, 1907, for a national exposition to be held at Quito, August 10, 1909, on the one hundredth anniversary of the struggle for independence in South America, arrangements were made for the participation of other nations. On April 12, 1908, the president read his message before Congress. It contained the usual review of conditions during the year, and congratulations on the relations with foreign powers. It was announced that a treaty settling the boundary dispute with Colombia (q. v.) would be submitted to Congress by the Minister of Foreign Relations. The public

school system was reported to have greatly improved, but additional facilities for technical education, including the establishment of scientific and industrial schools and an agricultural college, were recommended. Liberal immigration rules were also urged upon Congress in order to secure an adequate supply of labor and promote economic development. On August 29 a commercial and navigation treaty with Chile (q. v.) was signed, providing, among other things, that the same treatment shall be accorded to the vessels of one nation in the ports of the other as is given to each nation's own vessels, and that arrangements shall be made by both governments for subsidies of lines between the two countries. A sanitary convention was concluded with Panama September 26, 1908.

EDEBOHLS, GEORGE MICHAEL. An American physician, died on August 8, 1908. He was born in New York City on May 8, 1853, graduated at St. John's College, Fordham, A. B., 1871, and A. M. 1886 (LL. D., 1903), and in 1875 M. D. at the College of Physicians and Surgeons, Columbia University. He was house physician and surgeon of St. Francis Hospital, New York, in 1875-79; gynecologist at that institution in 1887-1903, and consulting surgeon there after 1903. After 1893 he was professor of the diseases of women at the New York Post Graduate Medical School and Hospital, and he was also consulting gynecologist at St. John's Hospital and at the Nyack Hospital. Dr. Edebohls made a specialty of abdominal surgery, and shortly before his death had performed the operation of decapsulation of the kidney for the relief of nephritis. He had published *The Surgical Treatment of Bright's Disease* (1904).

EDUCATIONAL ASSOCIATION, NATIONAL. See EDUCATION IN THE UNITED STATES.

EDUCATION IN THE UNITED STATES.

The report of the Commissioner of Education for 1907 indicates that in 1906-07 approximately 19,000,000 pupils were enrolled in educational institutions in the United States. For thirty years about 20 per cent. of the population has been so enrolled, but during that period the average school year has lengthened from 130 to 150 days and the average attendance of those enrolled has increased from 62 to 70 per cent. The attendance on higher institutions continued to increase until one person out of every ninety was enrolled in a high school and one of every three hundred in a college or similar institution. Of the 475,000 teachers in the public schools only 22 per cent. were men, their number having decreased for ten years. The salaries of teachers have risen during that time but not so rapidly as the expenditure for equipment. In 1906-07 salaries represented three-fifths of the \$330,000,000 expended for public schools, equipment one-fifth, other purposes one-fifth. The average teacher's salary was about \$57 a month for men and \$44 a month for women. The expenditure in that year for all forms of education was approximately \$442,000,000 and the investment equipment almost one billion dollars. New York City spent \$33,000,000 on its public schools, Chicago \$22,000,000 and Boston, \$10,000,000.

The Sixtieth Congress restricted the Bureau of Education to an appropriation of \$87,500, an increase of \$250 for books, and \$1000 to raise the salary of the Commissioner of Education to \$4,500. No appropriation was made for the investigation of agricultural and industrial education and similar topics, for which the National Education Association, the Commissioner of Education, and the Secretary of the Interior urged a grant of \$40,000. The State of New York, on the other hand, has approved plans for the erection of a \$3,000,000 State Education Building. In February the Commissioner of Education held in Washington a conference of the chief educational officers of the States and Territories.

The National Educational Association in its forty-sixth convention at Cleveland, Ohio, from June 29 to July 3, organized new departments of rural and agricultural education and of national organizations of women. Its annual declaration recommended: (1) the establishment of municipal trade, industrial and evening continuation schools for the preparation of advanced apprentices and journeymen; (2) the subordination of diversity in studies to thoroughness in essentials; (3) the careful consideration of the individuality of pupils; (4) the adaptation of public high schools to industrial as well as educational ends; (5) training in morals and in business and professional ethics; (6) the development of the Bureau of Education at Washington into an independent department of the government with resources for conducting and publishing investigations; (7) special preparation and higher salaries for teachers; (8) the revision of child-labor laws so as to favor education; (9) the use of school buildings for vacation and evening schools and for lecture courses for adults, and the summer use of school grounds, gymnasiums and baths by children in crowded districts; (10) local taxation, merely supplemented by State aid, for the support of public schools; (11) the replacing of large school committees or boards by small boards and expert salaried executives; (12) skilled supervision for all grades of schools; (13) the establishment of rural high schools and the consolidation of rural district schools; (14) the building of character as the real aim of the schools; (15) the reading and study of the English Bible as a literary work; (16) the removal of professionalism and other abuses from student sports; (17) attractive school buildings and beautiful school grounds as agencies for educating public taste; (18) the highest ethical standards among teachers, and (19) professional fitness—preparatory training, experience, and meritorious service—as the sole basis for the appointment and promotion of teachers.

Conspicuous attention was directed during 1908 to the physical welfare of school children. Athletict, gymnastics, games, and dances were elaborated and organized. The Playground Association of America recommended State legislation and city and institutional provision for playgrounds; emphasized the importance of athletic games and folk dancing; elaborated model playground equipment and procedure; and began a library and museum of material bearing on the movement. Various cities continued their supervision of play and their domestic and industrial instruction during

the summer. Several cities founded summer camps. Similar to this development in physical education there was a broadening from mere class instruction in physiology and hygiene toward their full application in school buildings, curricula, and general procedure, thus putting into practice the teachings of the American School-Hygiene Association, organized in May, 1907, and of the second International Congress of School Hygiene, which met in London in August of that year. School physicians and nurses have made inspections for the detection of contagious and non-contagious disease, teachers have been trained to make tests of vision and hearing, and physical defects have been studied in their relation to mental retardation. The necessity for dental, medical, or surgical attention was made clear to Boards of Health and indicated to parents. Poorly printed textbooks and badly lighted school-rooms were looked to; and too great concentration in school and too much home-study became subjects of inquiry. The matter of proper nourishment for school children also received attention, especially in New York, where, in June, after agitation by social workers, the Board of Education found upon investigation about 1 per cent. of the school population underfed. This small proportion was accepted as in part a tribute to school instruction in domestic science. To further the general interests of this latter field of instruction, the Lake Placid Conference on Home Economics, which was organized ten years ago, was elaborated, at a convention in Washington in December, into the American Association of Home Economics.

Manual training appeared during the year chiefly in its elaborated form of industrial education. Institutions developed for this purpose prospered, and others were established and endowed. The first annual convention of the National Society for the Promotion of Industrial Education met in Chicago in January, stating the realization by manufacturers that commercial supremacy depends upon better technical training, the desire of educators for less bookish schools, and the demand of workers for a training suited to their needs; and stating its intention to study conditions, to recommend types of trade schools, and to articulate these with existing systems of public education. Later many state branches of the society were formed. Chicago inaugurated evening continuation schools for working boys and girls. The Massachusetts Commission on Industrial Education found many of its new evening industrial schools already taxed. The Conference for Education in the South adopted resolutions in favor of industrial and agricultural education in elementary and secondary schools. Nature-study continued a centre of interest. There was special effort in rural districts to develop nature-study into elementary agriculture, and agricultural high schools were established in each of the Southern states. The New York Nautical School acquired a larger school ship, but it is still the only public institution of its kind. The most conspicuous development in commercial education was the erection by Chicago of a 14-story public school building especially for day and evening business training. Instruction in citizenship was inaugurated in various schools by the establishment of pupil government after the fashion of the George Junior Republic (q. v.), which was

also duplicated in several regions during the year. School work in fine arts was encouraged by the enthusiastic reception of exhibits from sixty American cities of the Third International Congress of Art Education in London in August. American delegates at the conference emphasized the importance of such work for the development of public taste and artistic improvement of industrial products. American delegates also shared in the International Congress of Household Economy and Arts in Switzerland in September and in an interchange of language teachers with Prussia. Some 500 American teachers visited England during 1908, under the auspices of Mr. Alfred Mosely.

There was also in 1908 conspicuous discussion as to the educational importance of the theatre. The Children's Theatre of the Educational Alliance of New York, which, during five years, had entertained nearly 200,000 children, became incorporated independently, and announced courses for teachers in educational theatre methods. Similar organizations were begun in Boston, Cincinnati, and Los Angeles. Interesting pageants of education were given at the dedication of the new buildings of the Boston Normal School, and at the 23rd anniversary of the Brooklyn Training School for Teachers.

In special fields of education there seemed to be a growing tendency among public school systems to care for deaf, dumb, and crippled pupils hitherto entrusted to charity. The State of New York passed a law providing a reader for every blind student who is ready to enter college. Interest in the welfare of dull, backward, and feeble-minded children continued to increase; and the National Association for the Study and Education of Exceptional Children inaugurated a summer session for teachers of atypical children. Evening schools, lectures, and clubs for adults continued to develop, especially among recent immigrants for whom numerous special schools were opened. The several Indian schools away from reservations were continued, although a preference for reservation schools appeared to be growing in Congress. Public attention was drawn to the field of negro education by a negro girl's winning the inter-city spelling match held at Cleveland during the meeting of the National Educational Association. At the annual Conference for Education in the South at Memphis, Tenn., in April, encouraging progress was noted, the need for high schools and for compulsory education was emphasized, and Ambassador Bryce spoke in favor of higher as well as industrial education for the negro. The work and needs of Hampton and Tuskegee and similar less prominent institutes occupied their usual share of public attention, and funds were given to Berea College for the erection of the separate school for negroes required of it by the Kentucky legislature. On the invitation of the Southern Education Board, the Association of Southern State Superintendents of Education visited schools in New York and Boston in October.

In the field of sectarian education the Roman Catholic church emphasized its preference for that form of training by the erection and enlargement, through the efforts of orders, churches, and individuals, of all grades of parochial schools, until they enrolled, for example, one-seventh of the school pupils in New York. The fifth general convention of the Religious

Education Association meeting in Washington in February declared the need of a stronger public school conscience, as well as for more educational Sunday School instruction. The International Moral Education Congress meeting in London in September hoped for a greater ethical penetration of the whole curriculum, and various local organizations undertook to further these various ends.

The most widely discussed criticism of the year was based upon a report from West Point that of its candidates from every State and Territory, 84 per cent. failed in one or more subjects, 66 per cent. failed in two or more, 30 per cent. were physically unfit, and 8 per cent. failed in everything. Ninety per cent. of the candidates came from the public schools, where they had averaged an attendance of 9 years and 11 months. Of the failures geometry claimed 67 per cent., algebra 44, composition and literature 40, grammar 37, geography 21, history 15. Many comments traced the faults of the schools to the payment to teachers of salaries paralleling the wages of untrained laborers or of domestic servants. The scarcity of elementary school teachers in larger cities became pressing. Advocates of equal pay for men and women teachers failed to pass in the New York legislature, a measure similar to one vetoed by the Governor in 1907. New York City however raised its minimum salary from \$660 to \$720 at an annual cost of \$3,000,000, and Chicago increased its minimum from \$530 to \$630. An agitation for teachers' annuities was begun by the Association of Collegiate Alumnae. The financial support of public schools continued everywhere to increase, except that in some Southern localities the spread of prohibition carried with it the loss of school funds hitherto drawn from excise, and that several Eastern railroads withdrew their reduced rate students' tickets.

EDUCATIONAL LITERATURE. The following books were significant among the educational publications of 1908:

School Reports and School Efficiency by David S. Snedden and William H. Allen; *Medical Inspection of Schools* by Luther Halsey Gulick and Leonard P. Ayres; *American Playgrounds* by Everett B. Mero; *California Prize Essays on Moral Training in the Public Schools*; *Education and Industrial Evolution* by Frank T. Carlton; *Industrial Education* by Harlow S. Person; *Beginnings in Industrial Education* by Paul H. Hanus; *Principles of Secondary Education* by Charles De Garmo; *The Kindergarten in American Education* by Nina C. Vandewalker; *Personality in Education* by James P. Conover; *The Life and Work of Christopher Dock* by Marten G. Brumbaugh; and *Sheldon Jackson* by R. S. Stewart.

EGYPT. A country of northeast Africa, nominally dependent upon Turkey, but occupied by Great Britain. Its total area, excluding the Sudan (q. v.), is about 400,000 square miles, but its cultivated area covers only 12,976 square miles. Population, in 1907, 11,272,000, against 9,821,045 in 1897. The principal cities are Cairo, the capital, 640,000 (1907); Alexandria, 376,833 (1907); Tintah, 57,289 (1897); Port Said, 42,095 (1897).

EDUCATION. In 1907 there were under government inspection 4181 native rudimentary schools (*kuttabs*), with 164,506 pupils (11,745

girls), 2,761 schools receiving government aid to the amount of ££17,402 (££1 equals \$4.943). Exclusive of *kuttabhs* there were, in 1906-7, 505 schools established by foreign missions and native societies, with 92,107 pupils (70,455 Egyptian). The schools under the immediate direction of the government in 1907 included 143 *kuttabhs*, with 7,895 male and 2,666 female pupils; 34 primary schools, with 8,155 male and 401 female pupils; 4 secondary schools, with 1,909 pupils; 12 special and technical schools, with 2,110 pupils (47 female); and 11 colleges of medicine, law, engineering, teachers' training, military, veterinary, and Mohammedan law, with 1,475 students (44 female). In the budget of 1908 the expenditure of the Ministry of Education was estimated at ££450,450. There are two great Mohammedan theological schools—one at Cairo, with 10,000, and another at Tanta, with 5,000 students. In October, 1908, there was to be opened the first Egyptian university on the European model. The site was provided by native landowners, and \$50,000 were collected for the purpose. At first the lectures were to be on French, English, and Arabic literature, as well as on Mohammedan and general history. Teachers were to be gained from France, England, Germany, and Switzerland, and students were to be sent to Paris, Oxford, Cambridge, and Leeds, to act later as professors.

PRODUCTION. The Sinai peninsula furnishes most of the turquoises in the world. Marble, red granite, Oriental alabaster, and limestone are found. The output of salt in 1906 was 110,000 tons. Companies have been organized to exploit the ancient mining regions, and about 1,500 workpeople are employed. Considerable gold, copper, phosphates, and nitrates have been found, and there are indications of coal and oil. A report on the topography and geology of the western portion of the Sinai peninsula was recently published by the Egyptian Survey Department. The principal minerals found are gray granite, pure white sandstone very useful in glass manufacturing, iron and manganese ores.

About 61 per cent. of the population are engaged in agriculture. The state is theoretically the ultimate owner of the land, and the land tax, or rent, varies between \$1.75 to \$5.50 per feddan (1 feddan equals 1.03 acre). In 1907 there were under cultivation 6,426,000 feddans. The distribution of the land in 1907 is shown in the following table:

Extent of holdings in feddans	Landowners		Area	
	Number	Per-centage	Feddans	Per-centage
0-5	1,084,001	88.09	1,292,786	23.80
5-10	76,935	6.25	538,111	9.91
10-20	36,951	3.00	512,199	9.43
20-30	11,347	0.92	177,297	5.11
30-50	8,682	0.71	334,372	6.16
Over 50	12,665	1.03	2,476,007	45.59
Totals	1,230,581	100.00	5,430,772	100.00

Of the total number of landowners, 6,021 were foreigners, owning 665,226 feddans. In 1906-7 the area under wheat was 1,218,346 feddans; maize, 1,299,282 (1,261,186 in 1907-8); cotton, 1,663,224 (1,638,040 in 1907-8); sugar-cane, 41,008. The production of wheat in 1907 was 12,000,000 bushels; maize, 30,000,000 bushels; rice (average), 20,000,000 pounds; cotton, 716,588,591 pounds. Owing to unfavorable weather,

the cotton crop of 1908 was estimated in November at between 625,000,000 and 650,000,000 pounds. The Egyptian Cotton Commission, in its report published in the spring of 1908, arrived at the conclusion that the yield of cotton has been relatively diminishing in quantity and deteriorating in quality. The quantitative decrease since 1896 is shown in the following, by three-year periods:

Years	Average yearly area planted	Average yearly yield	Average yearly yield per acre
	<i>Feddans.</i>	<i>Pounds.</i>	<i>Pounds.</i>
1896-1898	1,083,998	583,703,515	538
1899-1901	1,206,778	578,885,336	481
1902-1904	1,324,605	617,988,105	458
1906-1907	1,551,396	634,660,951	410

According to the Commission, the principal causes of this condition are the enfeeblement of the land, rotatory irrigation, insect pests, and lack of fertilizers. The enfeeblement of the soil is largely due to biennial cropping and lack of fertilizers; a return to triennial cropping and more fertilization are recommended. As to irrigation, it is recognized that the system of rotation has been beneficial, but to insure good results the period should never exceed 18 days, or 14 days if water be obtainable. Insect pests, recognized as one of the principal causes, are favored by biennial cropping. The Commission also recommends that the cultivation of rice on high-lying lands be permitted in certain provinces.

The sugar-cane crop in 1906 was 700,000 tons; in 1907, 500,000; in 1908, 400,000. The sugar trade is principally in the hands of a French company, besides two or three small private refineries. The output of the company in the years ending October 31 was: in 1905-6, 63,634 tons of raw and 46,619 tons of refined sugar, out of 684,008 tons of cane; in 1906-7, 41,509 tons of raw and 31,144 tons of refined sugar, out of 414,877 tons of cane. The local consumption in 1905-6 was 75,000 tons of refined sugar; in 1906-7, 82,378 tons. In 1908 the company announced that experiments with Java cane have been successful, this variety promising a yield of cane double that of the native variety, with an equal percentage of sugar.

In 1907 it was decided to raise the Assuan dam 23 feet higher. This work is expected to take six years and its cost is estimated at ££1,500,000. It will add 950,000 acres to the cultivatable area. The foundations of the Esneh barrage, or dam, were completed in June, 1908, and the entire structure was to be finished by the end of February, 1909—a year earlier than had been originally expected. In 1908 the Nile flood was the highest since 1898.

FOREIGN COMMERCE. The imports and exports of merchandise in 1907 amounted to ££26,120,783 and ££28,013,185 respectively, and of specie ££7,768,190 and ££4,736,189; against ££24,010,795 and ££24,877,280 respectively for merchandise, and ££9,077,402 and ££2,067,706 for specie, in 1906. The principal imports in 1907 were: Animals and animal food products, ££1,280,811; cereals and vegetables, ££2,963,981; spirits, oils, etc., ££1,151,518; wood, coal, etc., ££3,407,021; textiles, ££7,006,851; metals and metal manufactures, ££3,960,854; tobacco, the cultivation of which is prohibited, ££716,201. The

principal exports in 1907 were: Cereals and vegetables, £E3,189,500; cotton, 6,859,223 cantars (99.5 pounds each), valued at £E23,597,851; cotton seeds, £E2,555,000; cigarettes, £E393,509. The trade with the principal countries of origin and destination in 1907 was as follows:

From and to	Imports	Exports
Great Britain	£8,492,848	£15,225,116
British colonies	1,299,888	134,470
Germany	1,392,381	2,252,964
Austria-Hungary	2,059,423	1,315,397
Belgium	1,027,590	90,251
France	3,168,890	2,040,533
Italy	1,361,457	791,044
Russia	676,868	1,599,580
Turkey	2,973,108	337,410
America (mostly U. S.)	572,704	2,101,785

According to United States returns, the imports of the United States from Egypt during the year ending December 31, 1908, amounted to \$12,049,918, and the exports to Egypt, \$1,766,232. The imports and exports of Alexandria in 1907 amounted to £E23,319,366 and £E27,453,314 respectively.

COMMUNICATIONS. In 1907 there were 1,743 miles of State railways and 711 miles of private railways. The length of telegraph lines was 2,898 miles. In 1906 the port of Alexandria was entered by 2,842 ships of 5,199,864 tons, and cleared by 2758 ships of 5,194,304 tons.

BANKS. The National Bank of Egypt had on December 31, 1906, a capital of £3,000,000 (sterling), reserve funds of £1,440,000 (sterling), and a note circulation of £E2,171,000. The Agricultural Bank had on the same date a paid-up capital of £3,740,000 (sterling), and a total of 228,060 loans outstanding, amounting to £E7,879,723. This bank lends money to the fellahs at 8 per cent. The government guarantees interest on the bank's capital at 3 per cent., and through its tax-gatherers collects the money due to the bank with the land tax. The post office savings banks had on December 31, 1906, deposits of £E331,072, due to 43,877 depositors, of whom 15,207 were Europeans.

GOVERNMENT. The nominal ruler of the country is the Khedive. The present Khedive, Abbas Hilmi, succeeded to the throne on the death of his father, January 8, 1892. There is a native Ministry, composed of 7 members; a Legislative Council of 30 members, of whom 14 are appointed by the government; and a Legislative Assembly, consisting of the ministers, the members of the Legislative Council, and 46 elective members. The functions of the Legislative Council are purely consultative. The Legislative Assembly must be summoned at least once every two years; it has no general legislative power, but no new direct personal or land taxes can be imposed without its consent. The general legislative authority rests with the Khedive and his ministers, behind whom stands the real ruler of the country—the British Financial Agent and Consul-General. Lord Cromer, who held that position since 1883, resigned in 1907, and was succeeded by Sir Eldon Gorst. The consular courts try the civil and criminal cases of their subjects; mixed tribunals, composed of native and foreign judges, deal with civil suits between persons of different nationalities and between natives and foreigners, and to some extent also with criminal offenses of foreigners.

The mixed tribunals have to be renewed every five years, the present term ending in 1910.

FINANCE. The revenue and expenditure in 1907 were £E16,367,818 and £E14,280,413. The budget for 1908 estimated the revenue at £E15,030,000, and the expenditure at £E14,730,000. The principal estimates of revenue were: Land tax, £E5,267,000; customs, £E1,880,000; tobacco excise, £E1,510,000; railways, £E3,525,000; post office and telegraphs, £E405,000; ministry of justice, £E1,260,000. The principal estimates of expenditure were: Civil list, £E277,000; administration, £E4,525,215; railways, £E2,193,658; post office and telegraphs, £E372,367; army, £E1,307,281 (Egyptian army, £E670,831; British army of occupation, £E146,250; pensions £E490,000); Turkish tribute, £E665,041; debt, £E3,931,071; Sudan deficit, £E379,763. The public debt stood on December 31, 1907, at £E94,782,340, exclusive of the domain loan, which stood on July 31, 1907, at £E1,066,920.

ARMY. The Egyptian army is under the command of a British general officer, with the title of Sirdar. The Sirdar in 1908 was Lieut. Gen. Sir Reginald Wingate, who was also Governor-General of the Sudan. In 1908 the Egyptian army numbered 18,273, including 10,280 infantry, 1,258 artillery, 789 cavalry, camel corps 629, Arab battalion 206. British officers to the number of 121 were serving in the Egyptian army. The British army of occupation for 1908-9 was fixed at 5,719. There is no navy.

HISTORY. The opposition was divided into two political parties, the Nationalists and the party of Constitutional Reform. The Nationalists, whose programme was an extreme one, were led by Mustapha Kamel Pasha. On his death (February 10, 1908) he was succeeded as leader by Ahmed Farid. Its demands included nothing short of the immediate evacuation of Egypt by the British. Both the Nationalist Party and the more moderate Party of Constitutional Reform demanded in their programmes the replacement of British officers with natives, the establishment of parliamentary institutions, and the granting of large sums of money for education. The programme of the Party of Constitutional Reform, whose leader was Sheikh Ali Youssef, may be summarized as follows: The authority of the Khedive to be maintained; the establishment of a representative parliament and of complete political and administrative control for the Egyptians over all Egyptian interests; a general and gratuitous system of primary education; the Arabic language to be employed in the government schools; the appointment of Egyptian officials according to their abilities, with a view to rapidly diminishing the number of foreigners in the administration; the jurisdiction of the mixed courts to be extended to criminal cases involving foreigners. In March resolutions were passed by the General Assembly demanding the use of Arabic as the only medium of instruction in all the Government schools, and the establishment of a municipality for Cairo. Sir Eldon Gorst's annual report, published in April, reviewed present conditions and deprecated any further extension of self-government, declaring that it was not desired by the great majority of the upper and middle classes at present, and that the country was not ripe for it. A measure, however, had been pre-

pared looking to the enlargement of the powers of the provincial councils, whereby they would act as advisory bodies, especially in matters pertaining to agriculture, communications, and irrigation. This report was sharply criticized by the Nationalists. During the year the agitation of the Nationalist press against the British occupation was carried on with great violence, and in the later months the fear of its spreading into Upper Egypt and the Sudan and leading to the massacre or capture of travelers in that region, compelled Sir Reginald Wingate, Sirdar of the British Army, and Governor of the Sudan, to issue an edict forbidding tourists to land on the banks of the Nile beyond certain points, or to visit the province of Bahr-el-Ghazel, and parts of Kordofan and of other provinces. At a meeting of the Legislative Council early in December, a motion was unanimously passed asking the Khedive's government for a law granting to the natives a share in the international administration.

EGYPT, EXCAVATIONS IN. See **ARCHÆOLOGY.**

ELECTRICAL COMMISSIONS, INTERNATIONAL. Two international electrical commissions were convened during the year, both in London. The first, the commission on electrical units, adopted definitive values for the concrete international ohm and ampere, and recommended the adoption by all government laboratories of the same manipulation, procedure, and sets of concrete standards for certifying the secondary standards of the various electrical units. The second, the international electrotechnical commission, took up the question of unifying the various national codes of rules for standardizing and rating electrical apparatus. The chief step taken toward this end was the adoption of a resolution that the metric system be the official international system.

ELECTRICAL INDUSTRIES, GROWTH OF IN 1908. The year 1908 in the field of electrical industries, as in many other lines of trade, was a period of "marking time." In some instances there was an actual falling off in comparison with the previous year, but at the end of 1908 all indications were toward an early resumption of a normal rate of growth. The following table was given by one of the leading technical journals as an approximation to what was probably done in the electrical business in the way of sales and earnings for the last two years:

	1908	1907
Electrical Apparatus	\$275,000,000	\$250,000,000
Electrical Railways	350,000,000	350,000,000
Central Stations	225,000,000	225,000,000
Telephony	200,000,000	200,000,000
Telegraphy and Cables	55,000,000	50,000,000
Isolated plant supply ..	100,000,000	75,000,000
Miscellaneous	50,000,000	40,000,000
Total	\$1,255,000,000	\$1,190,000,000

The decrease in the sale of electrical apparatus was due largely to the dearth of new electrical enterprises. As a whole, the railway and lighting industries were at a standstill, although in some of the larger cities, notably New York and Chicago, the volume of business reached new high levels. Telephony felt the effect of the general depression in the large cities, but this was offset by increased activity in the smaller towns and country districts. Telegraphy was crippled by the strike, and isolated plants

by the closing of factories and mills. See **DYNAMO-ELECTRIC MACHINERY, TRANSMISSION OF ELECTRIC POWER, TELEPHONY, ETC.**

ELECTRIC LIGHTING. The rapid rate of growth of the lighting industry, which was so prominent a feature in 1907, received a decided check in 1908, but considering the hard times the lighting business as a whole held its own remarkably well. During the year the principle of State control of the lighting industry and other public utilities became more firmly established. The work done by commissions already appointed has, on the whole, justified their existence and, in general, a spirit of fairness has been manifested toward both the consumer and the supply company. At the close of the year, public utility bills were pending or awaiting introduction in the legislatures of a number of states. The tendency, however, was to curtail the judicial powers of such commissions. For example, the bill proposed for the State of Connecticut contained a section making specific provision for court review of the decisions of the proposed commissions. The art of electric lighting has been advanced during the year 1908 chiefly by improvements in the tungsten and the other metallic filaments lamps, which were first introduced commercially in this country in 1907. The use of the tungsten lamp, in particular, became more and more general; its popularity was greatly increased first, by a reduction in price, and second, by the introduction of a 25 watt or 20 candle power size. Practically all sizes of these lamps were manufactured so that they could be set at any reasonable angle without danger of the filament breaking. Compared with the ordinary carbon filament lamp, the tungsten lamp was shown to be about three times as efficient and had twice the life (barring accidental breakage), but the first cost was about four times as much and the filament was far more fragile. The high cost and increased danger of accidental breakage, however, was more than offset by the increased efficiency and normal life.

The helion lamp which was heralded in 1907 as the most efficient of all metallic filament lamps, was still in the experimental stage, nor has the Haræus improved form of mercury vapor lamp, in which the containing tube is made of quartz instead of glass, been used to any great extent.

ELECTRIC RAILWAYS. The centre of interest in electric railroading during 1908 and the three years preceding was in the application of electric traction to existing steam railroads. During 1908 there were completed, in whole or in part, several important projects, on which work had been in progress for some years, and plans for extensive electrification on a number of important trunk lines both in this country and in Europe. On account of the heavy capital investment, it was not considered likely that electric traction would supersede steam for long distance haulage under ordinary conditions for some time to come. However, there were recognized certain conditions, namely, (1) for long tunnels, (2) for congested terminals, and (3) where heavy grades or the density of traffic are sufficient to justify the investment. Under the first class came the electrification of the Saint Clair tunnel of the Grand Trunk Railway, and the Cascade Tunnel of the Great Northern Railway; at the end of the year the former was in successful operation and construc-

tion work on the latter was practically completed. The first is a single-phase system; the latter is a three-phase system and was noteworthy as being the first three-phase installation in the United States. The Hudson and Manhattan Railroad also opened its first tunnel for regular traffic in the early part of the year; the trains were operated on a direct-current third-rail system. Under the second class were the New York Central and the New Haven roads in the vicinity of New York, which have now been operated electrically for over a year; each of these roads was planning to extend its electrical service. Following the lead of these two roads, the Pennsylvania Railroad Company was planning to electrify its New York terminal, and toward the end of the year it awarded a contract amounting to approximately \$5,000,000 for equipment for this purpose, including 100 locomotives. The Illinois Central Railroad also adopted plans for the electrification of its Chicago terminal. The electrification of mountain divisions of trunk lines progressed more slowly; the work of the Southern Pacific Railroad undertaken in 1907 was held up on account of financial difficulties, but it was deemed likely to be resumed at a not distant period. The Chicago, Milwaukee and Saint Paul Railroad also adopted plans for the electrification of the mountain division of its Pacific Coast extension.

In Europe there was likewise a considerable advance in the electrification of trunk lines. In Italy about 1000 miles of steam railroad lines either had been changed over to electrical operation or were undergoing this change; the necessary power being derived from various hydro-electric plants. In Sweden, Switzerland and Bavaria the electrification of the state railways was under consideration; in all these countries there being ample power for this purpose. During the year 1908 a single-phase 6000-volt locomotive was also tried out on the experimental track of the Prussian state railways.

The single-phase system for electrical railways has been steadily growing in favor for the last three years. A reliable estimate made in the latter part of 1908 placed the total number of single-phase lines at 27 in Europe and 28 in America, with a total mileage of 782 and 967 miles respectively. Several of these roads were equipped with 15-cycle apparatus, the advantage of this frequency over the standard of 25 cycles being chiefly in a reduction in the weight and improved commutation of the motors. The first 15-cycle line in the United States, between Visalia and Lemon Grove, California, was put into operation in the latter part of 1907. An interesting 25-cycle line completed in the early part of 1908 was the Washington, Baltimore and Annapolis Railway. The plan of connecting these cities by a high speed electric railway had been under consideration for ten years or more and it was for this particular line that the single-phase commuting motor was first proposed (1902) for railway work in the United States. During the year was also completed the first section of the 1200-volt direct current line between Indianapolis and Louisville, this being the first high tension direct current railway in the United States. A number of other new interurban roads as well as numerous extensions to existing roads were put into operation both in this country and in Europe. The

increase in mileage and equipment of city street railways during 1908 fell considerably below the average rate of growth previously maintained.

ELEMENTS. See CHEMISTRY.

ELEVATORS. The installation of high-speed express elevators to the forty-first story of a tower office building and the readiness of manufacturers to go even higher in the case of other structures either in course of erection or proposed, indicated that in 1908 the engineering side of the elevator industry had been developed to a high degree of efficiency. The type of elevator found available for the highest buildings and as actually installed in the lofty tower of the Singer Building and as was planned for the still higher tower of the Metropolitan Life Insurance Company was the Otis direct traction electric elevator. In this form of elevator the electric motor is usually installed at the top of the elevator shaft and carries on its armature shaft a sheave or pulley around which the cable supporting the car and the counterweight passes. The counterweight on the opposite end from the car is of such amount that it acts to balance the weight of the car so that any excess of weight on either side is the load on the motor. The important difference in weight caused by the lengthening or shortening of the cables on one side or the other is compensated by chains which may rest either at the bottom of the pit when the car is at a low point on its travel and there is a greater length of cable on its side, or which may be drawn up as the car ascends. The tractive effort of the motor is exerted on the cable which makes a half turn on the sheave of the armature shaft, and then passes around an idler sheave and again over the main sheave. The speed of the cable and consequently of the car is of course equal to the circumferential velocity of the motor sheave, and the speed of the motor is controlled by a switch in the car worked by the operator. In the Singer tower the elevator going to the 41st story has a rise of about 550 feet, which was the record distance for an elevator in 1908, but the new installation of the Metropolitan Life tower involved an elevator of the same type running from the basement to the 44th story with a rise of 586 feet 1½ inches. There is also an elevator from the basement to the 41st floor with a rise of 537 feet 7 inches and four from the first to the 41st floor with a rise of 525 feet. The Singer Building elevator plant also contains three elevators to the 35th floor and four to the 13th floor, and in the adjoining and connected Bourne Building there are three elevators to the 13th floor and one to the roof, while in the Singer Building proper three elevators run to the 13th floor. Each elevator has a capacity of 2500 pounds at a speed of 600 feet per minute with a car area of about 35 square feet and is equipped with telephone and megaphone, so that each car is constantly in communication with the starter or the engineer. The doors are equipped with pneumatic opening and closing devices and each machine has a recording wattmeter and mileage counter so that the power per car mile is readily obtainable. A remarkably large installation of traction elevators was placed in the Terminal Building in New York City and consisted of 39 such

THE REV. DR. SAMUEL MCCOMB

passenger elevators, 22 of which make the run to the 21st and 22nd stories, while the others are for local traffic. While not realizing the extreme heights of the direct traction elevator, the plunger hydraulic elevator has been found useful and available for certain classes of service and a notable installation was under operation in the City Investing Building, New York City. Here there are 21 elevators, seven of which run to the 26th floor and have a travel of 368 feet, being the highest plunger elevators ever installed. In this type a deep hole is drilled in the ground to carry the cylinder in which the plunger bearing the car on its upper extremity moves. By valves controlled from the car water under pressure is admitted to or passes from the cylinder permitting the plunger to rise or fall as desired. In 1908 the elevator engineer was ready to meet any demands of the architect and even the proposed 62-story building for the Equitable Life Assurance Company was believed to present no unsolvable elevator problems.

ELLIOT, CHARLES WILLIAM. President of Harvard University, resigned that position on October 10, 1908, making May 19, 1909, the date on which his resignation should become effective. The resignation was "regretfully accepted" at a meeting of the fellows of Harvard College on October 26, 1908, and was announced by the Harvard Board of Overseers on November 4, 1908. Mr. Eliot was born in Boston, on March 20, 1834, prepared for college at the Boston Latin School, and graduated at Harvard in 1853. He was a tutor in mathematics, and studied chemistry at Harvard in 1854-58, was assistant professor of mathematics and chemistry at the Lawrence Scientific School of the university in 1858-63, and continued his study of chemistry in Europe in 1863-65, meanwhile investigating educational systems in that country. In 1865 he became professor of analytical chemistry at the Massachusetts Institute of Technology and he held that position until 1869, when he became president of Harvard. He began at once thoroughly to reorganize the university, introducing new methods of teaching and securing, as the occasion offered, the best teachers to be had in the country. He introduced at Harvard the elective system, which has greatly improved the university's educational efficiency, and has since been adopted to a greater or less extent by many of the more important American institutions. He is generally considered the foremost American educator of his time. Mr. Eliot's publications include *More Money for the Public Schools* (1903); *John Gilley* (1904); *The Happy Life* (new edition, 1905), and *Four American Leaders* (1906).

EMBANKMENT. A large embankment, to protect Fort St. Philip, La., from the flood waters of the Gulf, was being built in 1908 along the marshy ground of the gulf coast. Steel sheet piling was used as a core wall, the piles interlocking and being coated with asphalt to make them watertight, while the joints were filled with cement grout. The piles, which are 19 ft. long, project 5 ft. above the top of the levee and for this height were incased in a reinforced concrete wall 6 ft. high and 12 in. thick.

EMERSON, EDWIN. An American clergyman, man of letters and United States envoy, died on November 4, 1908. He was born in

New York City in 1822, graduated at Princeton in 1846, and at the Princeton Theological Seminary in 1849. With Noah Webster he practised law for a time at New Haven, Conn., then reentered the Presbyterian ministry, and was pastor at Dobbs Ferry, N. Y., and in Greencastle, Pa. During the Civil War he went to London and Paris as secret envoy from the United States. He remained in Paris until 1870, and then moved to Berlin, returning to this country in 1889. In 1897 he went to Japan, where he remained for the rest of his life.

EMIGRATION. See IMMIGRATION AND EMIGRATION.

EMMANUEL MOVEMENT. This movement, deriving its name from the Emmanuel Church (Episcopal) in Boston, Mass., where, in November, 1906, a "class for the treatment of nervous disorders" was organized, is an outgrowth of the "Emmanuel Church tuberculosis class," which sought the cure of consumptives in the slums without removal from their homes, by approved medical methods "plus discipline, friendship, encouragement and hope." Encouraged by what they deemed the success of this tuberculosis class, the rector, Rev. Elwood Worcester, D.D., Ph.D., and others, after consultation with leading neurologists, determined to begin similar work among the "nervous and morally diseased." Dr. James J. Putnam, of the Harvard Medical School, presided at the preliminary meeting. He is not now, however, associated with the movement and said in a letter to the *Boston Herald* of November 20th, 1908, "While I have a high respect for the characters and purposes of its founders, I am convinced that the movement is a mistake. It is clear that clergymen, without adequate preparation, are assuming responsibilities of a kind that physicians are not qualified to assume until after years of study and training." Other Boston physicians, however, Drs. Mumford, Pratt, Goldwait and Richard C. Cabot, have agreed to act as an Advisory Committee to the Church, and have expressed an opinion that under certain rules adopted by the Emmanuel clergy "the fundamental object of the movement deserves the support of all physicians and the community generally."

The fundamental principle is thus formulated: "The effective coöperation of physician and minister is of value to many sick persons. Since character is an important factor in the cure of many diseased conditions, especially of the nervous system, we believe that any one who can help to guide, strengthen and enlighten the patient by the influence of moral and religious teaching will be of genuine assistance to the patient and to the physician in charge of the case. In rendering such assistance at the physician's request and with his coöperation we believe the clergyman to be entirely upon his own ground, fulfilling in relation to the individual that time-honored office of ethical and spiritual instruction which in the past he has exercised chiefly at long range to congregations from the pulpit."

The rules provide that the sick are to be received only after examination by, and on the approval of, a physician, whose report is filed with the church records, and that no person shall be treated or referred to any specialist unless with the approval of a physician; so that it shall rest "wholly with the physicians

of this community [Boston] to decide whether a patient should be referred to a neurologist or other specialist, and which cases, if any, are suitable for treatment by moral and religious education at Emmanuel."

A like movement exists in St. Mark's Church, New York, approved by prominent physicians, and in other localities. Thus the Emmanuelists are to be differentiated from "Christian Scientists," "faith curers" and so-called "mental healers" generally by their recognition of the actuality of physical disease and the need of its diagnosis and treatment by medical men. Their pretensions are also more modest, in which regard they are unlike the English Society of Emmanuel, a distinct organization, which, in its official statement of 1906, disclaiming similarity in its aims and practices from those of suggestion or what is called "faith healing," professes to have cured completely, by means of laying on of hands in prayer, cancer and locomotor ataxia, as well as merely functional derangements; whereas Emmanuelism claims that "it is in the field of the functional neuroses that all its real victories have been won," and while not denying the possibility of graver cures says: "An authentic instance of recovery from organic disease through psychical means is what we are waiting for." By thus limiting the class of cases treated it is thought to avoid one valid objection to psychotherapeutics, "its employment in diseases which obviously require physical interference, with the result that many patients have died through sheer neglect."

It is also admitted by the Emmanuelists that while "the active agent in all so-called moral recoveries is faith," they "have made the freest use" not only of suggestion but of subsidiary aids, such as electricity, massage and, to some extent, chiefly with alcoholics, hypnotism. They make no claim to special personal powers, explain the nature of the means employed and "avoid all fetiches and material adjuncts as means of suggestion and rely only upon moral, spiritual and rational means."

Isadore H. Coriat, M.D., one of the collaborators in *Religion and Medicine*, the movement's official exposition, says that the necessity of thorough neurological, psychological or general medical examination before instituting any form of psychic treatment cannot be too often reiterated, that being the only way to avoid grave errors. This he illustrates by a case of incipient cancer of the stomach causing neurasthenic symptoms and only revealed by chemical examination, and by another wherein hysteria had been treated as an organic disease of the stomach. He expresses disbelief that all so-called functional nervous diseases can be treated by psychotherapeutics.

The Emmanuel Movement, therefore, differs from most eccentric schools of healing, religious and mental, by the character of its promoters, their recognition of physical disease and the efficacy of medical science in its treatment, and by their expressed willingness to subordinate their practice to the direction of medical men. It is avowedly an attempt by clergymen to aid physicians in the field of psychotherapy, rather than to act as independent practitioners, and to coöperate also with the "social workers." How far this aim can be effected, how far it will be preserved, how far the practice of the

clergy, especially if the movement become widespread, will fall within the purview of laws regulating medical practice, are topics not susceptible of discussion here. The problematic character of the work is admitted by Dr. Worcester's own expression: "What will be the outcome of this movement no man can say."

EMPLOYERS' LIABILITY. Under the stimulus of President Roosevelt's insistence Congress enacted in June, 1906, a law making interstate commerce carriers liable for injuries to their employees received during employment. The constitutionality of this law had been upheld by some United States courts and denied by others. Two cases (*Houard v. Illinois Central Railroad* and *Brooks v. Southern Pacific Company*) brought to the United States Supreme Court on appeal were decided on January 6, 1908. By a vote of five to four the law was held to be unconstitutional. This law destroyed as defense against liability the ground of contributory negligence by providing that "the fact that the employee may have been guilty of contributory negligence shall not bar a recovery, where his contributory negligence was slight and that of his employer gross in comparison." The law extended to any employee of an interstate common carrier. The grounds for unfavorable decision of the court were as follows: (1) The power of Congress to regulate commerce between the States does not include power to regulate the relations of employer and employed, i. e., these two powers are separate and distinct. Justices White, Day and Moody were of the opinion that Congress could regulate relations of employer and employed in so far as the latter are engaged in interstate commerce. On this point Justice Peckham was in doubt and Justices Fuller and Brewer non-committal. (2) That clause of the law extending its provisions to "any employee" was held unconstitutional because it included employees who might not at the time of injury be engaged in interstate traffic. Justices White, Peckham, Fuller, Day and Brewer concurred on this point. The court held unanimously that the law may properly apply to all persons engaged in interstate commerce. Justice Moody dissented from the second conclusion of the majority on the ground that any court in interpreting and applying the law could discriminate between persons thus employed and those employed only in interstate commerce. The one point of agreement was the negative one that Congress cannot make interstate common carriers responsible for injuries to employees not engaged in interstate commerce.

On February 1, President Roosevelt sent to Congress a vigorous message urging the enactment of a new law drawn to meet the court's objections. Bills were drawn by Senators Knox and La Follette and by Representative John A. Sterling, of Illinois. On April 15 the Sterling bill passed the House by a vote of 302 to 1 (Congressman Littlefield, of Maine), and on the following day it passed the Senate unanimously. It was signed by the President April 22. The new law very specifically confines its provisions to interstate carriers by railroad and to common carriers by railroad in Territories, the District of Columbia, the Canal Zone and other territory governed by Congress. It applies to all cases of injury or death due in whole or in part to the acts or negligence of any officers, agents or employees or to the mechanisms of

BRANCHES OF THE ANGLICAN CHURCH

such a carrier. As in the preceding law, it reverses the "fellow-servant doctrine" that an employee who suffers through the fault of a co-employee cannot recover damages, and specifically provides that an employee's own negligence shall not bar him from recovering damages. It provides, however, that such contributory negligence shall reduce the amount of damages in proportion to its importance as a factor in the accident. The fact of contributory negligence and its importance shall be determined in each case by jury. Moreover contributory negligence shall be entirely disregarded when the accident is due to the failure of an employer to observe a statute designed to protect employees. The liabilities imposed by the statute cannot be avoided by any sort of special contracts with employees, though damages may be reduced by an amount equal to any insurance provided by a railroad for its employees. Suits for damages must be brought within two years of the time of injury.

As an example to the States and to carry out the doctrine of responsibility of employers for the safety of employees, Congress passed on May 30 an act introduced by Representative Alexander, of New York, establishing the liability of the United States government for injuries incurred by those of its employees engaged as artisans or laborers in arsenals, navy yards, construction work on rivers, harbors and fortifications, hazardous work in connection with the Panama Canal or Reclamation Service and in government manufacturing establishments. Any such employee so injured while at work as to suffer disability for at least fifteen days "shall be entitled to receive for one year thereafter, unless such employee, in the opinion of the Secretary of Commerce and Labor, be sooner able to resume work, the same pay as if he continued to be employed." The law makes exceptions of those cases of injury due to the misconduct or negligence of the injured employee himself. If employee is killed and leaves a widow, children under sixteen, or dependent parents, compensation equal to his usual pay shall be paid to these dependents. Compensation is granted only upon application and this must be made as soon as possible in case of injury and within 90 days in case of death.

In foreign countries the most notable feature was the growing sentiment in France, Germany and England in favor of an extension of employers' liability to agricultural employees.

ENGINEERING. See articles on various subjects, as COAL, DYNAMO-ELECTRIC MACHINERY, ELECTRIC INDUSTRIES, ELEVATORS, IRON AND STEEL, SHIPBUILDING, STEAM TURBINES, ETC.

ENGLAND, CHURCH OF. A religious denomination, which is the "Established" Church of England, and the dominant religious body of that country. At the head of the church in England and Wales are 37 bishops, two of whom are archbishops. The bishops superintend the work in each diocese and are aided by the suffragans or assistant bishops, of whom there are 32. There are two convocations or provincial synods of the clergy of the Church of England for the two provinces of Canterbury and York. The Archbishop of Canterbury is the highest dignitary of the church and has the title of Primate of all England. There are in England and Wales about 30,000 clergy of the Church of England, of whom 13,930 are bene-

ficed and 6664 are assistant curates. The number of communicants in the church is estimated approximately at 2,500,000. The church sittings number about 6,000,000. The revenues for church property for the year ending Easter, 1907, were £5,753,557. During the same period there were contributed for home missions £719,605; for foreign missions £836,921; for educational work £79,435; for the clergy, educational and charitable assistance, including funds for widows and orphans, £271,814; for philanthropic work, £580,797. The total sum contributed for ecclesiastical purposes representing the voluntary offerings of the church for the year ending Easter, 1907, was £7,462,244.

The most important event in the history of the Church of England during the year was the Lambeth Conference and the Pan-Anglican Congress, which was arranged as preliminary to the sessions of the Conference. The Lambeth Conference was the 5th conference held and it was opened at London on July 4th and continued in session until August 5th. The Conference comprised the bishops of the Anglican communion. As the result of the Conference there was issued an encyclical letter, which was followed by 78 resolutions in which the mind of the Conference was expressed. Two of these resolutions were on the subject of Faith and Modern Thought; 8 on the Supply and Training of the Clergy; 9 on Education; 7 on Foreign Missions; 4 on the Prayer Book; 2 on the Holy Communion; 3 on Ministries of Healing; 1 on the Anointing of the Sick; 7 on Marriage Problems; 10 on the Moral Witness of the Church; 1 on the Observance of Sunday; 3 in regard to the creation of a Central Consultative Body consisting of bishops chosen by the different provinces throughout the world; 1 on Religious Communities; and 21 on the Various Phases of the Relations between the Anglican Churches and other Christian Bodies. The Pan-Anglican Congress was attended by delegates from Anglican dioceses from all parts of the world. The American representation was very large. At the final service, held at St. Paul's Cathedral, a thank offering from every part of the world was presented, amounting to £333,208. This fund is to be divided among the different parts of the Anglican communion by a commission appointed for the purpose.

ENTERIC FEVER. See TYPHOID FEVER.

ENTOMOLOGY. The YEAR BOOK for 1907 referred to economic work in the United States, especially against the gipsy and brown tailed moth and the San José scale. The third annual report of the superintendent of the work for suppressing the gipsy and brown tailed moth appeared in 1908. The report dealt with the methods employed, both as to direct treatment, as spraying with insecticides, etc., and indirect, as inoculation with parasites. The cost of spraying was said to be from 76.3 cents per tree in woodlands, where the trees are from 30 to 60 feet high, down to as low as 3 cents per tree along roadsides, where trees are from 20 to 60 feet high. At Stonington, Conn., a small colony of the gipsy moth, occupying an area of about one square mile in extent, had established itself. An average of ten men were employed in fighting this colony, and during the year had kept it within bounds. Sanderson reported colonies of this moth in New Hampshire, at a distance of miles from any other known infected

locality. This he interpreted to mean that there was some as yet undiscovered method of distribution. Professor Kincaid, of the University of Washington, was sent to Japan by Dr. L. O. Howard, to attempt to secure parasites of the gipsy moth. For the expense of the work against the gipsy and brown tailed moths, the U. S. Dep't. of Agriculture had, for 1908, an appropriation of \$250,000. The cotton boll weevil was estimated in 1908 as doing an annual damage of \$25,000,000, in the southern part of the United States. It was suggested that the most practical method of treatment was to pick the cotton as early as possible, and immediately destroy all stalks of the cotton plants as well as weeds, etc., growing along fences. This, by destroying their food, will largely prevent the later broods from developing, and, since these are the most likely to hibernate, will greatly decrease the number ready to attack the crop of the following spring.

The continued spread of the elm leaf beetle in the United States was still attracting the attention of the economic entomologists. Dr. Howard reported that he had secured from Dr. Paul Marchal of Paris, the eggs of a chalcidid, *Tetrastichus xanthomelænae* which the latter had observed as a parasite of the beetle at his home near Paris. During the summer of 1908 specimens of the parasites were liberated in eastern Massachusetts, at Ithaca, N. Y., at New Brunswick, N. J., and at Washington, D. C. Satisfactory progress was reported from all these localities except Ithaca, where the parasites all died. It is confidently expected that by 1909 they will have increased so much in the other places, that some definite effect on the beetle will be observed.

From New Orleans and the adjoining country comes the report of a serious insect pest in the form of an ant, *Iridomyrmex humilis* Mayr., which promised eventually to be as injurious in that section as was the gipsy moth in Massachusetts. It probably was imported from South America in sacks of coffee, and was popularly known in New Orleans as the Argentine ant, though in other sections it was generally known as the "New Orleans ant." It was said not to be affected by the usual repellants, and to swarm through all the rooms of dwelling and business houses, so that it became a matter of very great difficulty to keep foodstuffs free from it. In some parts of Louisiana it was reported as doing great damage to farmers' crops, both because it feeds on orange buds and the ripe figs, and on seeds such as lettuce which it takes from the ground after sowing and before they have time to sprout. In addition it colonizes a scale insect on sugar cane, thus indirectly doing much damage to this crop.

From Massachusetts came a report of a parasitic fly, *Protocalliphora chryorrhæa*, which lays its eggs on the young bluebirds. In one case observed, out of eight birds in two successive broods, only one survived, the rest having been killed by this parasite. Marchal, in France, and Woodward and Pierce in the United States discussed the question of parasitic control of insect pests, and agree that so far from being a simple question, it really is a most complex one. According to Marchal, in considering the value of any insect parasite in this connection, we must consider, in addition to the fecundity of the parasitic species, at least eight other factors. 1. What secondary parasites may at-

tack the primary, and are there possibly tertiary parasites on these? 2. Are there coparasites, or other species living on the same host? 3. Are there other plant feeding species beside the host species? 4. Are there insectivorous birds which attack both host and parasite? 5. Are the climatic conditions favorable or unfavorable to either host or parasite? 6. The rapidity with which generations are developed. 7. Is there a tendency in the host species to delay the development of certain individuals for a longer or shorter time? 8. Does the parasite show any tendency toward a process similar to ? Pierce and Woodward argued along essentially these same lines, especially calling attention to the fact that unless a parasite is able to adapt itself to the environment as well as is the host, and able to multiply as fast as it, there is no practical advantage in importing the parasite. In *Farmers' Bulletin* No. 155, 1908, Dr. L. O. Howard published a popular account on "How Insects Affect Health in Rural Districts," dealing especially with mosquitos and flies as carriers of malaria and yellow fever, and typhoid fever, respectively. M. E. Robaud reported to the Paris Academy of Sciences some experiments which strengthened the theory that pathogenic trypanosomes are carried by the tsetse fly. When the fly has fed on the blood of an infected animal the trypanosomes may be seen in the blood inside the insect's proboscis. Here they multiply and form little colonies, and are set free if treated with salt solution. He did not test the result of experimental infection by the bite of the fly.

In addition to the gipsy moth appropriation mentioned above, the Bureau of Entomology received \$184,960, and the Bureau of Animal Industry, for the eradication of the cattle tick in the South, received, in addition to its regular appropriation of \$1,080,860, the sum of \$250,000.

In view of the part which the common house fly plays in the transmission of disease, mainly typhoid, a series of papers by C. Gordon Hewitt, appearing in the *Quarterly Journal of Microscopical Science*, on the "Structure, Development and Bionomics of the House Fly," were of interest. The papers so far as printed in 1908 dealt mainly with the early development. The author noted that in nature, these animals breed more readily on fermenting horse manure than on any other substance.

EPILEPSY. The relation of eyestrain to epilepsy was investigated by Moore and Hodskins at the Massachusetts Hospital for Epileptics. Eighty-eight cases were placed on full mydriasis (pupil dilatation) so as to eliminate eyestrain and paralyze accommodation for one full month. The average number of epileptic seizures during this period was compared with the average of other months and found not to vary materially. The authors conclude that while eyestrain may play an important rôle in individual cases, ocular defects have no general relation to the production of the disease. Spratling described the work at the Craig Colony for epileptics at Sonyea, N. Y., and considers the granting of the legal right to make autopsies on the brain and spinal cord of epileptics dying there, together with the study of living matter, the secretions, the psychic and organic life, as the two most promising steps in the study of epilepsy in recent years. He predicts that within 25 years this disease will be as curable

as insanity is now, namely, in from 25 to 30 per cent. of all cases. To an already impressive mass of statistics showing the direct relation of alcoholism in parents to epilepsy in their children, Lundborg contributed the results of a study of the records of the Upsala Hospital in Sweden. The records point to the frequent coincidence of parental alcoholism and filial epilepsy and also to the association of insanities and epilepsy in brothers and sisters. In 32 instances out of 2000 records epilepsy occurred in one member of a family and mental derangement in another.

EPISCOPAL CHURCH, REFORMED. See **REFORMED EPISCOPAL CHURCH.**

EPWORTH LEAGUE. An organization of the young people of the Methodist Episcopal Church, founded in 1892. During 1908, 493 new charters were issued to senior chapters and 367 to junior chapters. Among its other branches the League carries on important work among the negroes in the South and in home and foreign missions. The training of workers in the Epworth League Institute was carried on vigorously in 1908. The League is the largest society of young people in the world.

ERICHSEN, L. MYLIUS. A Danish explorer, died of exposure on the northeastern coast of Greenland, about November 25, 1907. See **POLAR RESEARCH.**

ERITREA, OR ERYTHRÆA. An Italian colony on the African coast of the Red Sea. Area, about 50,000 square miles, including some islands in the Red Sea; population in 1906, 279,551 (274,944 natives, 3949 Italians, including the militia, and 658 others), largely nomadic. Massowah, the principal port, has 2275 inhabitants. Asmara, not far from the Abyssinian border, is the capital. The climate is equatorial. There is hardly any agriculture, owing to the lack of water. Pasture is abundant, and camels, cattle, sheep, and goats are raised. Pearl fishing is carried on at Massowah and the Dahlak archipelago by the Italian Pearl Fishery Company, the annual value of the product being about 250,000 lire (1 lire equals 19.3 cents) for pearls and 800,000 for mother-of-pearl. Gold mining is carried on near Asmara. The principal exports are hides, mother-of-pearl, wax, butter, gum, ivory, and coffee. The imports are cotton goods, durrah, flour, wool, and wine. In 1906 the imports of Massowah amounted to 10,100,184 lire, the exports, 2,444,484 lire, and the transit trade, 2,081,728 lire. There is a railway of 47 miles from Massowah to Ghinda, which is being continued to Asmara; in 1908 the Ghinda-Nefasit section, 16 miles long, running along the sides of the hills between Ghinda and the highlands, was completed. Another section, 9 miles long, starts northwest from Asmara. In 1908 there were 869 miles of telegraph line connecting Massowah, Assab, Perim, and Addis Abeba, capital of Abyssinia. The budget of the Italian colonies for 1908-9, which covered also Italian Somaliland (q. v.), estimated the local revenue at 3,118,500 lire, and the subvention of Italy at 7,557,960 lire. The Governor in 1908 was S. Raggi. By the treaty of May 16, 1908, with Abyssinia, the boundary line of Eritrea runs from the eastern point of the boundary between Eritrea and Tigré (Mareb River), as determined by the convention of 1900,

in a southeast direction parallel with the coast, at a distance of 60 kilometers (37.26 miles) from the latter, down to French Somaliland.

ESMARCH, JOHANNES FRIEDRICH AUGUST VON. A German surgeon, died on February 23, 1908. He was born at Tönning, in Schleswig-Holstein, on January 9, 1823, studied medicine at Kiel and Göttingen, and served as a surgeon during the Danish War of 1848. In 1854 he became director and in 1857 professor in the clinic of the Kiel Hospital. He was again in active field service during the Schleswig-Holstein War of 1864, and during the Franco-Prussian War he was physician-general and consulting surgeon to the army. Thereafter he renewed his association with the Kiel Hospital, and also was consulting surgeon at the principal military hospital in Berlin. For many years he was considered the leading authority on gunshot wounds; he invented the bloodless method of operating on the extremities by bandaging and pressing the blood out of the limb before applying the tourniquet; and he introduced many improvements in barrack hospitals, ambulances and field service appliances. Es-march is familiarly known as the originator of the triangular bandage bearing his name included in the "first aid" packages, also his idea, which is carried in some form or other to-day by every soldier. His plan was to have the soldier apply an antiseptic dressing to a wound which would not be disturbed until a proper hospital was reached. In recognition of the value of his services he was made a Privy Councillor in 1897. His many contributions to medical literature include: *Ueber Resektionen nach Schusswunden* (1851); *Beiträge zur praktischen Chirurgie* (1853-60); *Ueber den Kampf der Humanität gegen die Schrecken des Krieges* (1869); *Der erste Verband auf dem Schlachtfelde* (3d. ed. 1899) and *Handbuch der Kriegschirurgischen Technik* (1877 and afterwards).

ESPERANTO. See **INTERNATIONAL LANGUAGE.**

ETHICAL CULTURE, SOCIETIES FOR. A system of societies formed in New York City in 1876 by Felix Adler to provide a centre for persons who had lost their attachment for traditional creeds and desired to aid in promoting the moral development of the individual and of society. To this end it engaged in various forms of philanthropic activity, inaugurating such work as district nursing, and making education its special concern. The Ethical-Culture School had its beginning in 1878 in the establishment of the first free kindergarten in the State. The membership of the Society in 1908 was over 1,000, and the membership of the societies in Chicago, Philadelphia, and St. Louis numbered about 700. These societies are federated in the American Ethical Union, which conducts a Summer School of Ethics, held in 1908 at Madison, Wisconsin, in connection with the summer session of the University of Wisconsin. The Union is in turn related to the International Ethical Union, which at a congress at Eisenach, Germany, in 1906, adopted as its basis this declaration: The general aim of the Union is: To assert the supreme importance of the ethical factor in all the relations of life—personal, social, national and international, apart from all theological and metaphysical considerations. The Ethical Union does not wish to be understood as promulgating any special religion, based on a particular belief, and regards ethical re-

ligion as the necessary crown of religious thought.

ETHNOLOGY. See **ANTHROPOLOGY.**

EUCKEN, RUDOLF CHRISTOPH. A German philosophical writer, was awarded the Nobel prize for literature, in December, 1908. He was born in Aurich, East, Friesland, on January 5, 1846, studied philology, history and philosophy at Göttingen, and was professor of philosophy at Basel from 1871 to 1874, when he took the same chair in the University of Jena. His publications include, *Geschichte und Kritik der Grundgriffe der Gegenwart* (1878; 2d ed. 1892); *Die Lebensanschauungen der grossen Denker* (1890; 5th ed., 1903), and the following articles, which have been translated into English: "Liberty in Teaching in the German Universities" (1897); "Are the Germans Still a Nation of Thinkers?" (1898); "Progress of Philosophy in the Nineteenth Century" (1899); "The Finnish Question" (1899); "The Philosophy of Friedrich Froebel" (1900); and "The Present Status of Religion in Germany" (1901).

EVANGELICAL ALLIANCE FOR THE UNITED STATES. A religious organization, founded in 1867, whose object is "to manifest and strengthen Christian unity, to defend and promote religious liberty, and to encourage co-operation in Christian work, without interfering with the internal affairs of the denominations." By united remonstrances the alliances have defended and promoted religious liberty in countries where religious persecution was severe and persistent. They have also promoted the observance of an annual week of prayer in all Christian lands, and in all mission fields, during the week beginning with the first Sunday of the year. As its name and object imply, the Alliance is undenominational and all the evangelical bodies are represented in its Board of Directors. Fortunately, the necessity of opposing religious persecution is increasingly infrequent; and the manifestation of co-operating Christian unity is now attained in manifold ways and by manifold agencies. Yet the Evangelical Alliance stands ever ready to act, if its action can be of real service. The President is Dr. Leander T. Chamberlain.

EVANGELICAL ASSOCIATION. A religious denomination represented for the most part in the United States and Canada, and in Germany and Switzerland, founded in 1800 by Jacob Albright. Its origin was among the Germans in Pennsylvania. The church policy of the Association is essentially Methodist. The membership in 1908 was 131,437, with 1861 churches, and 430 local and 1173 itinerant preachers. A Biblical Institute and a College are maintained by the church at Napier, Illinois, and a publishing house at Cleveland, Ohio. An important organization connected with it is the Young People's Alliance, which has a membership of over 40,000. Domestic missions receive attention and foreign missions are carried on in Japan. The Association publishes several periodicals, the most important of which is the *Evangelical Messenger*, published at Cleveland, Ohio. It has other publications in English and German.

EVANS, SIR JOHN. A distinguished English antiquary, died on May 31, 1907. He was born at Britwell Court, near Berkhamsted, on

November 17, 1823, and became identified with a large paper manufacturing concern in Hertfordshire. He devoted much time to study of the classics, in which he became exceedingly well versed; and, especially, to antiquarian research. To numismatology he gave particular attention; and he published in 1864, *Coins of Ancient Britain* (with a supplement in 1890). He also studied geology, and published in *Archæologia*, in 1860 and 1862, two very valuable papers on "Flint Instruments in Drift." Other valuable contributions to archæology were *The Ancient Stone Implements, Weapons and Ornaments of Great Britain* (1872; 2d ed., 1897), and *The Ancient Bronze Implements, Weapons and Ornaments of Great Britain and Ireland* (1881). He was president of the Geological Society in 1874-76, treasurer of the Royal Society in 1878-98, president of the Society of Antiquaries in 1885-92, president of the Anthropological Institute in 1877-79, and president of the British Association in 1897-98.

EVANS, ROBLEY DUNGLISON. An American rear-admiral, retired from active service on August 18, 1908. He was born in Floyd County, Va., on August 18, 1846, and graduated at the United States Naval Academy in 1863. He was promoted to the rank of lieutenant-commander in 1868, commander in 1878, captain in 1893, and rear-admiral on February 11, 1901. In the Civil War he took part in both attacks on Fort Fisher (January 15, 1865), and was severely wounded during the land engagements. He commanded the *Yorktown*, at Valparaiso, Chile, in 1891, during the strained relations between that country and the United States, and the battleship *Iowa* in the Spanish American War. Rear-Admiral Evans subsequently was in command of the North Atlantic and other squadrons for several years, and in 1908, though in bad health, took the Atlantic fleet from Hampton Roads around South America to San Francisco. Here he was relieved of the command of the fleet on May 8, being succeeded by Rear-Admiral Charles S. Sperry, and was assigned to duty on the General Board.

EVOLUTION. See **BIOLOGY.**

EWALD, CARL. A Danish novelist and poet (of German birth), died in March, 1908. He was born in Schleswig, on October 15, 1856, his father being a farmer who had written some novels. After the war of 1864, the family removed to Copenhagen, and Carl was educated at the university there. Upon leaving the university he became a forester for a time, and then taught school. From 1887 he made his home in Copenhagen, where he devoted himself entirely to literary work. He published at first school books, and then translated short satirical sketches and novels for newspapers. In his novel, *The Old Room*, and its sequel, or companion, *Cordt's Son*, the first considers the changes in the character of a man who deserted a conventional life for one of freedom from restraints; the other, the psychology of his son, who regarded the social conventions. Both are vivid, if somewhat morbid, studies, containing much profound moral analysis, and the style of each is marked by skilful technique, and beauty of language. *Singletons Tidenårsrejse* (1894), and *Glaede over Danmark* (1895), are brilliant and bitter satires on Danish life, especially in literary circles. *Sulamiths Have* (1898) is a series of comic stories after the manner of Boccaccio. In his seven *Stories for*

children (1882 to 1900) and his *Four Princes* (1895) he makes use of natural phenomena in an original and amusing manner, sometimes by means of allegories, and often with a didactic purpose. Especially fantastic books for children are *Der Kinderkruezzug* (1896; German translation, 1899), and *Crumlin* (1900), while *Mein Kleiner Junge* (1899) develops an ideal theory of juvenile education. *The Old Room* and *Cordt's Son* have been well rendered into English by Alexander T. de Mattos (1908), and the translation of the remainder of this author's works into that language was under way.

EXPERIMENT STATIONS, AGRICULTURAL. See AGRICULTURAL EXPERIMENT STATIONS.

EXPLORATION. The larger events of pioneer exploration in 1908 related to Central Asia and Northeast Greenland (see POLAR RESEARCH). The most important work in Asia was that done by Dr. Sven Hedin (q. v.) who completed his journeys in the vast regions of Western Tibet from its northern to its southern border. These regions were unknown except along the routes of a few earlier European explorers, and those of one or two Indian surveyors in Southern Tibet. The fact that gives special significance to Dr. Hedin's latest researches (1906-08) is that he crossed western Tibet twice from north to south and proved that this part of the lofty plateau, marked "unexplored" on the maps, is surmounted by range after range of mountains extending east and west so that the whole surface consists of roughly parallel lines of elevations with intervening valleys in which are many lakes, most of them salt. He has thus made clear all the larger topographical aspects of western Tibet. His predecessors were not able to do this because they mainly followed the valleys from west to east and were unable to say that what they saw of the relief forms of the land was typical, as it is in fact, of the entire western plateau.

During his north-south journeys in 1906 and 1908 Dr. Hedin crossed the southernmost and greatest of these ranges. He conceived the idea that this very high and complicated mountain system was the continuation of the Nienchen-tang-la range south of Tengri Nor, whose highest summit had been fixed by Ryder at 29,900 feet. In his east-west journey of 1907, Dr. Hedin gave special attention to this mighty range and filled gaps in our earlier information which prove that the range extends clear across Tibet and far to the west of it. These mountains have been heralded as an original discovery by Dr. Hedin which is not quite accurate. Some of the peaks were triangulated in 1904 and the range is referred to in the writings of Burrard, Hayden, Hodgson, Littledale and Montgomerie. But Hedin has proved the continuity of the range by studying it along a stretch of 100 miles where no other explorer had been within sight of it and he has crossed it ten times. He proposes to call this greatest of the Tibetan mountain systems the Trans-Himalaya range and the name will probably be adopted. It is a magnificent region of lofty snow peaks, surpassing, in Dr. Hedin's opinion, every other range in Asia with the exception of the culminating range of the Himalayan system.

The great geographical results of Dr. Hedin's latest explorations are: (1) The revelation of the main topographic features of the whole of western Tibet. (2) The discovery of a part of

the Trans-Himalayan range and the careful exploration of it. (3) The complete exploration of the large white space on the maps of southern Tibet north of the Brahmaputra river from Shigatse in the east to Gartok in the west. (4) His discovery of the Tibetan provinces of Bongba and Chohcu and his proof that the province of Dokthol, on our maps, does not exist. (5) The discovery and exploration of the main branch of the Indus. As he also visited the actual source of the Brahmaputra his map of it is likely to be more accurate in detail than that of Rawlings and Ryder. He was also able to strengthen the theory that the Sutlej has its source through an underground connection with Tso Lanak. Throughout his three years' work he traveled in Tibet in spite of the absolute prohibition of the Indian and Tibetan governments, disguised much of the time as a native, and playing the rôle, when he met strangers, of the servant of his head man. Returning to Europe in January, 1909, he brought with him innumerable observations and maps which will enable him to draw a map of the whole of Tibet on a scale of 16 miles to an inch. He intends to publish, as soon as possible a popular account of his travels but some years will elapse before his scientific report and results will be ready for publication.

Very notable, also, is Dr. M. A. Stein's second series of explorations in Central Asia which he began in 1906 and ended late in 1908. It will be remembered that on his first expedition he recovered many manuscripts and other testimony from the ruins he unearthed in the desert sands of Eastern Turkestan proving that the culture of India and even the influence of the Roman Empire had reached that remote region in the early centuries of the Christian era. His last two years' work has covered large areas from southwestern Chinese Turkestan to the extreme northwestern corner of China proper, including both archaeological and geographical researches. He has discovered two hitherto unknown extensions of the Chinese Wall among the mountains at its western end, one to keep out incursions from the north, and the other to close the great route to Central Asia at a later period when China resumed her traditional attitude of exclusion. With the aid of one of the best surveyors of the Indian government, he has mapped 17,000 square miles of mountainous land in the Chinese province of Kansu and along the northern and southern confines of Eastern Turkestan. He has crossed the great Takla-Makan desert, has found many more ruins of towns and Buddhist shrines, and fifty camels were required to transport his collections of sculptures, paintings, manuscripts and other antiques to the foot of the Karakoram for transportation to India. He followed Marco Polo's route for hundreds of miles and found that this famous explorer's description of it was accurate. He traced and mapped the Khotan river to its source among the upper snows of the Kwenlun Mountains. The only accident occurred on the last day of this two years' work, when Dr. Stein's feet were severely frostbitten. He was carried on a litter to Leh, the outpost of civilization in Cashmere.

Dr. Merzbacher, the Austrian geologist, resumed his explorations in the Tian Shan Mountains, already the topic of one of his books. Capt. d'Ollone has found wholly unexpected conditions near the sources of the Hoang-ho, in eastern Tibet, where the land is a plain 13,000

feet high, covered with grass and everywhere passable by horses, the inhabitants being neither Tibetan nor Chinese but approaching the Aryan type. Dr. and Mrs. Workman continued their splendid mountaineering activities among the Hunza, Nagar and Hispar glaciers in the Himalayas. Dr. Longstaff has been engaged in scientific researches in the northwest Himalayas and Captain Kozloff of Russia devoted the year to the exploration of the Mongolian deserts and of the Koko-nor basin and is still in the field.

Africa is still flooded with explorers but pioneer work has been practically completed and research is everywhere assuming a specialized character. The greatest achievements are rewarding the French in the Sahara. The government is establishing military posts in many parts of its Saharan domain and with every expedition for military or other purposes are men competent to enrich scientific geography. The result is a large output of literary and map material which is throwing a flood of light upon the present and past condition of the Sahara and its inhabitants. It is impossible here even to mention the names of the men engaged in this labor, but Arnaud, Cortier, Lemoine, Niéger, Vélain, Gautier and Martin are very prominent among them. It has been found that, in more humid times, a wide zone in the southern Sahara supported a large agricultural population; that the ground waters flow far south of the northern edge of the desert and new oases may be created by artesian irrigation; and that a considerable grazing industry exists among the Tuaregs in the valleys among the Ahaggar Mountains in the heart of the desert. A regular mail service was established in 1908 among many of the military posts and the telegraph, now in operation about one third of the way across the desert, will be extended to the Niger river.

The most extensive African work of the year was carried on by the German party led by the Duke of Mecklenburg which, entering German East Africa in 1907, emerged late in 1908 at the mouth of the Congo after many months devoted to map surveys and geological, zoological, ethnographical and other researches. The volcanic region north of Lake Kivu received especial attention and the party reports that vulcanism is dying out there, progressively from east to west. One of the strangest tragedies of African exploration befell this party among these mountains where, a few degrees south of the equator, twenty of their native porters perished in a violent snowstorm in the crater of an extinct volcano. The equatorial forest was crossed, large collections were made and the labors of the various experts promise a rich harvest of results. One of the best sources of precise geographical data in Africa is still the work of the boundary commissions which, for several years, have been delimiting the colonial frontiers. Many other agencies are also helping towards a more exact knowledge of African geography as, for example, the railroad surveys that have recently determined scientifically the elevation of a large number of points between the Congo and the Nile rivers.

The largest geographical service in the western world is now performed by the Surveys of the United States and Canada which are rapidly pushing the scientific mapping of their vast areas. The production of similar topographic maps is also in progress in Argentina and Chile and the Survey Department of the State of São

Paulo, Brazil, has been producing map sheets of the first quality. Such maps will be of the greatest assistance in studying the geography of the areas they cover and in the improvement of atlas maps. As an example of the wide utility of such surveys it may be mentioned that the admirable map sheets which Major Fawcett is producing for the government of Bolivia while carrying out the delimitation of the frontiers of that country, are to be used in the preparation of a new map of a part of South America which the Royal Geographical Society of London is about to produce.

There is not much left to explore in Australia, but every year the governments of the various states, all of which have excellent Survey Departments, are adding to exact knowledge of that continent by the detailed maps they are publishing; and Mr. Canning, by his recent journey from south to north across western Australia showed that there is still room for the pioneer explorer. He has found a route along which, he believes, sufficient water can be obtained to make it serve as a cattle drive.

Pioneer research was nowhere more active in 1908 than in New Guinea, the second largest island in the world. The Dutch are rapidly pushing the exploration of their western part of the island and in 1908 they found that a considerable number of the highest mountains in the Charles Louis range are perpetually snow-crowned. Their work, in combination with the explorations in British New Guinea, points to the probability that the Charles Louis range joins the British mountains, giving New Guinea a backbone of mountains extending through the island from its eastern to its western extremity. The recent travels of five or six British explorers have shown the important width of the British New Guinea mountains both north and south of the main Owen Stanley range. The publication of their map results on one sheet, in September, was the best recent contribution to our knowledge of the island.

EXPOSITIONS. No great international exposition was held during the year 1908, but in London, England; in Rio de Janeiro, Brazil; and in Glasgow, Scotland; important industrial exhibitions were held that deserve mention.

THE FRANCO-BRITISH EXHIBITION, held in London from May 11 to November 8, was the greatest of these. On a site in the suburb of Shepherd's Bush, covering 140 acres, there were 125 principal buildings and 400 minor structures. Twenty-two palaces were erected, seven of which were devoted to fine arts, decorative art, applied art, music, women's work, science, social economy, hygiene, chemical industries, machinery and botanical products. It was estimated that \$15,000,000 were spent on labor and materials before the opening, and that the goods exhibited were valued at \$60,000,000. All the buildings were absolutely fireproof. The exhibition was formally opened by the Prince and Princess of Wales and on May 26 it was visited by President Fallières of France. The average daily number of visitors was 80,000; the total attendance being in the neighborhood of 11,760,000. Nearly \$2,500,000 in shillings was taken at the entrances. An important feature of the Exhibition was the Olympic games (q. v.) which were held during the fortnight beginning on July 13. In the "Irish Village of Ballymac-linton" was an exact copy of the McKinley cottage in which it was claimed that the ancestor of President McKinley was born in Bally-

FRANCO-BRITISH EXPOSITION AT EARL'S COURT
GENERAL VIEW OF THE GROUNDS

money. The exhibition gained for itself the name of the "White City."

BRAZILIAN NATIONAL EXPOSITION. This was held in Rio Janeiro to celebrate the one hundredth anniversary of the opening of the ports of Brazil to international commerce. It was opened on August 11 and continued for four months. There were large palaces devoted to the greater industries and each state in the Republic erected a pavilion in which its natural and manufactured products were exhibited. The exhibition was regarded as a success but the attendance, owing to an epidemic of smallpox, was small and never exceeded 40,000 a day.

SCOTTISH NATIONAL EXHIBITION. This exposition held in Glasgow was a success and the aggregate attendance exceeded those of the exhibition in 1886 and in 1900. It achieved the record single-day attendance of 65,140, which had been previously held by Edinburgh with an attendance of 62,981 in 1886.

ALASKA-YUKON-PACIFIC EXPOSITION. During 1908 preparations were being made for this exposition to be held in Seattle, Washington, from June 1 to Oct. 15, 1909, for the purposes of exploiting the resources and potentialities of the Alaska and Yukon territories in the United States and the Dominion of Canada; as well as to foster the trade of the Pacific Ocean and the countries bordering on it; and to demonstrate the progress of western America. A tract of land covering about 255 acres on the campus of the University of Washington, fronting on Lakes Union and Washington, was chosen as a site. Eleven large exhibition palaces (of which those devoted to manufactures, liberal arts, and education, agriculture, horticulture, and irrigation, machinery, fine arts, fisheries, and mining were completed in 1908) were provided for, and 23 States announced their intention of erecting buildings. A system of landscape gardening with a unique floral display was planned under the direction of John C. Olmsted of Boston. The exhibition was located within 20 minutes ride by electric cars from the centre of the city and four double track lines extended to the grounds. The funds for this exposition began with a subscription of \$650,000 by the citizens of Seattle, which was increased to \$2,200,000 by an appropriation of \$1,000,000 from the State of Washington and of smaller amounts from various counties and municipalities. Congress appropriated \$1,175,000 for defraying the expenses of participation by the government and its non-contiguous territories in the Pacific. It was estimated that the preliminary cost of the exhibition would be \$10,000,000. In July President Roosevelt appointed as the Government Board of Managers: Assistant Secretary of the Interior J. E. Wilson, chairman; W. de C. Ravenel, of the National Museum, and W. M. Geddes, of the Treasury Department, secretary and disbursing officer.

JAPANESE WORLD'S FAIR. The great exposition which it was proposed to hold in Tokio, Japan, in 1912 was, in consequence of the financial condition of Japan, ordered postponed by the Imperial government to 1917. Congress in May passed a bill appropriating \$1,500,000 for the expenses of representation and participation by the United States in that event. It further authorized the appointment of three commissioners-general. President Roosevelt appointed Francis B. Loomis of Ohio, Frederick J. V. Skiff of Illinois, and Francis D. Millet of New York, as commissioners-general, to act under

the direction of the Secretary of State. These commissioners visited Japan during the year in order to ascertain the general plan and scope of the exposition, the character, size and cost of the buildings to be erected by the United States and the extent and characters of an exhibit that best would serve the interests of the United States and its citizens, and "best adapted to illustrate the growth and development of the country and the character of our people."

OTHER EXPOSITIONS. An exposition was announced for Quito, Ecuador, in 1909 in commemoration of the first centennial anniversary of the political emancipation of that country, for which a board to have general supervision of the exhibits of the United States was appointed by President Roosevelt. An international exposition of photography at Dresden, Germany, in 1909 was in active preparation. It was announced that in 1910 there would be an International Shooting and Field Sports Exhibition held in Vienna, Austria, for which an appropriation of \$250,000 was recommended to Congress by President Roosevelt for a government exhibit of game birds and wild animals. Also announcement was made of an exposition to be held in Turin, Italy, in 1911.

FAILURES. See **FINANCIAL REVIEW**, *Failures*.

FALK, MAX. A Hungarian journalist and politician, died on Sept. 10, 1908. He was born at Pest on Oct. 17, 1828, and was educated in Pest and at the polytechnic school at Vienna. After a brief term as editor of the *Wandrer*, in Vienna, he was appointed lecturer on Hungarian History and Literature to the Empress Elizabeth (1866). In 1869 he was elected a member of the Hungarian Parliament. His writings—mostly short articles—appeared in the *Österreichische Revue* and in *Pesther Lloyd*. He was editor of the latter for several years, retiring in 1906.

FALKLAND ISLANDS. A British crown colony in the South Atlantic, consisting of the islands of East Falkland, 3000 square miles; West Falkland, 2300 square miles; South Georgia, uninhabited, 1000 square miles; and about 100 uninhabited small islands, 1200 square miles; total area, 7500 square miles. Population, 1901, 2043; 1907 (estimated), 2266. Port Stanley, the chief town, on East Falkland, has 916 inhabitants. The principal occupations are sheep raising and the repairing of ships coming to Port Stanley in their voyage around Cape Horn. The pasturage covers 2,325,000 acres. In 1906 there were on the islands 702,696 sheep, yielding 4,324,215 pounds of wool. Other products of the sheep ranches are tallow, pelts, hides, etc. Some whaling is also carried on. The large peat deposits are not worked. In 1907 the imports amounted to £73,619 (£68,091 from Great Britain), and the exports, £246,436 (£195,571 to Great Britain). The principal export is wool, valued at £166,859 in 1907. The revenue is derived mainly from customs and rents of crown lands. Revenue and expenditure in 1907 were £17,430 and £18,054 respectively. The Governor in 1908 was H. E. W. Lamond Allardyce.

FARM ANIMALS. See **STOCK RAISING**.

FARM EDUCATION. See AGRICULTURAL EDUCATION.

FARREN, WILLIAM. An English actor, died on Sept. 25, 1908. He was born in England in 1825, and made his first appearance at the Strand Theatre, London, in 1850. During the period 1853-1867 he was at the Haymarket Theatre, where he played in revivals of old comedies and in numerous sentimental dramas; of the latter, *The Secret Agent* was one of the most popular. He played at the Vaudeville Theatre from 1872 to 1878. While here he appeared in *Our Boys* during the whole of its extraordinary run of 1100 nights. Leaving the Vaudeville, he went to the Criterion, where he appeared with Sir Charles Wyndham in *David Garrick*. About 1888 he retired, and settled in Italy for the remainder of his life. Farren's best work was done in comedy rôles; among his most popular impersonations were Captain Absolute, Charles Surface, Sir Peter Teazle, and Adam (in *As You Like It*). His father and grandfather were both distinguished actors, and his son is a well-known comedian.

FAUSBÖLL, MICHAEL VIGGO. A Danish Oriental scholar, died on June 3, 1908. He was born at Hove, Denmark, in 1821, was assistant in the library at Copenhagen in 1861; and became professor of Indo-Oriental languages at the University of Copenhagen in 1878. His fame rests chiefly on his translation of the *Jâtaka*, a collection of folk-tales written in Pâli, an ancient language of India. He published the work in sections, of which the first, *Five Jâtakas* (with Eng. trans.), appeared in 1861. Then followed *Two Jâtakas*, (1870); *Dasaratha Jâtaka* (1871); and *Ten Jâtakas* (1872). In 1877 he published the first volume of the complete collection; the sixth and last volume appeared in 1896.

FEDERAL COUNCIL OF CHURCHES OF CHRIST IN AMERICA. An organization formed as the result of a meeting of 500 officially appointed delegates of 30 religious denominations, held in New York City, Nov., 1905. These delegates recommended a plan of federation which has since been adopted by the official action of the National Conference of Churches, representing an aggregate membership of about 15,000,000. The object of the Federal Council is, first, to express the fellowship and catholic unity of the Christian Church; second, to bring the Christian bodies of America in united service; third, to encourage devotional fellowship and mutual counsel concerning the spiritual life and religious activity of the churches; fourth, to secure a larger combined influence for the churches of Christ in all matters affecting the moral and social conditions of the people so as to promote the application of the law of Christ in every relation of human life; fifth, to assist in the organization of local branches of the Council and to promote its aims in their committees. The Federal Council has no authority over the constituent bodies adhering to it, but its province is limited to the expression of its counsel and the recommending of a course of action in matters of common interest to churches, local councils and individual Christians.

The following Christian bodies are represented in the Federal Council: Baptist Churches (North), Free Baptist Churches, Negro Baptist Churches, Christian Connection,

Congregational Churches, Disciples of Christ, Evangelical Association, Evangelical Synod, Friends, Evangelical Lutheran Church, General Synod, Methodist Episcopal Church, Methodist Episcopal Church (South), Primitive Methodist Church, Colored Methodist Episcopal Church of America, Methodist Protestant Church, African Methodist Episcopal Church, African Methodist Episcopal Zion Church, Mennonite Church, Moravian Church, Presbyterian Church in the U. S. A., Cumberland Presbyterian Church, Welsh Presbyterian Church, Reformed Presbyterian Church, United Presbyterian Church, Protestant Episcopal Church, Reformed Church in America, Reformed Church in the U. S. A., Reformed Episcopal Church, Seventh Day Baptist Churches, United Brethren in Christ, United Evangelical Church.

The first meeting of the Federal Council was held in Philadelphia, Dec. 2-8, and it was one of the most notable gatherings assembled in the religious history of the country. Delegates were present representing officially 18,000,000 of people, and indirectly some millions more. Over thirty Protestant denominations were represented. Bishop E. R. Hendrix of the Methodist Episcopal Church, South, was chosen president of the Council. Notable addresses were made on the subject of missions by Dr. Barton of the Congregational Board; Dr. Lloyd of the Episcopal Board, and Mr. Robert Speer of the Presbyterian Board of Foreign Missions. Probably the most important action of the Council was the adoption of resolutions concerning the relation of the Church to modern industry, and in fact to the whole social order of the day. These resolutions consist of two general divisions with a supplementary conclusion. In passing these resolutions the Council affirmed the faith of the Church in the teachings and authority of Jesus Christ as a solution of the problems of modern industry. It recognized the complexity of modern industrial conditions and counseled tolerance. It asserted that the mere organization of capital or labor does not determine right and wrong and that the Church must emphasize the Gospel as a test of both individual and collective conduct. It commended those employers who have shown in the conduct of their business a fraternal spirit, and a disposition to deal justly and humanely with their employees as to wages, profit-sharing, welfare work, etc., and of such labor organizations as have, under wise leadership, for so many years promoted the welfare not only of men of their own craft, but of the entire body of workingmen.

The resolutions declared for certain specific measures. Among these are the principles of conciliation and arbitration in industrial discussions, the protection of the worker from dangerous machinery, occupational diseases, injuries, and mortality, the abolition of child labor, the suppression of the sweating system, the gradual and reasonable reduction of the hours of labor to the lowest practicable point, the release from employment one day in seven, a living wage as a minimum in every industry, and the highest wage that each industry can afford, the most equitable division of the products of industry that can ultimately be devised, for suitable provision for the old age of the workers and those incapacitated by injury.

On Dec. 6 there was held a great meeting at which some thirty trade unions were officially represented by hundreds of workmen, and over which presided Dennis Hayes, President of the Glass Bottle Blowers of the United States, a Roman Catholic.

The officers of the Executive Committee of the Council are, Chairman, William H. Roberts, D. D.; Secretary, E. B. Sanford, D.D.

FEDERATED MALAY STATES. A British protectorate on the Malay Peninsula, comprising the native States of Perak, Selangor, and Negri Sembilan, on the west coast, and Pahang, on the east coast. Their approximate areas, and estimated populations at the end of 1906 are shown in the following:

	Area, sq. miles	Population, 1906
Perak	6,580	418,000
Selangor	3,200	283,619
Negri Sembilan...	2,600	121,763
Pahang	14,000	100,000
Total	26,380	918,400

In 1901 the population numbered 678,595 (189,508 females), including 312,486 Malays, 299,739 Chinese, 58,211 East Indians, 1422 Europeans, and 1522 Eurasians. The largest town is Kuala Lumpur, in Selangor, 35,000 inhabitants. In 1906 there were 285 English and vernacular schools, with 16,946 pupils. An Institute of Medical Research has been established at Kuala Lumpur.

AGRICULTURE. The areas under cultivation, exclusive of land under paddy, in the several States at the end of 1907 were as follows: Perak, 114,969 acres; Selangor, 92,072; Negri Sembilan, 38,299; Pahang, 16,423; total, 261,763 acres. Of this total, 112,560 acres were devoted to cocoanut cultivation, 126,235 to rubber, 10,833 to coffee, and 12,135 to other crops. The area under paddy was estimated at 107,143 acres. The land under rubber in the several States was as follows, in acres: Perak, 46,167; Selangor, 61,552; Negri Sembilan, 17,656; Pahang, 860. The number of rubber estates was 287; the number of trees, nearly 20,000,000; additions to the area in 1907 aggregated 40,473 acres. The total quantity of cultivated rubber exported in 1907 was 1,984,285 pounds (in 1906: 1,028,792 pounds), to which Perak contributed 1,198,751 pounds; Selangor, 255,530; Negri Sembilan, 530,004; Pahang, none. To the area under cocoanuts, 7500 acres were added during the year, of which only 650 acres were planted by Europeans. The total value of the cocoanut plantations was estimated at 22,000,000 dollars. The export of copra in 1907 was 55,421 piculs (of 133 1/3 lbs. each). The total number of estate laborers in 1907 was 58,073, of whom 43,824 were Tamils, 6029 Javanese, 5348 Chinese, and 2872 Malays.

MINING. The Federated Malay States supply 60 per cent. of the world's tin production. The total output of tin in 1907 was 813,636 piculs (of 133 1/3 lbs. each), 3150 piculs less than in 1906, to which Perak contributed 431,386 piculs; Selangor, 273,900; Negri Sembilan, 75,155; Pahang, 33,195. Taking the dollar at 2s. 4d., the sterling value of the output in 1907 was estimated at £8,095,134. The fluctuation in price was exceptionally great during 1907. Local prices reached a maximum of 97.24 dollars a picul in April and remained fairly high till the

end of August, when they began to drop, reaching their lowest point, 57.75 dollars, during December. The prices in the London market varied from £199 10s. a ton in July to £119 in December. The export of tin in 1907 was 13,938 tons, and of tin ore, 34,494 tons, against 18,259 and 30,358 respectively in 1906. The export of gold in 1907 was 15,353 ounces, valued at 526,388 dollars (£61,412), of which 14,286 ounces came from Raub. The mining revenue from all sources in 1907 was 10,027,262 dollars, showing a decrease of 561,562 dollars from 1906, due to lower prices for tin and to the keeping back of part of the tin stocks for higher prices. The mining revenue collected in the several States in 1907 was as follows: Perak, 5,351,774 dollars; Selangor, 3,455,241; Negri Sembilan, 931,369; Pahang, 288,878.

FOREIGN COMMERCE. The imports and exports, excluding bullion and specie, of the several States in 1907 were as follows, in dollars of about 56 cents each:

	Exports	Imports
Perak	24,825,278	40,031,564
Selangor	22,122,897	28,489,602
Negri Sembilan	4,071,870	8,938,905
Pahang	1,522,232	3,133,105
Totals	52,542,277	80,593,196

In 1906 the imports and exports totalled 50,926,606 and 80,832,325 dollars respectively. The principal imports are rice, flour, bran, sugar, kerosene oil, and opium. The principal exports are paddy, tin, sugar, tapioca, gambier, coffee, rubber, and copra. In the first eight months of 1908 exports of tin showed heavy decreases to all countries, except Great Britain, to which the exports increased to such an extent as to overcome the decreases to other countries. As regards other products, some showed increased exports, while others showed decreases.

COMMUNICATIONS. There are over 1860 miles of roads and 1280 miles of telegraph line. The Johore (q. v.) State Railway was expected to be completed by 1908, thus establishing railway communication between Prai, on the mainland opposite Penang, and Singapore, the only interruption in this distance of 493 miles being the Johore Strait, about three-quarters of a mile in width, to be crossed by a wagon-ferry. Progress was made in 1908 with the light railway from Ipoh to Tronoh, some 15 miles, in the most important tin-mining district of Perak. A beginning was also made in railway construction on the east side of the Peninsula, from Gemas, on the Johore border, to Kuala Semantan, the point in Pahang where the Semantan River falls into the Pahang River, a distance of 70 miles.

GOVERNMENT AND FINANCE. The highest authorities are the High Commissioner, who is the Governor of the Straits Settlements (q. v.), and the Resident-General at Kuala Lumpur—in 1908 Sir Wm. Taylor. There is also a subordinate resident in each State. The highest authority in each State is a Council composed of the native sultan, the resident and his secretary, and some of the leading Malay chiefs and Chinese merchants. There is a military force of 900 Sikhs and Pathans, and a police force of 2800 men, partly Malay and partly Indian. The revenue and expenditure in 1907 were 28,793,744

(about one-half from customs) and 20,225,992 dollars respectively.

FEEDING STUFF. See STOCK RAISING.

FENCING. The fifteenth annual intercollegiate tournament was won by West Point, the final point score being West Point, 22; Annapolis, 21; Cornell, 15; Columbia, 15; Yale, 7; Massachusetts Institute of Technology, 1. West Point defeated Pennsylvania 7 to 2, Columbia 6 to 3, and Harvard 9 to 0; Pennsylvania defeated Yale 7 to 6 and was defeated by Columbia 4 to 5; Annapolis defeated Columbia 5 to 4. In a triangular meet Columbia defeated Pennsylvania 8 to 1; Yale defeated Columbia 5 to 4 and Pennsylvania 9 to 0. In another triangular meet Annapolis scored 16 points, Cornell 7, and Pennsylvania 4. At the national championships, the duelling swords were won by P. Benzenberg of the New York Turn-Verein; the foils, by W. L. Bowman of the N. Y. A. C.; the sabres, by G. W. Postgate of the New York Turn-Verein. The Saltus cup and medals were won by the Fencers' Club of New York, the team being made up of C. Tatham, G. W. Breed, and W. S. O'Connor.

FENOLLOSA, ERNEST FRANCISCO. An American educator and writer, died on Sept. 25, 1908. He was born at Salem, Mass., on Feb. 18, 1853, and in 1874 graduated at Harvard, where he won the highest honors in philosophy. He was in Japan from 1878 to 1890, during which time he was connected with Tokio University as professor of philosophy and political economy, and of philosophy and logic (1880-86), and with the Tokio Fine Arts Academy as professor of aesthetics and manager. He was also for a time imperial fine arts commissioner of Japan and manager of the Imperial Museum at Tokio. Upon his return to the United States in 1890 he accepted the position of curator of the Oriental art department in the Museum of Fine Arts at Boston, where he remained for six years. In 1897 he returned to Japan and for three years held the chair of English literature at the Imperial Normal School at Tokio. He wrote two volumes of poems, *East and West*; *The Discovery of America and Other Poems* (1893); and *An Outline History of the Ukiyo-ye* (1902). He was also well known as a lecturer on Oriental topics. In 1886 the Mikado decorated Professor Fenollosa with the fourth class "Rising Sun" and in 1890 with the third class "Rising Sun" and the third class "Sacred Mirror."

FERDINAND I. Tsar of the Bulgarians, proclaimed on Oct. 5, 1908. He was born in Nerina on Feb. 26, 1861, the youngest son of Prince Augustus of Saxe-Coburg-Gotha. After the abdication of Prince Alexander of Bulgaria in 1886, Ferdinand was elected Prince by the National Assembly on July 7, 1887. His reign has been marked by the rapid economic development of the country, due largely during its first ten years to the ability of his minister, Stambuloff. Taking advantage of the Turkish revolution in 1908 and, it is supposed, encouraged by Austria, Bulgaria repudiated its nominal allegiance to the Ottoman Empire and proclaimed its independence, Ferdinand taking the title of Tsar. His heir is his son, Boris, born in 1894. See BULGARIA.

FERDINAND IV. Archduke of Austria, and Grand Duke of Tuscany, died on Jan. 17, 1908. He was born in Florence on June 10,

1835, a son of Leopold II, and of Maria Antonia, daughter of Francis I, King of the two Sicilies. Upon the abdication of his father (July 21, 1859) Ferdinand succeeded his grandfather, Ferdinand III. This succession was recognized by European courts, but on Aug. 16, the city of Florence and the Tuscan municipalities voted to dethrone the Hapsburg-Lorraine dynasty, and to incorporate Tuscany in the Kingdom of Sardinia, and this incorporation was made effective by decree of Victor Emmanuel, in March, 1860. Ferdinand lacked the power to make good his protest against this decree, and was constrained, therefore, to accept the Emperor Francis Joseph's offer of the Castle of Salzburg, where he lived most of his life. During his last years he was much humiliated and embittered by the extravagant conduct of his son, who was known as "Leopold Wölfling," and the escapades of his daughter, the Countess Montignoso, divorced wife of the King of Saxony, who, in 1907, married the musician, Toselli.

FERGUSON, ARTHUR WALSH. Executive secretary of the United States Philippine Commission, died at Manila, P. I., on Jan. 29, 1908. He was born in Benicia, Solano County, Cal., on Dec. 4, 1859, and lived during his youth in Mexico, where he laid the foundation of his fine knowledge of the Spanish language. He graduated at St. Augustine College (Benicia) in 1877, and at the Law School of Georgetown University in 1885. In 1879-82 he was owner and editor of the Benicia *New Era*, a weekly newspaper. He was appointed interpreter to the International American Conference, which met at Washington in 1889, and thereafter was secretary of the International American Monetary Commission (1891); official interpreter to the Intercontinental Railway Commission (1891); secretary to the United States Chilean Claims Commission (1893); secretary to the United States and Venezuelan Claims Commission (1894); chief translator to the Bureau of American Republics (1897-1900); official interpreter to the American and Spanish Peace Commission, at Paris (1898); Spanish secretary to the United States Philippine Commission (1900); chief secretary of that body (1900-1901), and from July 16, 1901, executive secretary for the Commission.

FERREIRA DO AMARAL, FRANCISCO JOAO. A Portuguese admiral and statesman, became Prime Minister of Portugal on Feb. 3, 1908, immediately after the accession of Manoel II. The assassination of King Carlos had been caused in part by the dissatisfaction of the politicians with reforms of his prime minister Franco, and Amaral immediately reversed his policy, reestablished the freedom of the press and ordered elections for the Cortes to be held on April 5, 1908. See PORTUGAL.

FERRERO, GUGLIELMO. An Italian historian, who visited the United States in 1908, delivering lectures at several universities and contributing various discussions and criticism in the press and magazines. He was born in 1871, at Portici, near Naples, the son of a Piedmontese railway engineer, and received his early education in Tuscany and Umbria. After the study of law at Pisa he received a diploma in belles-lettres at Bologna, where he studied under the great Italian poet, Carducci. He collaborated with Lombroso, whose daughter he subsequently married, in his work, *The Female Offender*, and after the publication of his doctor's thesis, which was translated immediately into French, Ferrero was in active demand as

a contributor to various periodicals and newspapers. In 1902 appeared the first volume of his history, *Greatness and Decline of Rome*, which immediately secured him recognition as a historian. Five volumes of this work had appeared up to 1908 and four more were announced. Signor Ferrero's work throws new light on Roman history, largely due to his point of view, and he has been very keen in finding analogies with modern conditions in the life of the great Republic. His work has aroused criticism as well as approval.

FERTILIZERS. The year 1908 was characterized by substantial progress in the extension of production and consumption of fertilizers, rather than by any striking discoveries relating to the fertilizer industry. The tendency to concentrate the fertilizer business in the hands of a few large corporations was evident in 1908, as in previous years. While fertilizers were used in larger amounts, it was evident that they were used with greater discrimination and intelligence than ever before. This can be traced directly to the influence of the various educational agencies, which have been so active in recent years in teaching the applications of science to agriculture. Scientific investigation was directed during the year more particularly toward perfecting our knowledge of the means by which the nitrogen of the air may be made commercially available. Notable progress was reported in perfecting methods and in establishing factories for the manufacture of basic lime nitrate by the Birkeland and Eyde process and of calcium cyanamid by the Frank and Caro process. Both of these processes utilize the free nitrogen of the air. Several new factories for the manufacture of the products were completed and others begun in Europe during the year. and an American branch of the Cyanamid Company, having headquarters in New York City, began the construction of works at Niagara Falls, Ontario. The products found their way to a limited extent into the European markets, and their fertilizing value was tested with satisfactory results with many different kinds of crops, and under a great variety of conditions. The activity in the manufacture of these products awakened renewed interest in the two principal nitrogenous fertilizers—nitrate of soda and sulphate of ammonia—with which the new materials must compete.

The total production of Chilean nitrate in 1908 was estimated at over 2,000,000 tons, indicating a marked increase over the production of 1907. More careful inquiry into methods of exploitation, and of preparing the nitrate for the market indicated that predictions of the early exhaustion of the natural supplies of nitrate were not well-founded. Müntz and Nottin, in France, have worked out methods of preparing and operating nitre beds of peat, which are capable of yielding large quantities of nitrate by rapid nitrification. Progress was also made during the year in perfecting and applying processes for securing larger supplies of ammonium compounds from peat and from the fumes escaping from coke ovens and gas furnaces. Little or no progress was recorded during the year in regard to the inoculation of seeds and soils to secure greater assimilation of the nitrogen of the air by leguminous plants.

The direct fixation of the free nitrogen of the air by certain soil microorganisms received much attention, but this matter still in the

main remained in the field of purely scientific inquiry. Incidentally, however, these investigations furnished additional evidence that the high fertilizing value of barnyard manure is due in part, at least, to the fact that this material furnishes peculiarly suitable food and favorable conditions for the activities of beneficial soil organisms.

Collateral investigation showed that the large losses of nitrogen which occur in ordinary methods of handling barnyard manure may be greatly reduced by the simple means of making the bottom layer of the manure heaps of old, fermenting manure. In view of the rapid exploitation of the known available supply of phosphates in the United States, the large foreign exports, and the wide distribution in this country of farm lands needing phosphate, the President of the United States, with wise foresight, ordered, Dec. 10, 1908, the withdrawal from public entry of certain Western phosphate lands, comprising about 7,500 acres in portions of Morgan, Rich, and Cache counties, Utah, Bear Lake, Bannock, Bingham and Fremont counties, Idaho, and Uinta county, Wyoming, and constituting, according to preliminary surveys of the U. S. Geological Survey, "the greatest known phosphate deposit in the world." According to a report of the Survey, "there were 2,265,000 tons of phosphate rock produced in the United States in 1907, and of this amount 900,000 tons, or about 40 per cent., was exported. . . . At the present rate of mining the known available supply of high-grade phosphate rock in the United States will last only fifty-four years, and if the increase in production shown during the last decade continues the supply will be exhausted in twenty-five years. It is therefore evident that the large deposits of the public-land States must be depended on to replenish the fertility of the farms of the United States, and the only available method of preventing the acquisition of these phosphate deposits by foreign companies for shipment abroad and of insuring their use on our own lands is apparently to retain the title in the government and lease the lands under provisions that will prevent exportation.

FIJI ISLANDS. A group of about 250 islands in the South Pacific Ocean, about 80 of which are inhabited, forming a British crown colony. Area, 7435 square miles. Viti Levu, the largest island, covers 4250 square miles. Population (1901), 120,124, including 2459 Europeans, 17,105 East Indians, 94,397 Fijians, 2230 Rotumans, and 1983 Polynesians and mixed; on Dec. 31, 1906, 125,085. Suva, the capital, on Viti Levu, had 1121 inhabitants in 1906. No systematic attempt has yet been made to prospect for minerals, though traces of gold have been found on the islands of Viti Levu and Vanna Levu, and it is believed that copper exists on both of these islands. The cultivation of sugar-cane, cocoanuts, and green fruits, chiefly bananas, is the staple industry. The total area under cane in 1907 was estimated at 39,404 acres, from which 584,686 tons of sugar-cane were produced. There are six sugar mills, of which four are owned by an Australian concern. The output of sugar rose from 40,000 tons in 1906-7 to 68,000 tons in 1907-8, and 80,000 tons in 1908-9. The area under cocoanuts cultivated by Europeans is estimated at 28,634 acres; of that cultivated by natives, there are no returns. The quantity of copra—the dried kernels of the coconut—exported in 1907 was 11,200 tons

valued at £182,788. The area under bananas and pineapples, exclusive of native cultivation, was 3477 acres. The natives cultivate considerable banana areas, selling the produce to European agents. A considerable improvement in the quality of fruit exported has resulted from the appointment in 1907 of an inspector of fruit for export. Experiments with rubber cultivation have proved successful. Other products are maize, rice, yams, peanuts, tobacco and tea. The imports and exports in 1907 amounted to £643,007 and £881,364 respectively. The trade is mainly with Australia and New Zealand. The administration is in the hands of a Governor, in 1908, Sir Everard F. im Thurn, who is also High Commissioner for the Western Pacific. In 1907, the revenue was £179,802; the expenditure, £156,811; the public debt, £133,915, including £55,815 to the Imperial government, bearing no interest.

FILTRATION. See WATER WORKS.

FINANCIAL REVIEW. The year 1908 was an after-panic year. It opened with business at a low ebb in both financial and industrial circles, and recession continued until March. New York City banks began with currency at a premium, and call money reaching 20 per cent., while the Clearing House banks showed a deficit of \$20,170,000 in reserves against deposits and had outstanding more than \$50,000,000 Clearing House certificates. Industry steadily slackened during the early months. The number of idle freight cars increased from 114,819, Dec. 11, 1907, to 413,338, April 29, 1908; the demand in the retail trade fell off, in spite of sharp reductions in commodity prices until June; factories were running on short time, or closed; and unemployment was on the increase. There was, however, a very rapid recovery in financial quarters. By Feb. 1, the New York banks reported surplus reserves of \$40,526,000; practically all the Clearing House certificates were retired during February; the average rate of money on call fell from 15 per cent. in the early days of January to 1½ per cent. early in February, which rate was the average for the remainder of the year. The January dividends, increased by millions of new circulation (see CURRENCY) and other millions restored to banks by returning confidence, piled up cash holdings to an unprecedented level, especially in New York City, and stimulated investment. The demand for bonds was one of the features of the year on the New York exchange, the sales establishing a new high record. Prices of stocks recovered with remarkable rapidity and new issues were large (see below). Many railroads reduced dividends, among them the Pennsylvania, the New York Central and the Atchison roads, while many others, including the Missouri Pacific, were compelled to omit dividends. No less than 24 railroads went into receiverships, including the Seaboard Air Line, and the Cincinnati, Hamilton and Dayton. Building fell off, commodity prices reached their lowest level June 1, while the bank clearings for the first six months were the smallest in four years, and failures were 58 per cent. more numerous than in 1907.

On June 27, New York banks reported \$66,000,000 surplus cash reserves, an amount surpassed only in 1894. During the second half year money continued easy, though in December, the call rate advanced occasionally to 4 per cent. The rate of six months money, which

stood at 6 per cent. in January, fell gradually to 4 per cent. in April and to 3¼ per cent. in June; it remained at or slightly above this rate during the remainder of the year. With prospects of good crops and increasing optimism and confidence, bank clearings began to increase and in September passed the 1907 level. The presidential campaign and the exposure of certain letters from John D. Archbold, of the Standard Oil Company (q. v.) led to some uneasiness in the stock market in October. It was on the 30th of the month, however, that the number of idle freight cars fell to 100,073, the year's minimum. There was a noticeable revival following the election of Wm. H. Taft. This was furthered by the splendid grain, hay and cotton crops, with high prices for all farm products. Building increased in November, bank clearings reached the year's maximum, and railway earnings were good. During December, there was a slight reaction, and signs of a growing conservatism. During the later months, the situation in the railway world was very much improved. By vigorously reducing expenses, and by foregoing all improvements, many roads brought net earnings up to the 1907 level; in some cases, both gross and net earnings in October, November and December exceeded those for the closing months of 1907. However, the number of idle freight cars increased rapidly after December 1. The consumption of goods as shown by the retail trade rose from the 35 per cent. of normal for January to 75 per cent. of normal in December. This reacted on manufacturing establishments. Blast furnaces, idle since February, in Pennsylvania, Ohio and Alabama, were blown in early in October; cotton and woolen mills started; railway shops all opened on part or full time before November. Most establishments were running at from 60 per cent. to 75 per cent. of capacity at the close of the year. This brought the total volume of industry fully up to the 1905 level.

GOLD EXPORTS began in April, and reached a total of \$73,000,000 by the close of the year; the net exportation of gold was \$45,000,000. This represented only a portion of the gold imported in November and December, 1907, and, in view of the recovery of bank reserves, the movement, though the largest net export in thirteen years, caused no disturbance. The year's statistical record shows some new maximums, and compares not unfavorably with previous years. The value of farm products was estimated by the Secretary of Agriculture at \$7,778,000,000, an amount never before attained, it being 3.8 per cent. larger than the value in 1907. Bank clearings were only 9 per cent. less than in 1907, and exceeded those of any year preceding 1905. (See CLEARING HOUSE.) Stock and bond transactions exceeded those of 1907 (see below). The country's pig-iron production was only about 15,936,000 tons, or 38 per cent. less than the record output of 1907, and smaller than any year's total since 1901. After June, the pig-iron production increased each month, the December output of 1,740,000 tons being 70 per cent. larger than that of January. Iron-ore shipments of 25,427,000 tons were 37 per cent. less than those of 1907. The output of rails was only 1,800,000 tons, or only one-half that of 1907. Copper production was abnormally low in the early months of the year, but exceeded the normal in the later months. This was due to a heavy export trade. It was due also in part to a marked revival in the brass and electrical in-

dustries in the latter half of the year. Labor troubles were not numerous, in spite of a bad labor market; strikers numbered only 230,000, as compared with 330,000 in 1907 and 650,000 in 1903. The volume of foreign trade was 15 per cent. less than the high record established in 1907, but the exports, valued at about \$1,724,000,000, surpassed those of any year preceding 1906, and the imports, valued at about \$1,104,000,000, surpassed those of any year preceding 1905. The decrease in the value of both exports and imports was due in large part to lower prices instead of smaller quantities. Traffic on the Great Lakes was 29 per cent. less in quantity than in 1907. There was also a sharp decline in the earnings of transatlantic steamships. The business of the United States Steel Corporation is generally viewed as a good trade barometer. Its net profits in 1908 were \$92,000,000, as compared with \$161,000,000 in 1907 and \$156,600,000 in 1906. The largest net earnings were made in October, the last two months of the year showing some recession in business. However, the unfilled orders on Dec. 31 were larger than at any time since Mar. 31, though less than one-half those of June 30, 1907. The total gross earnings of 229,000 miles of railway were estimated at \$2,330,250,000 for 1908, or 11 per cent. less than for 1907; and net earnings at \$763,550,000, or 14 per cent. less than for 1907. While total gross earnings were \$315,300,000 less than in 1907, total expenses also were \$226,300,000 less. As reported by *Bradstreet's*, the aggregate expenditures for building in 83 cities in the United States were \$591,191,000, or ten per cent. less than in 1907; this decrease, however, was entirely due to the enormous decline of the first months of the year, as there was a steady improvement throughout. The world's gold production in 1908 was \$438,000,000, or \$118,000,000 more than in 1907, a fact that argued well for the rapid recovery of the world's industrial condition.

STOCKS AND BONDS. The year, like preceding post-panic years was remarkable for the amount of money seeking investment. The result was a good market for securities. While 1907 and 1906 had been years of money scarcity, with the result that bond sales were difficult and great quantities of short time notes were issued at high rates of interest, the year 1908 saw the ready absorption of unprecedented quantities of bonds at the remarkably low rates of $3\frac{1}{2}$ per cent. to $4\frac{1}{2}$ per cent. The bond sales of the New York Stock Exchange aggregated \$1,084,507,500 par value, as compared with \$529,861,919 in 1907. This new maximum was approached only in 1901, 1904, and 1905. Of the total, \$1,002,730,700 were listed railroad and miscellaneous bonds, \$10,148,820 government bonds, \$64,362,500 city bonds, and \$1,775,000 state bonds. The sales of November and December were enormous, those of November being \$136,605,000 and those of December, \$165,669,000. The sales for the second half of the year were 62 per cent. of the year's total. The stock transactions on the New York exchange amounted to 196,821,875 shares, as compared to 195,445,421 shares in 1907, and to the record maximum of 284,016,894 shares in 1906. May, August, November, and December were the months of heaviest trading. The Boston exchange showed a somewhat similar record. The bond sales of the year, \$39,828,000, reached a total more than five times that of 1907, and never before ap-

proached. The stock transactions, 13,002,000 shares, were slightly less than those of 1907.

RISE IN VALUES. The effect of abundant money and confidence on the part of investors showed itself in the remarkable advances in the value of stocks. The total appreciation in the value of 95 railroad stocks, shown by comparing the stock quotations for Dec. 31, 1907, and the same date, 1908, was \$1,413,096,211; and the appreciation of 92 industrials was \$834,169,000.

A computation by *The Wall Street Journal* showed that the average price of 20 typical railroad stocks was lowest on Feb. 17, with a value of 86.04, and highest on Dec. 12, with a value of 118.18. The lowest average for these stocks in 1907 (Nov. 21) was 81.41; in 1906, 120.30; and in 1905, 114.52; and their highest average price in 1907 (Jan. 5) was 131.95; in 1906, 138.39; and in 1905, 133.54. The lowest average for twelve industrials in 1908 was 58.02 on Feb. 13, and their highest, 88.38, on Nov. 13. Their lowest in 1907 (Nov. 15) was 53; in 1906, 85.18; and in 1905, 71.37; and their highest in 1907 (Jan. 7), 96.37; in 1906, 103; and in 1905, 96.56. Taking all railroads, the average of closing prices at the end of 1908 was 120.05, as against 89.50 at the end of 1907; and for industrials, 86.15 as against 59.47 for 1907.

ISSUES OF SECURITIES. The excellent securities market resulted in very large issues of both stocks and bonds by corporations. The total amount of issues authorized during the year was, according to *The Journal of Commerce and Commercial Bulletin*, \$2,189,958,000, and the amount actually issued was \$1,419,799,000. This exceeded the amount issued in 1908 by \$26,000,000. The total issues by railroads aggregated \$990,715,000, including \$595,113,000 bonds, \$274,705,000 notes, and \$120,896,000 stocks. The issues by industrial companies amounted to \$429,083,000, including \$197,850,000 bonds, \$26,850,000 notes, and \$204,383,000 stocks. The bond issues aggregated \$792,963,000, the notes \$335,697,000, and the stocks, \$325,279,900. Not all of these vast sums represent new additions to capital, for it was estimated that fully one-third of the total was of bonds issued for the purpose of refunding older ones maturing during the year or soon thereafter. The most notable bond issue of the year was the sale of \$40,000,000 of 4 per cent. consolidated mortgage bonds by the Pennsylvania Railroad. They were sold at 96, were oversubscribed for twenty times, and sold at 103 at the end of the year.

The foregoing issues do not include State and municipal bonds, which found an ever better market as the year advanced. New York City sold bonds in February at a price yielding 4.3 per cent., and in November at a price yielding 3.89 per cent. New York State bonds sold in March so as to yield 3.7 per cent., and in December so as to yield 3.5 per cent. The February sale of New York City bonds was in amount \$50,000,000 par value, the largest sale of city bonds ever made at any time and place. It was oversubscribed six times. Similarly, the sale of \$12,000,000 of bonds by the city in December was oversubscribed twelve times. The sale of \$30,000,000 Panama bonds in December by Secretary Cortelyou was very successful.

INVESTIGATIONS. On December 15, Governor Hughes, of New York, appointed a committee to investigate dealings on the stock and commodity exchanges in New York City. The committee,

representing a wide variety of talent and experience, consisted of Horace White, author and financial editor, Chairman; John B. Clark, economist; Willard V. King, banker; Edward H. Page, wholesale dealer; Clark Williams, State Superintendent of Banking; Ex-justice David Leventritt; Chas. A. Schieren, merchant; Samuel H. Ordway, lawyer; and Chas. S. Smith, director of the People's Institute. The committee determined upon a policy of secrecy with reference to results of its inquiries until its report was ready for submission to the Governor.

NEW CORPORATIONS. The new incorporations during the year were fewer than in 1907. The aggregate par value of the authorized capital of new concerns, with at least \$1,000,000 authorized capital, in the Eastern and New England States was \$1,251,197,000. This was 14 per cent. less than in 1907 and not much more than half the total for 1906. The incorporations of large concerns in all other States totaled \$310,955,000 authorized capital, or 40 per cent. less than in 1907; and the total capital of concerns in all states with more than \$100,000 and less than \$1,000,000 authorized capital was \$497,931,000. During the early part of the year there was great hesitation about forming new companies, but as the confidence of investors returned and business increased, the number and amount of new incorporations increased, reaching 50 per cent. of normal for the past eight years by August and 5 per cent. of normal by the end of the year.

The leading concerns chartered during the year and their authorized capital were as follows: The International Smelting and Refining Company, \$50,000,000; the Independent Fertilizer Company, \$50,000,000; the Phelps and Dodge Company, \$50,000,000; the United States Light and Heating Company, \$17,500,000; the American Piano Company, \$12,000,000; the National Silk Dyeing Company, \$10,000,000; the Tennessee Chemical and Fertilizer Company, \$10,000,000; the Corn Products Refining Company, a consolidation of the Corn Products Company and the old Corn Products Refining Company, \$80,000,000; the American Steel Foundry Company, a new incorporation of an old concern, \$17,184,000; the Atlantic, Gulf and West Indies Steamship Lines, the successor to the Consolidated Steamship Company, \$40,000,000; the Cerro De Pasco Copper Company, \$60,000,000; the American Railways Company, incorporated at Pierre, S. D., \$150,000,000, its object being to build a road from Chicago to Winnipeg.

The incorporations were distributed among principal states as follows: New Jersey, \$475,330,000; Maine, \$339,325,000; Delaware, \$226,420,000; New York, \$149,882,000; and Illinois, \$89,605,000.

FAILURES. (a) *Commercial.* The number of business failures in the United States in 1908 as reported by *Bradstreet's* was 14,066, as compared with 10,258 in 1907 and 9,384 in 1906. Only in 1893 and 1896 has this number been exceeded. The total assets of failures in 1908 were \$167,807,000 and total liabilities \$296,486,000, as compared with \$287,814,000 and \$384,057,000 respectively in 1907. Thus the total of liabilities of failures was much smaller in 1908 than in 1907, but the ratio of assets to liabilities was also smaller, 56 per cent. in 1908 and 75 per cent. in 1907. While the majority of the failures in 1908 were small ones, there were 320 with liabilities of \$100,-

000 or more, as compared with 327 in 1907, the aggregate liabilities of such failures being 60 per cent. of the total in 1908, and 75 per cent. in 1907. This large percentage in 1907 was due to the fact that fully \$125,000,000 of liabilities included in the total for that year were those of large firms which suspended in October and later resumed business without becoming insolvent. This fact also accounts for the high ratio of assets to liabilities in 1907, a ratio probably never before equalled; this ratio in 1908 (56 per cent.) exceeded that of every other year since 1896. By groups of States the number of failures and the total liabilities were as follows: New England, 1,333, \$18,076,000; Middle, 4,806, \$150,395,000; Western, 2,456, \$52,574,000; Northwestern, 768, \$16,190,000; Southern, 3,467, \$43,250,000; Far-Western, 1,197, \$15,532,000; Territories, 39, \$467,000. This grouping of States is peculiar: *Middle* includes New York, New Jersey, Pennsylvania, and Delaware; *Southern* includes the 13 Southern States, Oklahoma, and the District of Columbia; *Western* includes Ohio, Indiana, Illinois, Michigan, Kentucky, Missouri, Kansas, and Colorado; *Northwestern* includes eight, and the *Far-Western* six States. Every division showed an increase in the number of failures in 1908 over 1907, while all but the Western and Northwestern States showed decreases in total liabilities. This decrease in New England was 57.5 per cent. and in the Middle States 26.2 per cent. The number of failures in New York City in 1908 was 2,071 and the liabilities, \$97,747,000, an increase of 46.6 per cent. in the number but a decrease of 23.4 per cent. in the liabilities as compared with 1907.

The distribution of failures by industries, for the year ending Nov. 30, according to *Dun's Review* was as follows, with liabilities in each case: Manufacturing, 3,852, \$111,723,000; trading, 11,328, \$91,684,000; brokers and transporters, 609, \$41,065,000; banking, 207, \$152,493,000. The greatest amounts of liabilities were charged against manufacturers of machinery and tools, and lumber, and millers; and against general stores and dealers in meat and groceries.

(b) *Financial.* The record published by *Bradstreet's* showed that there were 132 failures or suspensions of national, State, and private banks, and loan and trust companies, with aggregate assets of \$66,735,000 and aggregate liabilities of \$93,525,000. Though bank failures were less than 1 per cent. of the year's total number, they furnished 31 per cent. of the total liabilities. In 1907 failures and suspensions numbered 89, assets were \$188,464,000 and liabilities \$206,266,000. Many of these banks later resumed payments, but the effect of a bank suspension on business is comparable to the effect of a failure. This fact is of special significance owing to the fact that financial failures and suspensions of 1907, most of them occurring in the later months, accounted for 54 per cent. of all liabilities of failing concerns in that year. Thus it appears that the break in prosperity late in 1907 was distinctly a financial collapse. The number of bank failures in 1908 greatly exceeded the number in 1907, and was only exceeded in 1893, 1895 and 1896. The liabilities, however, were less than half those of 1907, and little more than half those of 1893, though greater than those of any year between those two. Private banks furnished 41 per cent. of the number and 29 per cent. of the liabilities

of banking failures. Trust companies, which furnished 57 per cent. of the liabilities of bank failures in 1907, furnished only 13 per cent. in 1908. National banks furnished 19 per cent. of the liabilities in 1907 and 24 per cent. in 1908; and state banks furnished 9 per cent. in 1907 and 30 per cent. in 1908. The numbers of various kinds of banks failing or suspending were: National, 18; State, 35; savings, 9; private, 55; loan and trust companies, 15. With reference to national banks liquidating in the year ending Oct. 31, 1908, the report of the Comptroller of the Currency stated that 7 were wrecked by the cashier, 1 by defalcation of officers, and 3 by fraudulent management; 6 failed because of excessive loans followed by depreciation of securities, 2 because of excessive loans to officers, 1 because of the failure of large debtors, and 1 because of general money stringency.

CANADA. The commercial failures in Canada in 1908 numbered 1,714, with total liabilities of \$17,586,000 and assets of \$7,844,000. Compared with 1907 the number of failures increased 25.5 per cent., the liabilities 50.2 per cent., and the assets 30.5 per cent. This comparison seems to indicate that the financial panic and business depression did not produce their effect in Canada until after the close of 1907, a condition the reverse of that in the United States.

GREAT BRITAIN. As in other principal financial centres, London experienced a marked change in the condition of the money market from stringency at the close of 1907 to abundance after the middle of 1908. There was a decrease in the demand for loans; a decrease in the retail trade and of necessary circulation; and a decrease in prices, which, however, recovered steadily during the later months of the year. Unlike bankers in New York, Berlin, and Paris, who accumulated unusual gold reserves, London bankers showed great confidence in making investments, the amount of English capital placed abroad probably exceeding that of any previous year. The Bank of England reserve did not for this reason increase materially during the year, nevertheless its discount rate fell from 7 per cent., the abnormally high in Nov., 1907, to the abnormally low, $2\frac{1}{2}$ per cent., a year later. The dullness in the stock market showed itself in a decline of \$800,000,000 in bank clearings on stock exchanges in 1908 as compared with 1907. Nevertheless, there was an average advance of 5 per cent. in the value of 387 selected securities dealt in on the London exchange, showing an aggregate advance of \$950,000,000 in value. It should be stated that more than half of this advance was credited to 33 American railway stocks. In international trade Great Britain suffered greater losses than the United States, Germany or France. Her total loss exceeded \$500,000,000, about equally divided between decreased imports and decreased exports. The year was notable for the severe depression in the iron and steel and ship-building industries, while textile mills experienced a quite marked decline in business. As a result unemployment (q. v.) reached an unprecedented extent, a condition giving a gloomy aspect to the industrial and trade situation at the close of the year.

FRANCE. France is the creditor of almost all nations. One effect of this condition was the accumulation of an enormous gold reserve by

the Bank of France, this reserve increasing by \$150,000,000 from Jan. 16 to Dec. 11, when it amounted to \$700,000,000, an amount never before equalled. The reason for this calling in of balances from all nations was stated to be the lack of confidence in the existing industrial and financial condition in England, Germany, and America, but was also closely connected with the political situation in Europe. The American crisis affected France less than did the depression in Germany. The German industries have secured capital from France, and will need more; the Balkan crisis and the Moroccan affair introduced a note of trepidation into international financing; Russia made preparations for borrowing \$250,000,000. All these facts caused French gold to remain temporarily idle. The demand in the home retail trade was about up to the normal level, but there was a noticeable decline in the production for export.

GERMANY. The year in Germany was one of moderate decline, but not of crisis. There was an unusual amount of unemployment (q. v.), as a result of slackness in various industries. But the general conservatism of bankers and business men prevented any collapse of business. This is shown by the fact that total railway receipts were only 1 per cent. less than in 1907, freight receipts being $3\frac{1}{2}$ per cent. less. The foreign trade of the first ten months showed imports 9 per cent. less and exports 2 per cent. greater than during the same period in 1907. The later months showed improvement in tone. The coal output was greater by 9,000,000 tons than that of 1907. The iron and steel trade however, showed considerable falling off, dividends of fourteen large companies being reduced from an average of 16 per cent. in 1907 to 12 per cent. in 1908. One of the causes of a bad year in smaller industries was the maintenance of high prices by the Steel Works Union (comparable to the United States Steel Corporation), and by the syndicate of coal companies. A sharp reduction in steel prices near the close of the year gave a decided stimulus to that and allied industries. As in the United States, the slackened trade and industrial conditions resulted in a considerable accumulation of cash capital which tended to stimulate business revival. The cash holdings of the Reichsbank were \$100,000,000 larger in Nov., 1908, than a year earlier. There was an advance also in the values of securities. This was due in part to the fact that in spite of the prosperity of 1907, financiers and investors had forced values down to the lowest possible point, so that no marked recession in values followed the Wall Street crisis in October. All bonds were quoted higher in Nov., 1908, than one year earlier. The stocks of the eight leading Berlin banks averaged 154.25 in Nov., 1908, as compared with 148.50 in Nov. 1907. Shares of iron and steel companies were one or two points less in 1908 than in 1907, and those of coal companies considerably less. There were slight decreases in the stocks of the Transatlantic Steamship Companies, of the large chemical concerns, and of textile companies, but slight advances in those of machinery, street railway, and electrical companies. With favorable price reductions in steel, and abundance of ready capital, German industries were awaiting the more complete revival of business in the United States before returning to fully normal conditions. One of

the unfavorable features of the financial situation is the demand by the Imperial treasury for new sources of revenue capable of supplying about \$110,000,000 annually, and the proposal to tax illuminating gas, electricity, and wines. If levied, these taxes will have considerable industrial effect.

FINLAND. A Grand Duchy, forming a part of the Russian Empire. Area, 144,255 square miles. Population on Dec. 31, 1906, 2,933,856. The movement of population in 1906 was as follows: 19,937 marriages, 91,401 births (excluding 2,317 still-births), 50,857 deaths, and 17,287 emigrants. The population of the principal cities in 1908 was: Helsingfors, (1907) the capital, 130,526; Abo, 45,102; Tammerfors, 42,577; Viborg, 32,648; Nikolaistad, 19,040; Uleaborg, 18,227; Björnborg, 16,521; Kuopio, 14,491. Including the Russian garrison and a floating population of 10,000, Helsingfors had 140,000 inhabitants at the end of 1906.

PRODUCTION. The principal crops are rye, barley, oats, and potatoes. Some wheat, flax, and hemp are also grown. At the end of 1905 there were 323,514 horses, 1,480,692 horned cattle, 937,565 sheep, 6,276 goats, 220,357 pigs, and 141,811 reindeer. The butter export in 1906 was 15,056 tons. The Crown forests covered in 1905 13,129,376 hectares (1 hectare = 2.47 acres). Timber is the largest item in the list of export values. In 1905 there were 189 saw-mills with water power and 400 with steam power, employing 21,640 workers, and turning out 2,864,222 cubic meters of timber. The production of iron ore in 1905 was 48,404 tons; pig iron, 22,407 tons; bar iron, 19,897 tons. Exclusive of flour mills, there were in 1905, 9,054 manufacturing establishments, employing 107,828 workers, and turning out a product valued at 392,544,700 marks (mark=franc=19.3 cents). The industries with the largest output are wood, iron and mechanical works, textiles, paper, leather, and chemicals.

COMMERCE AND COMMUNICATIONS. The imports and exports in 1907 amounted to 379,100,000 and 267,200,000 marks respectively, against 313,900,000 and 281,400,000 in 1906. The principal imports in 1907 were, in millions of marks: Cereals, 83.7; machinery, 25.6; iron and manufactures thereof, 22.1; minerals, 18.4; cotton, 14.6; coffee, 14.5; sugar, 12.8; chemicals and dyes, 11.9. The principal exports in 1907 were, in millions of marks: Timber, 139.5; paper and wood-pulp, 43.4; butter, 31.5; hides and skins, 7.3; fish, 5.3; iron, 4.8; wood manufactures, 3.5; cotton tissues, 2.4. The trade with the principal countries of origin and destination in 1907 was as follows, in millions of marks:

From and to	Imports	Exports
Russia.....	152.9	30.8
Germany.....	111.2	72.5
Great Britain.....	45.6	84.3
France.....	4.6	25.8
Denmark.....	26.8	8.5
Sweden and Norway.....	19.8	9.8

In 1907 the ports were entered by 8,571 ships of 2,490,578 tons (926,191 Finnish, 207,572 Russian), and cleared by 8,367 ships, of 2,471,366 tons (918,724 Finnish, 197,392 Russian). The merchant marine consisted on Jan. 1, 1908 of 393 steamers, of 60,784 tons, and 2,652 sailing

vessels, of 304,660 tons. The length of railway in Jan., 1908, was 2,072 miles, over nine-tenths being owned by the State. In April, 1907, the Swedish Parliament granted the money for a railway to the Finnish frontier, to be completed in three or four years. In Nov., 1908, the Finnish Senate assigned 2,500,000 rubles (1 ruble=51.5 cents) for connecting the Russian and Finnish Railway systems.

GOVERNMENT. The Emperor of Russia is Grand Duke of Finland. The old national Parliament, consisting of representatives of the nobles, clergy, burghers, and peasants, was abolished in 1907. The new unicameral Diet consists of 200 members, elected by direct and universal suffrage, without distinction of sex. Every citizen entitled to vote is eligible to the Diet. At the first election, in 1907, 22 women were elected as members of the Diet. Proportional representation is provided for. The Diet lasts for three years, unless sooner dissolved by the Grand Duke. The executive, at the head of which are the Russian Secretary of State for Finland and the Governor-General, is responsible to the Grand Duke as well as to the Diet. The Diet cannot change the fundamental laws, nor may it legislate in regard to land and sea defense. Finland is included in the St. Petersburg military district. The Governor-General in 1908 was Gen. W. A. Boeckmann.

FINANCE. In 1907 the revenue amounted to 134,382,249 marks, and the expenditure to 130,340,191 marks. The principal sources of revenue were: State lands and forests, 11,151,124 marks; railways, 39,594,833; direct taxes, 6,151,256; customs, 49,212,609; excise, 8,195,395; posts, 5,897,467. The principal items of expenditure were: Civil list, 375,900 marks; justice and prisons, 4,266,663; worship and public instruction, 12,267,922; communications, 40,733,484; military affairs, 180,501; public debt, 6,259,412. The public debt stood on Jan. 1, 1908, at 137,516,878 marks. For history during 1908, see RUSSIA.

FIRE INSURANCE. See INSURANCE.

FIRE PROTECTION, MUNICIPAL. The construction, extension, and test of high-pressure independent or auxiliary systems of water mains for fire protection was a striking feature of the year, 1908, as by many the completion of New York's high-pressure systems for the business district of Brooklyn and the downtown portion of Manhattan was considered to have marked an epoch in fire-fighting, and the increased use of the central high power pumping station to supplant or as auxiliary to the mobile fire engines furnished to the city much needed protection. So successful has the high-pressure system of Philadelphia, the first large system of auxiliary mains for fire purposes exclusively, proved, that during the year bonds to the amount of \$500,000 were issued for its extension in the northeast part of the city. In San Francisco the very complete scheme for a system of elevated storage reservoirs, distributing reservoirs, and a high-pressure distribution system developed in 1907 was duly approved, and bonds were issued to enable the work to be commenced.

In a number of other American cities high-pressure systems of greater or less size and capacity were either in operation or were contemplated and where such systems of independent mains are supplied by fire boats, there

Oliver Street Station, Borough of Manhattan**

HIGH PRESSURE FIRE SERVICE FOR NEW YORK CITY

Digitized by

476

was a movement to have independent stations of permanent character substituted. In New York centrifugal pumps direct connected to alternating current induction motors were used and current supplied by the Edison companies under the terms of yearly contracts, a fixed sum being paid for reservation of power and a rate for current actually consumed. The Brooklyn system was the first to be completed and protects the business and manufacturing parts of that borough, a district lying along the East River from Erie Basin to the Navy Yard, varying in width from a mile to a few hundred feet and about three miles in length, amounting to 1,360 acres. Here a carefully planned network of over 22 miles of mains have been laid, on which are placed at frequent intervals special high-pressure hydrants, while a number of telephone boxes connects fire headquarters and the pumping stations with the individual hydrants. There are two pumping stations, one with five units, each capable of pumping 3,000 gallons per minute against a pressure of 300 pounds, located near the East River at Jerolamon and Furman Streets and connecting with the river by an underground intake so as to use salt water in case of an emergency, while the second or reserve station is located at St. Edwards and Willoughby streets and contains three similar units.

In Manhattan the installation naturally was more extensive and was designed to protect that part of the city between the North River, 23rd street, Second avenue and East Broadway, and Chambers street, a territory aggregating 1,454 acres. In this district were laid 265,000 feet of extra heavy mains tested at the factory to 600 pounds to the square inch, and in the trench with joints, valves, and hydrants to a pressure of 450 pounds. Of the pipe laid, 36,000 feet was 24 inches in diameter, 30,000 feet 20 inches, 47,000 feet 16 inches, and 152,000 feet of 12 inch. The mains of larger size naturally were used to bound the protected area, while parallel and intersecting mains not only provide for maximum amount of circulation but afford sufficient water at any point in the district. On the mains at such intervals that there is always one within at least 400 feet of any building in the district, 1,272 hydrants have been placed, or one hydrant per acre and one to every 210 linear feet of main, while in boxes convenient to each hydrant are telephones connecting with the pumping stations. The contract cost of laying the mains and installing the distribution system was \$2,824,282.75, or an average cost of \$2000 per acre of territory protected, or \$11 per linear foot of main. The pressure, which may amount to as much as 300 pounds to the square inch, is supplied from pumping stations at West and Gansevoort streets, and at South and Oliver streets, where two stations of similar size and design are located at favorably placed points outside of the region of high risk. Each station was equipped with five units, centrifugal pumps, direct connected with induction motors supplied with alternating current by the Edison Company. The combined capacity of the two stations was over 30,000 gallons per minute at a pressure of 300 pounds available at any place in the district.

During the summer the system was put in use and special hose and hose wagons were concentrated in the district. Three engine companies were transformed into special high-pressure hose

companies and the engines were transferred uptown, while all the companies were given special strong hose and were trained in the use of the high pressure, which though effective presented many novelties and some uncertainties. In general it was a pronounced success, and it was considered that the day of three alarm fires and lack of water had passed, but on two occasions, namely at fires at Walker and at Grand streets, the system failed temporarily and the fires were permitted to get some headway, though quenched before they became large conflagrations. In all other cases the high pressure performed in the main satisfactorily, notwithstanding the fact that on occasions the lack of familiarity of the firemen with the apparatus was apparent. The high-pressure system now removes the danger of a large and destructive conflagration in the lower part of the city and on the strength of its work during the first few months of its use an appropriation was made for its extension from Chambers street north to East Houston street. Fresh or city water is used ordinarily by the pumping stations, but each is supplied with a salt water intake extending to the river so that an unlimited supply is available in case of failure of the city water or in the event of a large conflagration. The installation of the high-pressure system in New York and Brooklyn was followed by considerable reductions in insurance rates, varying in the different zones and boroughs. The reductions in New York City amounting to 10 and 5 per cent. it was said aggregated \$400,000 per annum. The high-pressure mains extend to the bulkheads on the river front and connection can be established with the powerful pumps of the fleet of fireboats, which during the year was increased by the addition of two new and more powerful boats. Two large fireboats also were added to the Chicago fire department and were supplied with electrically driven rotary pumps, the dynamos being driven by steam turbines.

A matter of increased interest during the year was the increased use of motor fire apparatus, aside from high speed motor cars for chiefs of departments, particularly in the smaller cities. These automobile vehicles were adopted to secure increased speed and radius of action, and carried their chemical tanks with small amount of chemical hose or small pumps, to which the driving motors of the automobile could be connected. These extremely mobile vehicles with a crew of five or more men, could be sent out immediately on receipt of an alarm, and often by their prompt arrival put out an incipient fire. In some cases the apparatus carried scaling ladders and other devices, while at the end of the year a large, high-powered truck for the high pressure service of New York City, capable of carrying forty lengths of the heaviest hose, was under construction.

FISHER, ANDREW. An Australian political leader, premier of Australia, born at Crosshouse, Kilmarnock, Scotland, on Aug. 29, 1862. He was educated at Crosshouse, and at the age of twenty-three went to Queensland, Australia. In 1893 he was elected to the Australian Parliament. He subsequently served as minister of railways; was a member of the first Commonwealth Parliament; and was for a time Minister for Trade and Customs. On Nov. 12, 1908, he formed a new ministry, in which he is premier and treasurer.

FISHERIES. The YEAR BOOK for 1907 referred to the research work carried on at the United States Bureau of Fisheries Laboratory at Woods Hole, Mass. A more complete report of this work appeared in May, 1908, published by the Director of the laboratory, Dr. F. B. Sumner. A comprehensive biological survey of the region, including preparation of an annotated list of the fauna and flora of the neighboring waters, and extensive determinations of temperature and density, was nearly finished, some of these researches having been continued into the spring of 1908. Experiments were continued on the determination of the palatability and food value of the smooth dog-fish, the squid, and the mussel. It appeared that the "gas bubble" disease which had proved so annoying to fish in confinement, is probably due to excess of air in the water, rather than a bacterial infection. Accordingly a "deaerator" apparatus was devised for use with the water supply to aquaria, and this promised to remove this particular annoyance.

FISHERIES CONGRESS. The Fourth International Fisheries Congress met in Washington, Sept. 23d to 25th, 1908. Delegates were present from nearly every State in the Union, and from about twenty foreign countries. The principal subjects discussed were international fisheries regulations, descriptions of apparatus for hatching and transporting fish, the utilization for food of products such as dog-fish and mussels, not now commonly used, and the protection, in the United States, of lobsters on the Atlantic coast and of white fish on the Great Lakes. Mr. Ayson, of New Zealand, reported that steel-head trout, imported from America about twenty-five years ago, were extremely abundant there, and that Chinook salmon, planted between 1901 and 1907, were well established. Prizes for contributions on special subjects were awarded to eleven competitors.

The life history of the common eel has been very little understood, though, it was shown in 1897 by Grassi and Calandruccio that a pelagic form previously called *Leptocephalus* was in reality the young of this fish. Additional information was obtained and published through the researches of the Danish Fisheries Bureau. Spawning apparently takes place in very deep water, but the process has never been observed. The first indication of the young brood is when the *Leptocephalus* larva appears during May, in regions where the total depth of the water is 100 metres or more. The larvæ swim at the surface during the night, sinking to a depth of 100 meters or so during the day. The period of metamorphosis lasts about a year, during which time the animal takes no food, so that it gets progressively smaller and changes from the flat, ribbon like original form to the rounded "elver" which begins to ascend the rivers. The Danish Commission for the study of the Sea reported on the growth of the plaice, showing that this differs in amount in different localities. The Norwegian herring investigations were carried on by the *Michael Sars*, the vessel engaged in international investigations. The age of herrings, according to this report, is determined by the number of rings on the scales rather than by absolute size, the latter varying in different localities, being greater in fish living in open sea than in those living in sheltered localities.

The British Committee appointed to inquire into the scientific and statistical investigation now being carried on in relation to the fishing industry presented a report recommending, among other things, the following: The continuance of international coöperation in scientific and statistical investigations upon a definite and permanent basis; the continuance of the annual grant of £1,000 to the Marine Biological Association of the United Kingdom; and the establishment of a central council for the United Kingdom, which should have power to arrange for such scientific and statistical investigation as shall be considered desirable for the interests of the fisheries of the kingdom, and to administer such funds as may be voted by Parliament for the purpose of such inquiries.

In the United States the sturgeon was reported as approaching extinction. For a time it was regarded as a pest by the fisherman, who killed it whenever they could, and the more recent utilization of the eggs for the manufacture of caviare decreased the numbers very considerably. Several States considered measures of protection, but thus far owing to lack of uniformity in the laws of different States, little good had been done by legislation.

The British North Sea Fisheries Commission published in 1908 its report on the work covering the time from 1904 to 1905. It was discovered in 1899, by Reibisch, that the concentric rings in the otolith of a fish indicate its age, and this method was employed in determining the growth of the plaice. The older fish are found in deeper water. The female is longer lived than the male, those eight years old and upward being 91 per cent. females. The young of all fish feed on crustaceans, and competition between them is very keen. As they grow older, however, each species of fish limits itself to one species of crustacean.

The report for 1907 of the Lancashire Sea Fisheries Hatchery appeared in 1908. Considerable work was done on the migration of the plaice, and the study of the plankton of the Isle of Man. From the latter study it was observed that the zone of most abundant life is not at the surface, but at a depth of several fathoms. An important part of the report was a monograph on *Cancer*, the edible crab, which contained a good deal of information hitherto inaccessible to the ordinary reader on the biology of this form. The value of the crab fisheries on the coasts of England and Wales was reported as nearly £60,000 annually.

FITHIAN, EDWARD. An American naval officer, died on August 29, 1908. He was born in New Jersey on December 13, 1820; became third assistant engineer in the United States Navy in 1848; was promoted to second assistant engineer in 1851; and advanced to chief engineer in 1859. During the Civil War he served on the *Roanoke*, and was for a time stationed at New York City. His frigate, the *Susquehanna*, accompanied Commodore Perry's expedition to open the ports of Japan, and was also the escort of the *Niagara*, when the first attempt was made to lay the Atlantic cable. In 1882 Captain Fithian retired, and in 1906, in recognition of his service during the Civil War he was made rear-admiral and placed on the retired list with that rank.

FLAX. During the three years 1906-1908, the production of flaxseed in this country varied but little. In 1908 2,679,000 acres of flax were

grown and this area produced 25,805,000 bushels of seed. The crop of flax grown for fibre in the United States is a negligible quantity. The average yield of seed was 9.6 bushels per acre, the average price per bushel on December 1, \$1,184, and the total value on the same date \$30,577,000. While acreage and yield did not vary much, the price per bushel showed marked fluctuations. In 1907 the average bushel price on December 1 was 95.6 cents, and in 1906 101.3 cents. The average price for 1908 was the highest recorded since 1906, and the total value of the crop was the largest since 1902, when the Department of Agriculture began publishing more complete statistics on the crop. As in former years North Dakota ranked first with a total yield of 13,770,000 bushels, followed by South Dakota with 5,885,000 bushels, and Minnesota with 4,526,000 bushels. The aggregate production of these three States, amounting to 24,181,000 bushels, represented about 94 per cent. of the total production for the entire country. Of the ten States reporting yields of flaxseed the highest average yield, sixteen bushels per acre, was secured in Wisconsin, and the lowest, six bushels per acre, in Oklahoma. The average yield for North Dakota was only nine bushels per acre. Kansas and Nevada also report low average yields.

In 1906 the world's production of flaxseed was only 87,541,000 bushels, as compared with approximately 100,000,000 bushels the year before. The same year Argentina, which for several years previous had produced more flaxseed than the United States, ranked second in the world's production, the United States standing first and European Russia third. These three countries produced about 77 per cent. of the world's crop. The world's flax fibre production is limited to Europe and Asia. The yield of fibre in 1906 amounted to 1,846,235,000 pounds, and of this quantity Europe furnished 1,790,021,000 pounds, to which European Russia contributed 1,450,930,000 pounds, and Austria-Hungary, ranking next in importance, 164,620,000 pounds. These countries were followed by France with 46,109,000 pounds, Italy with 41,917,000 and Ireland and Belgium with 26,934,000 and 26,843,000 pounds, respectively.

Although the United States at present produces only flaxseed, an effort was made by the experiment station to create an interest also in growing the crop for fibre. For this purpose it is necessary to develop fibre-producing varieties adapted to our conditions. The Michigan experiment station dropped its work with flax for seed production and was developing strains for fibre growing. About 250 plats of fibre flax were being grown, and each year the seed of those plats only which produce the tallest and finest stems was saved for further trial. The best varieties of seed flax tested in 1905 and 1906 by the Kansas experiment station ranged in yield from 9.15 to 11.58 bushels per acre. The best average yield of seed was secured by seeding at the rate of three pecks per acre, while the thickest sown flax, five pecks of seed per acre, produced the largest quantity of straw, 4,723 pounds per acre.

FLETCHER, JAMES. An English-Canadian botanist, died on November 9, 1908. He was born near Wrotham, Kent, England, on March 28, 1852, was educated at King's School, Rochester, and in 1874 went to Canada. He was then Dominion Entomologist to the Department of Agriculture until in 1887 he was appointed

Entomologist and Botanist to the Dominion Experimental Farms at Ottawa. In the same year he became assistant editor of the *Canadian Entomologist*. Of the Ottawa Field Naturalists' Club he was the organizer and president. In 1886 he was elected a fellow of the Linnean Society of London, and he was the leading spirit of the Botanical Club of Canada. His energetic and successful work in devising ways of exterminating harmful insects got for him the name of "the farmer's friend" throughout Canada. In botany he made an especial study of aquatic forms and violets. He had published a "Flora Ottawaensis" in the *Transactions of the Ottawa Field Club*, vols. 1-V (1880-84), and continued that subject in the *Ottawa Naturalist*, vols. II-VII (1888 and afterwards).

FLORIDA. The southernmost State of the American Union. Its total area is 56,666 square miles, of which 3,085 square miles are occupied by lakes, rivers, and ponds. According to the Federal census of 1900 the population was 528,542, and by the State census of 1905, 612,541. According to the Federal estimate of 1908 the population in that year was 662,942. The population of the largest cities in 1905 was: Jacksonville, 35,301; Tampa, 22,823; Pensacola, 24,850; Key West, 20,498.

MINERAL PRODUCTION. The legislature of 1907 authorized a State Geological Survey. Work was begun in 1907 and was vigorously pursued until 1908. The leading industry of Florida is phosphate mining. From 1888, the beginning of actual mining, to the beginning of 1908, 12,000,000 tons of phosphate to the value of \$48,000,000, were obtained from Florida fields. The amount produced in 1907 was 1,386,578 long tons, valued at over \$6,500,000. Among other minerals which are mined in large quantities are clay, including plastic, kaolin, and brick-making clays, fullers' earth, lime, and cement. Kaolin was mined in 1907 to the value of \$97,690 from 19,615 tons. The production of fullers' earth in 1907 was 24,148 short tons, valued at \$235,443. Road-making materials, including flint, chert, and road-making clays, are also found in the State. In 1907 native sulphur was found in Florida, a large mass estimated to weigh two tons having been brought up from the pit of the Dutton Phosphate Company of Floral City. In 1907, 43,430 gallons of mineral water, valued at \$12,378, were produced. According to figures by the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production of the State in 1907 was \$7,365,754, as compared with \$6,395,825 in 1906.

AGRICULTURE AND STOCK RAISING. The acreage, production, and value of the principal crops in 1908 were as follows, according to the figures of the United States Department of Agriculture: Corn, 6,584,000 bushels, valued at \$3,309,000 from 627,000 acres; oats, 425,000 bushels, valued at \$313,000 from 30,000 acres; rice, 50,000 bushels, valued at \$46,000 from 2,000 acres; potatoes, 415,000 bushels, valued at \$560,000 from 5,000 acres; hay, 26,000 tons, valued at \$385,000, from 19,000 acres; tobacco, 5,568,750 pounds, valued at \$949,662, from 5,625 acres. The cotton crop of 1908-9 was estimated at 61,000 bales, which is slightly less than the crop for 1907-8, which was 64,000 bales. The production has steadily fallen from 1904, when the crop was 80,551 bales. The number of farm animals in 1908 was as follows: Horses, 54,000; mules, 20,000;

dairy cows, 93,000; other cattle, 691,000; sheep, 99,000; swine, 447,000. The number of horses and all classes of cattle have increased considerably in the last few years. The estimated value of the wool clip in 1908 was \$72,000.

MANUFACTURES. Florida made very considerable progress in manufacturing from 1900 to 1905, though still unimportant as a manufacturing State. The census of 1905, including all establishments classed as factories, showed 1,413 such, with \$32,971,982 capital, an average of 42,091 wage-earners, and products valued at \$50,298,290. These four items were, respectively, 10.8, 28.4, 18.7, and 47.1 per cent. larger than in 1900. Of the wage-earners only 2,098 were women at least sixteen years of age, and only 337 were children under sixteen. The value of the products of leading industries in 1905 was as follows: Tobacco, cigars and cigarettes, \$16,764,276; lumber and timber products, \$10,901,650; turpentine and resin, \$9,901,905; planing mill products, \$1,690,455; and fertilizers, \$1,590,371. The manufacture of cigars and cigarettes made the notable increase of 56.2 per cent. in value of products from 1900 to 1905. Lumber and timber products increased very little, but the value of turpentine and resin increased 53.1 per cent. In this industry Florida ranked first in 1905. The quantity of spirits of turpentine produced in 1905 was 12,872,869 gallons, and the quantity of resin was 1,445,902 barrels of 280 pounds each. Both of these products increased greatly in market price during the five years. Tampa was credited with \$11,264,123 in value of products in 1905, Jacksonville with \$5,340,264, Key West with \$4,254,024, and Pensacola with \$1,936,751.

EDUCATION. According to the biennial report of the Superintendent of Public Instruction for the two years ending June 30, 1908, the total school population of the State is estimated at 224,677. The total enrollment of all pupils in all the public schools for the period was 134,722, thus showing that only about 60 per cent of the children of legal school age were enrolled in the public schools. Of the number enrolled only about 70 per cent., or 94,987, were in average daily attendance. The average length of the school term in the State for the scholastic year was 5.4 months. The average monthly salary of teachers in \$44.69 for a term of 5.4 months. The State has no compulsory attendance law, although attempts have been made to pass such a law through the legislature for several years. The Superintendent of Education in his report urges the passage of an optional compulsory attendance law, by which compulsory education shall be allowed in such counties as desire it. The Legislature of 1907 passed a law regulating the salaries of county superintendents of public instruction, establishing a graduated system of salaries, ranging from \$600 a year as a minimum to \$2,400. The average monthly salary of the county superintendents for the year 1907-8 was \$1,129. This measure has been found valuable in securing the services of competent men for their whole time.

FINANCE. The report of the treasurer for the fiscal year ending December 31, 1907, showed a balance on hand January 1, 1907, of \$120,777.28. The receipts for the year, including this balance, were \$939,717.88; the expenditures for the year were \$892,204.25, leaving a balance January 1, 1908, of \$47,513.63. The receipts of the one mill school fund for the fiscal year 1907 were

\$151,759.42; the expenditures, \$142,486.66, leaving a balance January 1, 1908, of \$9,272.76. The receipts of the pension tax fund for the fiscal year 1907 were \$611,930.93; the expenditures, \$354,653.17, leaving a balance on hand January 1, 1908, of \$257,277.76. The receipts of the States convict fund for the fiscal year 1907 were \$304,218.64; and the expenditures, \$241,234.64, leaving a balance on January 1, 1908, of \$62,984.

POLITICAL CONVENTIONS AND ELECTIONS. On June 16th the Democratic primary elections were held, in which candidates for United States Senator, Governor, and Railroad Commissioner were chosen. Governor Broward was defeated for the Senatorship by Duncan U. Fletcher, of Jacksonville. Albert W. Gilchrist, who was the local option candidate, won the nomination for Governor. The prohibition issue figured largely in the election. William James Bryan, who was appointed to the Senate in 1907, died on March 21, 1908, and Governor Broward appointed William Hall Milton, of Marianna, to succeed him. Mr. Milton's appointment was for the unexpired term of Senator Mallory, which had been previously filled by the appointment of Mr. Bryan. In the election of November 3, the vote for the National ticket was as follows: Bryan, 31,104; Taft, 9,923; Chafin, 1,356; Debs, 3,747; Watson, 1,946; Hisgen, 553. For Governor, Gilchrist (Dem.), received 33,036 votes; Cheney (Rep.), 6,453; Pettigrew (Soc.), 2,427.

OTHER EVENTS. A stubborn street railway strike broke out in Pensacola in April and rioting was carried on to such an extent that troops were ordered to the city on April 12th. The conflicts arose among the striking employees of the railroad and strike-breakers imported to take their places. See STRIKES.) On March 1st a fire destroyed eighteen and one-half city blocks in Tampa and destroyed 308 buildings, rendering 1,200 persons homeless. The loss amounted to \$600,000. Among the buildings burned were several large tobacco factories.

STATE OFFICERS. Governor, Albert W. Gilchrist; Secretary of State, H. C. Crawford; Treasurer, W. V. Knott; Comptroller, A. C. Croom; Attorney-General, Park M. Trammell; Auditor, Ernest Amos; Adjutant General, J. C. R. Foster; Superintendent of Public Instruction, W. M. Holloway; Commissioner of Agriculture, B. E. McLin—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, T. M. Shackelford; Associate Justices, W. A. Hocker, R. F. Taylor, J. B. Whitfield, Chas. B. Parkhill and R. S. Cockrell; Clerk, Milton H. Mabry—all Democrats.

The Legislature of 1908 was composed of thirty-two Democrats in the Senate, and sixty-eight Democrats and one Socialist in the House. The State representation in Congress will be found in the article UNITED STATES, section Congress.

FLUORESCEIN. An orange-red powder, prepared by the fusion of phthalic anhydride and resorcinol. It is known chemically as dioxy-fluoran and has the formula $C^{20}H^{14}O^6$. The sodium salt of fluorescein is used by ophthalmologists for the detection of minute foreign bodies embedded in the cornea, and the diagnosis of cornea lesions. Ulcers or areas of the cornea which have suffered a loss of epithelium will stain green and remain so for a time when treated with a weak solution of fluorescein, while the normal corneal surface will show no

change. Foreign bodies become surrounded by a green ring and thus become more visible. Ulcers of the conjunctiva are stained yellow.

FOLK LORE SOCIETY, AMERICAN. See ANTHROPOLOGY.

FOOD AND NUTRITION. FOOD INSPECTION. The National Food and Drugs Act of June 30, 1906, which forbids the importation into or exportation from the United States, the introduction into interstate commerce and the manufacture and sale in the District of Columbia and the Territories, of misbranded or adulterated food and drugs, received vigorous enforcement during the year 1908. The corps of inspectors who procure samples for analysis and information regarding the manufacture and sale of food and drugs was increased to thirty-nine. Additional branch laboratories for the examination of these products were opened at Honolulu, Nashville, Omaha, Pittsburg, and St. Louis, making a total of twenty-one of these laboratories in addition to the main laboratory of the Bureau of Chemistry of the Department of Agriculture, at Washington, D. C. Approximately 13,400 samples were collected during the year. Of these 814, which were found to be adulterated or misbranded, were reported to the Board of Food and Drug Inspection of the Department of Agriculture for preliminary hearing prior to referring them to the respective district attorneys for prosecution. Of the 135 cases actually pending during the year, fourteen criminal cases resulted in conviction with fines ranging from \$5 to \$700 and costs, and fourteen seizure and condemnation cases resulted in forfeiture and condemnation of the goods. Up to the end of 1908 not a single decision had been adverse to the government, and very great improvement in trade practices was effected in many lines of goods, manufacturers and jobbers as a class evincing a willingness to coöperate in the enforcement of the law. Under the national law the establishment of food standards is largely delegated to the Secretaries of Agriculture, Treasury, and Commerce and Labor, and the details of enforcement to the Secretary of Agriculture. A number of food inspection decisions were issued by the Department of Agriculture during the year, these being mainly rulings as to the use of quantities and labels, the use of dyes and preservatives, and similar details. Exception being taken by certain commercial interests to some of the earlier decisions, notably those relating to the addition to food of benzoate of soda and sulphur dioxide, a Referee Board of Consulting Experts, headed by President Ira Remsen, of Johns Hopkins University, was appointed by President Roosevelt to render final decision both as to the wholesomeness of these substances and as to other matters of controversy. Pending action by this board, the use of benzoate of soda, in amounts not to exceed one-tenth of 1 per cent., and of sulphur dioxide in ordinary amounts was permitted in goods to which they had commonly been added, provided the foods were properly labelled to show the addition of these substances. The importation of foods greened with copper salts was entirely prohibited after January 1, 1909, and the use of nitrogen oxids for the bleaching of flour was prohibited after June 10, 1909, except in exports to certain countries.

The various State pure food laws were for the most part vigorously enforced, a great advance in public sentiment being clearly apparent. There

seemed to be a distinct tendency to extend governmental regulation to such matters as misbranding as to the weight or volume of packages, the sanitary conditions under which food products are prepared, and in general the cleanliness and wholesomeness, as well as the purity of food and dairy products. An International Congress for the Repression of Adulteration of Alimentary and Pharmaceutical Products was held at Geneva, Switzerland, in September. About 400 delegates were in attendance, mainly from France, but also representing twenty-eight other nations. The chief business of the Congress was the formulating of definitions of standard food and drug products for adoption as an international "codex alimentarius" with a view to securing greater uniformity. An International Food Congress was also held at Ghent in November, at which particular attention was given to methods of analysis and related topics.

PROGRESS IN NUTRITION STUDIES. In connection with the administration of the various pure food laws, a large number of special investigations were conducted. Among these may be cited the extended studies by the Department of Agriculture and several experiment stations of the practice of bleaching certain grades of flour with nitrogen peroxid to produce a whiter product, such as seems to be demanded by many consumers. A series of digestion experiments was reported by Snyder, in which no difference whatever was observed in the completeness of digestion by healthy men of breads made from bleached and unbleached flours. Regarding the propriety of the practice there has been much difference of opinion among authorities. Experiments with preservatives were reported by Wiley, in which healthy young men were used as subjects. In experiments to test the effect of benzoic acid and benzoate of soda, data were obtained as to variations in body weight, composition and character of the excretory products, balance of income and outgo of sulphur, phosphorus and nitrogen, microscopic characteristics of the blood and urine and similar details, from which it was concluded that the administration of either benzoic acid or benzoate of soda is highly objectionable and produces a very serious disturbance of the metabolic functions, attended with injury to digestion and health. Similar experiments with sulphurous acid and sulphites led to the conclusion that these substances are likewise objectionable. Experiments were also conducted at the University of Illinois with special reference to the use of saltpetre in meat products and by the United States Referee Board on Foods on benzoate of soda.

Considerable progress was made along the line of preparing food products without preservatives. Methods were devised for preparing tomato ketchup, apple and grape juices, and canned peas, and there were also experiments in the drying of fruits. It was claimed that the necessity for the employment of preservatives was much over-estimated and that by proper precautions their use could be much restricted. A study of commercial meat extracts and similar preparations indicated that the nutritive value of this class of foods is rather limited, representing to only a partial degree that of the beef or other meat from which derived, but they are believed to possess considerable stimulating qualities and are also often useful on account of their flavoring properties.

Interest in food problems, especially from the standpoint of public health, received a notable impetus from the International Congress on Tuberculosis held in Washington, September 21 to October 12, at which much attention was devoted to questions dealing with the safeguarding of the milk and meat supply. A large amount of illustrative material was on exhibition in Washington and later in New York, and visited by thousands of people, which dealt not only with the specific prevention and treatment of tuberculosis, but also included many exhibits of practical application to everyday life. During the Congress, a model dairy was in daily operation, the milk from which repeatedly gave extremely low bacterial counts under conditions believed to be within easy access of the average producer.

Efforts to obtain additional national assistance in questions pertaining to public health were continued during the year under the leadership of the Committee of One Hundred on Public Health, which, together with the American Association for the Advancement of Science, the American Health League, and the National Legislative Conference of the American Medical Association, held an important symposium on public health in December in Baltimore. The matter of Federal action was formally brought to the attention of Congress by President Roosevelt in his annual message, in which he recommended the concentration under a single Executive Department of the work of the various government bureaus, such as the pure food and meat inspection service of the Department of Agriculture and the studies of the Public Health and Marine Hospital Service of the Treasury Department, which are now carried on along independent lines.

A special laboratory building for nutrition research was completed in Boston for the Carnegie Institution. This was equipped with a number of respiration calorimeters and accessory apparatus, whereby complete records may be obtained for days at a time of the income to and outgo from the human body of matter and energy, together with accurate data as to changes in body weight, body temperature, pulse rate, respiration, etc. Elaborate metabolism investigations have begun dealing with both physiological and pathological conditions. The first respiration calorimeter ever built in the United States, formerly at Wesleyan University, was re-located in one of the new laboratory buildings of the Department of Agriculture at Washington and entirely reconstructed for use in studies of the nutritive value of agricultural products used for human food and of methods for their more effective utilization.

A course in biochemistry was added to the curriculum of the Graduate School of Agriculture at its 1908 session. Lectures and seminars of the highest interest from the standpoint of human and animal physiology and nutrition were given by several authorities from this country and Dr. N. Züntz, of Berlin. Following a conference of those in attendance on these courses the American Society of Animal Nutrition was organized in November by agricultural college and experiment station workers with a view to improving the quality of investigation in animal nutrition and to promoting more systematic and better correlated study of its problems.

The question of the food requirements of the human body continued to be vigorously discussed

during the year, especially those phases bearing on the needs for protein and energy. One of the most important contributions to the subject was made by Captain D. McKay, professor of physiology of the Medical College of Calcutta, as to the metabolism of Bengalis. The Bengalis, who are descended from a race of the same general physique as Europeans, have accustomed themselves to a diet supplying only about one-third the quantity of protein usually considered to be most desirable. The researches reported indicate, however, that although the feasibility of maintaining the body for long periods of time in nitrogenous equilibrium on such low protein diets as have been recently advocated has been demonstrated, this is done at the cost of reduced physical development and efficiency and with increased susceptibility to certain diseases.

The subject of food and dietetics in its relation to home economics received much attention during 1908. In addition to regular undergraduate courses in home economics in about twenty-five agricultural colleges and similar institutions, a second session of the Graduate School of Home Economics was held at Ithaca, N. Y., July 13-24, in connection with the Graduate School of Agriculture. Brief extension courses on foods and other household questions were arranged for farmers' wives by several institutions. The department of household science of the University of Illinois offered a summer course at one of the Chautauqua assemblies, using tents furnished as a series of model rooms. Another innovation was a ten-day course in domestic science at the National Corn Exchange at Omaha, Neb., in which daily demonstrations and lectures were given to a regular class of sixty young women, but open to the general public. As an outgrowth of the Lake Placid Conference of Home Economics, which since 1899 has held annual meetings for the furtherance of work in home economics, an American Association of Home Economics was organized in Washington December 31, with an initial membership of over 800.

COST OF FOOD. Retail prices of food, as of most other commodities, continued to advance during the year. Data were published by the United States Bureau of Labor showing that for 1907 retail prices of food were 4.2 per cent. higher than in 1906 and that in December, 1907, prices were 25 per cent. higher than the average for the ten-year period 1890-1899. The advance was most marked during the year in flour, corn meal, potatoes, and milk, but no article showed any decline. Wholesale prices also increased to about the same extent.

NEW BOOKS. Among the books of the year are the following: H. Snyder, *Human Foods and Their Nutritive Value* (New York); Isabel Bevier and Anna R. Van Meter, *Selection and Preparation of Food, Laboratory Guide* (Boston); C. S. Read, *Fads and Feeding* (London); *Milk and Its Relation to the Public Health*, Public Health and Marine Hospital Service, U. S. Hygiene Laboratory Bulletin No. 41; E. Wagner, *Recipes for the Preserving of Fruit, Vegetables and Meat* (London and New York); J. Varges, *Nahrungsmittelchemie* (Leipzig); J. König and A. Juckenack, *Die Anstalten zur technischen Untersuchung von Nahrungs und Genussmitteln so wie Gebauchgegenständen in Deutsche Reiche* (Berlin); C. A. Neufeld, *Der Nahrungsmittelchemiker als Sachverständiger* (Berlin); Amy L. Pope and Mary L. Carpenter, *Essentials of Diet in Health and Disease* (New York);

C. Von Noorden, *Metabolism and Practical Medicine* (Chicago); C. A. Herter, *The Common Bacterial Infections of the Digestive Tract* (New York and London); O. Cohnheim, *Die Physiologie der Verdauung und Ernährung* (Berlin and Vienna); M. Rubner, *Volksernährungsfragen* (Leipsic); and *Das Problem der Lebensdauer und seine Beziehungen zur Wachstum und Ernährung* (Oldenburg); and M. Toubeau, *La législation répressive des fraudes et falsifications sur les produits alimentaires* (Paris).

FOOT AND MOUTH DISEASE. See VETERINARY SCIENCE. AGRICULTURE.

FOOTBALL. A striking feature of the football season of 1908 was the excellent showing made by the smaller colleges. This increase in strength was chiefly attained through the instrumentality of the new rules, which appear to have placed the smaller institutions on a more equal footing with the larger. The place and drop kicks were used with greater frequency than in any previous season and were the deciding factors in many of the important games. The forward pass, because of the severe penalties attached to its improper execution, and also because of the danger of the ball being secured by the opponents of the team executing it, was only utilized in times of extreme emergency. It is expected that changes in the rules governing this play will eventually have to be made. The fact that so many games played during 1908 ended in a tie score also seems to call for some innovations in the rules. Some experts recommend as a remedy an extension of the playing period for a certain length of time, or until the tie is broken.

Harvard was generally accredited with having had the best team among the Eastern colleges, having finished the season without losing a game. Pennsylvania also was undefeated, but that team's schedule was not regarded so difficult as Harvard's. These leading teams, however, were played to a tie, Harvard by Annapolis, and Pennsylvania by Carlisle. In the generally accepted ranking Harvard and Pennsylvania are followed in order by Yale, Dartmouth, Carlisle, Cornell, Brown, West Point, Annapolis, and Princeton. The following is a summary of the games played by the leading Eastern colleges: *Harvard* defeated Bowdoin 5-0, Maine 16-0, Bates 18-0, Williams 10-0, Brown 6-2, Carlisle 17-0, Dartmouth 6-0, Yale 4-0, *Pennsylvania* defeated Virginia 6-0, Ursinus 30-0, Bucknell 16-0, Villanova 11-0, Pennsylvania State 6-0, Brown 12-0, Lafayette 34-4, Michigan 29-0, Cornell 17-4. *Yale* defeated Wesleyan 16-0, Syracuse 5-0, Holy Cross 18-0, West Point 6-0, and Princeton 11-0, and was tied by Brown 10-10, and defeated by Harvard 0-4. *Dartmouth* defeated Vermont 11-0, Tufts 18-0, Holy Cross 18-5, Amherst 17-0, and Princeton 10-6, and was tied by Williams 0-0, and defeated by Harvard 0-6. *Carlisle* defeated Villanova 10-0, Pennsylvania State 12-5, Syracuse 12-0, Annapolis 16-6, and Saint Louis 17-0, and was tied by Pennsylvania 6-6, and defeated by Harvard 0-17 and by Minnesota 6-11. *Cornell* defeated Hamilton 11-0, Oberlin 23-10, Colgate 9-0, Vermont 9-0, Pennsylvania State 10-4, Amherst 6-0, and Trinity 20-6, and was tied by Chicago 6-6, and defeated by Pennsylvania 4-17. *Brown* defeated New Hampshire State 34-0, Bates 35-4, Colgate 6-0, Bowdoin 12-0, and Vermont 12-0, and tied Yale 10-15, and was defeated by Lafayette

6-8, by Harvard 2-6, and by Pennsylvania 0-12. *West Point* defeated Tufts 5-0, Trinity 33-0, Colgate 6-0, Villanova 25-0, and Annapolis 6-4, and was tied by Princeton 0-0, and by Washington and Jefferson 6-6, and was defeated by Yale 0-6. *Annapolis* defeated Rutgers 18-0, Dickinson 22-0, Lehigh 16-0, George Washington 17-0, Villanova 30-6, and Pennsylvania State 5-0, and tied Harvard 6-6, and was defeated by Carlisle 6-16, and by West Point 4-6. *Princeton* defeated Villanova 6-0, and Fordham 17-0, and tied Lafayette 0-0, Syracuse 0-0, and West Point 0-0, and was defeated by Dartmouth 6-10, and by Yale 6-11.

The University of Chicago made the best showing of the Western colleges, finishing the season without suffering a defeat. Other leading teams were Wisconsin, Illinois, Minnesota and Michigan. *Chicago* defeated Purdue 39-0, Indiana 29-6, Illinois 11-6, Minnesota 29-0, and Wisconsin 18-12, and tied Cornell 6-6. *Wisconsin* defeated Lawrence 35-0, Indiana 15-0, Marquette 9-6, and Minnesota 5-0, and was defeated by Chicago 12-18. *Illinois* defeated Indiana 10-0, Iowa 22-0, Purdue 15-5, and Northwestern 64-8, was tied by Marquette 6-6, and was defeated by Chicago 6-11. *Minnesota* defeated Lawrence 6-0, Ames 17-12, and Carlisle 11-6, and was tied by Nebraska 0-0, and was defeated by Wisconsin 0-5, and by Chicago 0-29. *Michigan* defeated Notre Dame 12-6, Vanderbilt 24-6, and Kentucky 62-0, and was defeated by Pennsylvania 0-29, and by Syracuse 4-28.

Virginia and Vanderbilt were the leading teams among the Southern colleges. Louisiana State University also made a good showing, going through the season without defeat, but did not meet such strong teams as the first-named colleges. Other prominent Southern teams were Tennessee, Sewanee, and Virginia Polytechnic.

FORAKER, JOSEPH BENSON. United States Senator (Republican), from Ohio. He was born near Rainsboro, Ohio, on July 5, 1846. In 1862 he joined the Union Army as a private in the Eighty-ninth Ohio Volunteer Infantry, in which he became first lieutenant, and later received the brevet of captain. He graduated at Cornell in 1869 and the same year was admitted to the bar. From 1879 to 1882 he was judge of the Supreme Court of Cincinnati, and from 1886 to 1889 served as Governor of Ohio. In 1896 he was elected United States Senator, and he was re-elected in 1902 for the term ending March 3, 1909. As a Senator he exhibited unusual knowledge of constitutional law and was regarded as one of the ablest of the Republican leaders. He consistently opposed many of the Roosevelt administration policies, notably railway rate regulation and the discharge of the negro soldiers, following the Brownsville affair in 1906. In 1908 he was a candidate for the Republican presidential nomination, but at the convention in June succeeded in mustering only sixteen votes. During the political campaign of 1908, Senator Foraker was charged by William R. Hearst with having accepted, while Senator, retaining fees from the Standard Oil Company. In substantiation of this charge Mr. Hearst publicly read several letters from John D. Archbold, vice-president of the Standard Oil Company, to Senator Foraker, some of which discussed pending legislation affecting the company, while others dealt with proposed political appointments and candidacies in which the Com-

pany was interested, and still others with which were enclosed certificates of deposits, in favor of Senator Foraker, for various sums ranging from \$5,000 to \$50,000. Senator Foraker issued several statements denying wrongdoing on his part. He finally withdrew from the contest for the nomination. See OHIO; PRESIDENTIAL CAMPAIGN.

FORDHAM UNIVERSITY. A Roman Catholic Institution of higher training in New York City, which existed from 1841 to 1905 as St. John's College, Fordham. In that year, following the opening of the Schools of Law and Medicine, it took its present title. The University had in 1908 six hundred and thirty students and one hundred instructors. Its library contained 60,000 volumes; the value of its property was \$1,500,000. The total number of students graduated since organization was 1,131. The president of the University is Rev. Daniel J. Quinn, S. J. The following officers preside over the respective departments: Rev. J. P. Quirk, S. J., Dean of Arts School; Paul Fuller, LL.D., Dean of Law School; Jas. J. Walsh, M.D. LL.D., Dean of School of Medicine.

FOREIGN MISSIONS, AMERICAN BOARD OF COMMISSIONERS FOR. An organization founded in 1810 by the Congregational Church and incorporated two years later. It is the oldest foreign missionary society in the United States. Its first missionaries were sent out in 1812 to India, and since that date the Board has commissioned 2,551 persons. There were in 1908 twenty-one missions, including 117 stations, and 1,474 out-stations in Africa, Turkey, India and Ceylon, China, Japan, Philippines, and Meconesia. The American missionaries number 594, and the churches under the auspices of the American Board number 554, with 71,137 communicants, of whom 6,407 were added during the year. There are 1,266 educational institutions of various grades, having 64,546 pupils. The native force of pastors, preachers, catechists, and teachers was more than seven times as numerous as the missionaries sent from America. The native communities contributed for Christian work two-thirds as much as the amount given by individuals and churches in America, or \$253,950. The receipts of the Board for the year were \$837,999.15, making the total receipts from the beginning \$38,580,264. The American Board is supported entirely by voluntary contributions. The president is Samuel L. Capen, LL. D.; and the secretaries are James L. Barton, D.D., Cornelius Patton, D.D.; editorial secretaries, E. E. Strong, D.D., and Rev. William E. Strong. The headquarters of the Board are at the Congregational House, Boston, Mass.

FOREST FIRES. See FORESTRY; CANADA, section on *History*.

FORESTRY. Conservative forestry received a decided impetus in 1908 through the calling together, by President Roosevelt, of the governors of all the States to meet with a number of other prominent individuals in a conference at the White House in May to discuss the conservation of the natural resources of the country. Out of this meeting grew the National Conservation Commission. A second meeting was held in Washington in December, when attention was called to the rapidly waning timber supply of the United States. About four-fifths of the total wooded area in 1908 was in private

holdings and the timber was in more or less danger of immediate destruction. The National Forests embraced practically the remainder of the forests, and at the rate of cutting they would supply the lumber requirements of the country for about ten years. The consumption of timber in the United States in 1908 was three times the annual increment, and unless the destructive use of the forests soon ceased it was feared that a timber famine would surely follow. Some needed legislation looking to forest protection and conservation was secured during 1908, but much remained to be enacted.

Statistics collected by the United States Bureau of the Census and the Forest Service show that 28,850 mills reported a timber cut in 1907 of 40,256,154,000 ft. B. M. In addition there were cut 3,663,602,000 lath and 11,824,475,000 shingles. The mill value of the reported cut was \$707,095,409 and it was estimated that with complete statistics the value of the lumber, lath, and shingles cut in the United States during 1907 would approximate \$750,000,000. The leading States contributing to this output were Washington, with 9.4 per cent. of the total cut; Louisiana, 7.4 per cent; Texas, 5.5 per cent.; Mississippi, 5.2 per cent.; and Wisconsin, 5 per cent. These States were closely followed by Arkansas, Michigan, Pennsylvania, Minnesota, and Oregon, in the order named, these ten States furnishing practically 60 per cent. of the total cut of the country. The principal species of trees cut were yellow pine, Douglas fir, white pine, oak, and hemlock, in the order named. The exports of forest products for 1907 were valued at \$93,000,000, and the imports, which consisted mostly of wood pulp, cabinet woods, and rubber, amounted to \$122,000,000.

During the summer of 1908 severe droughts visited many portions of the country and forest fires were frequent and destructive, the estimated losses due to forest fires in 1908 being over \$50,000,000. The most serious of the fires were in Minnesota, Michigan, and Wisconsin, where, in addition to the forest areas burned over, the towns of Chisholm and Hibbing were destroyed. The losses from the forest fires between September 15 and September 30, 1908, have been estimated at over \$1,000,000 a day. Serious fire losses were also reported in New York, Pennsylvania, and Montana. The National Forests suffered relatively little loss due to fire. No data were available for 1908 at the end of the year, but in 1907 the timber destroyed in the forest reserves was valued at only \$31,590. The system of patrols established makes it possible to put out many incipient fires, over 1,200 of which were extinguished in 1907.

THE NATIONAL FOREST SERVICE. The activities of the Forest Service of the United States Department of Agriculture take quite a range and include the administration of the National Forests, national, State, corporate, and individual co-operative enterprises, and general and special investigations of forest problems. In all branches decided progress was reported for 1908. At the end of the fiscal year, June 30, 1908, there were 182 National Forests, embracing 167,975,606 acres, in nineteen States and Territories, including Alaska and Porto Rico, a net gain of 17,142,941 acres placed under conservative management during the year. Since that time numerous changes have been made in the boundaries of the reserves, and on December 31, 1908, they numbered 145 and embraced 168,681,-

From Special Report of the Secretary of Agriculture, in Relation to the Forests, Rivers, and Mountains of the Southern Appalachian Region

LAND EROSION NEAR MARION, N. C.

SHOWING RAPID REMOVAL OF THE SOILS BY HEAVY RAINS WHEN THE FOREST COVER IS REDUCED OR DESTROYED

039 acres. The latest to be set aside were the North Dakota, where 14,080 acres were reserved in the Bad Lands Region as an experiment station in forest planting, and the Ocala and Choctawhatchee, in Florida, together amounting to 674,891 acres. The latter are the only National Forests east of the Mississippi River. In pursuance of the policy that the forests are for use, the receipts from all sources for 1908 were \$1,842,281.87, derived as follows: Grazing, \$962,829.40; timber sales, \$849,027.24; special uses, \$30,425.23. Under the law 25 per cent. of these gross revenues go to the States in which the reserves are located for road and school purposes and the balance to the Federal Treasury. The expenditures on the National Forests during 1908 were \$3,118,267.21, or an excess of about \$1,200,000 over the receipts. This was due to the policy of declining permits for large sales and lower stumpage charges. In addition to privileges for which charges were made, the free use of timber valued at \$168,720 and a considerable amount of free pasturage were granted to settlers and others on or near the reserves, no charge being made or permit required for pasturing a limited number of stock. The executive and administrative force employed in connection with the National Forests on June 30, 1908, consisted of twenty-nine inspectors, ninety-eight supervisors, sixty-one deputy supervisors, forty-one assistants, 521 guards, and eighty-eight clerks. All the National Forests except the Luquilo, in Porto Rico, were under administration in 1908, the entire cost of protection and management being \$0.01856 per acre. In order more efficiently to administer the National Forests and to promote a much freer use of them, six inspection districts have been created with local headquarters in charge of a district forester, who decides all matters pertaining to use without reference to Washington. The locations of the headquarters are: Missoula, Mont., Denver, Colo., Albuquerque, N. Mex., Ogden, Utah, San Francisco, Cal., and Portland, Oreg. In addition to administering and protecting the forests, considerable work was being done in improving them, and in 1908 over 700,000 trees were planted in the National Forests in Nebraska, Kansas, Colorado, New Mexico, Arizona, Utah, Idaho, and California, and more than 2,200,000 seedlings were available for planting in the spring of 1909. Experiments were in progress in broadcast seed sowing in twenty-four of the government forests, to restock them. If successful, this method was to be extensively followed. Under authority from Congress a survey of the Southern Appalachian and White mountains was made and the Secretary of Agriculture recommended the purchase as National Forests of 5,000,000 acres in the Appalachians and 600,000 acres in the White Mountains.

FORESTRY IN THE PHILIPPINES. Next to the Forest Service, the most extensive official organization for forest administration connected with this government is that in the Philippines. Increased interest and revenues are reported in the report of the Director of the Bureau of Forestry, the revenue for 1907 being \$191,080.49 Philippine currency, an amount exceeding the expenses of the Bureau by about 45 per cent. According to an estimate made in 1908, fully one-half of the area of the islands was in forests. There were believed to be fully 25,000 square miles in forests that will yield 40,000,000 ft. B. M., only one-eighth of which was being

utilized. In May, 1908, there were thirty-one mills in operation in the Philippines with a daily output of about 250,000 ft. B. M. Much of this lumber is marketed in Manila, where it competes successfully with Oregon pine and California redwood. The stumpage charges of the Philippine government are from \$1.00 to \$5.00 gold per acre, and the lumber sells in Manila at from \$30 to \$150 gold per thousand feet, the latter price being paid for narra and other fine cabinet woods. The Bureau of Forestry of the Philippines was well organized, and besides the director there were nineteen trained foresters and assistants and twenty-three rangers, as well as draughtsmen, clerks, etc. Surveys were being rapidly made and every facility was offered for the use of the forests under the license system. Harry D. Everett, chief of the Division of Forest Administration of the Philippine Forest Service, was killed by natives on the Island of Negros, May 11, 1908.

PROGRESS IN STATE, MUNICIPAL, AND CORPORATE FORESTRY. In Alabama a State forest commission was organized, forest wardens were provided for, and provision made for a forest reserve fund. Taxes were reduced on small areas of re-forested land for a period of years, and co-operative work was begun in testing various timbers. The State forester of California was conducting extensive experiments with various species of eucalyptus as commercial trees, and had cleared fire lines about the redwood forests. A tract of 295 acres on Mt. Tamalpais has been deeded to the Government as a national monument to be known as Muir Woods. It contains an especially fine stand of redwood, and its perpetuity is assured. The preservative treatment of poles and railway ties was being tested at Los Angeles. Colorado, Kansas, and Nebraska, through State agencies, were doing a large amount of tree planting. In Connecticut more than 350,000 tree seedlings of various kinds were planted during the spring of 1908. A forest survey of the State was in progress, and advice was given by the State forester on the planting and care of private woodlands. In Delaware the State agricultural experiment station and the Federal Forest Service are co-operating in the development of a State forest policy. Georgia had a forestry association, and educational work was being fostered in the State University. In Hawaii forestry along protective lines was extensively practised and over 440,000 acres of territorial and private lands were set aside as forest reserves. Considerable progress was reported in the cutting of 5,000,000 ohia ties for one of the transcontinental railroads. The University of Illinois and the State Normal School at DeKalb established experimental plantations. The State Forest Commission of Indiana was making a survey of the forest resources of the State, carrying on tree planting operations on the State reserve, and promoting forestry in various ways. The Iowa Agricultural Experiment Station was doing considerable propaganda work and was giving attention to the improvement of woodlots, groves, etc. In Kentucky the State Board of Agriculture was investigating the forest resources of the State, and with the Forest Service was studying the timber supply of the eastern portion of the State. Maine developed her system of fire protection to a high degree of efficiency. Practical planting operations were conducted by the students of the State University. A State forest survey was

being made of Maryland and a system of reserves was being developed through private donations. The State forester of Massachusetts issued publications on various practical phases of forestry and aided land owners to convert their idle lands into woodlots. In Michigan the State forest reserve was being developed, extensive plantings were being made in several localities, and a number of individual land owners were preparing to convert their holdings into managed forests. A commission was appointed to report to the Legislature a forestry policy for the State. Considerable development work and planting was done in the Itasca State Park and in Pillsbury Reserve, in Minnesota. The governor recommended additional legislation pertaining to forestry, but without any great success. The Geological Survey of Mississippi and the National Forest Service were co-operating in a study of the forest conditions within the State, especially of the cut-over long-leaf pine lands. A forest survey of New Hampshire made available information regarding the forests. Dartmouth College was cutting about 1,000,000 board feet of lumber from a tract of 26,000 acres with care for reproduction. The boards having charge of the water supplies of Concord, Nashua, and Hanover are applying forest methods about their sources of supply, etc. New Jersey developed a forest policy, had a State forester, had about 11,000 acres in State reserves, and assisted the private owner in developing his holdings. New York owned 1,347,280 acres in the Adirondack and 92,708 acres in the Catskill reserves, and during the year 1908 purchased Mt. Marcy and a surrounding tract of heavily timbered land and added it to the Adirondack Reserve. The State maintained four forest nurseries in Franklin and Ulster counties and had in 1907 over 500,000 seedlings ready for planting. In Ohio a coöperative plan in tree planting was in effect between the forestry department of the agricultural experiment station and farmers in the State. Oregon organized a forestry commission and provided a system for fire protection through fire wardens. In Pennsylvania the State Department of Forestry had under management 780,000 acres of forests with options on 125,000 acres additional. Tree planting along public highways is provided and important changes in fire protection laws were enacted. The State of Vermont established at the agricultural experiment station a forest nursery from which seedlings for planting within the State were supplied at cost.

FORESTRY IN FOREIGN COUNTRIES. Canada was making marked progress in matters pertaining to her forests. Ontario added materially to the forest reserves and all the forested land in British Columbia, amounting to more than 150,000,000 acres, was placed in reserves by an act of the governor. Efforts were being made to preserve the small amount of forests in Ireland and provisions were made for reforesting large areas. A forest school at Avondale was to have charge of the planting under the Irish Department of Agriculture. It was reported that an Australian firm had secured a concession in Siberia for cutting 30,000,000 feet of timber annually for 10 years, the logs to be shipped to Melbourne for manufacturing into lumber. A royal commission that had been considering reforestation in Great Britain has unanimously reported a plan for the planting of nine million acres, 6,000,000 in

Scotland, 2,500,000 in England, and 500,000 in Ireland, at a cost of \$10,000,000. It is said that this area is available without encroaching on the purely agricultural lands. Great interest was aroused in the planting of rubber trees and other trees of economic importance throughout tropical regions generally, Hawaii alone planting more than 40,000 Ceara rubber trees during 1908 and the past two or three years immediately preceding. In Saxony in 1906 a revenue of \$2,126,037 was obtained from 443,105 acres of government forests. In Germany there were estimated to be 50,000 square miles adapted to forestry, and the annual wood cut is valued at \$60,000,000. The forests of Japan, including private, state, and communal holdings, were said to be about 50,000,000 acres. Japan had a comprehensive system of forest administrators, forest schools in connection with its universities, and a number of secondary ones in other parts of the islands.

FOREST SCHOOLS, ORGANIZATIONS, ETC., IN THE UNITED STATES. Post-graduate work in forestry was offered at Yale University, the University of Michigan, and at Harvard, two-year graduate courses being provided at each institution. A tract of 2,000 acres of forest land recently was given to Harvard as an adjunct to its forest instruction. Undergraduate instruction, varying from brief lecture courses to full four-year work, was offered in nearly all the agricultural colleges, and many other educational institutions, and in many States lectures in forest management are given in connection with the farmers' institute meetings. The Canadian Forestry Association held its ninth annual session in Montreal Mar. 12 and 13, 1908, with Hon. H. H. Price, of Quebec, as president. The Appalachian National Forest Association, the International Society of Arboriculture, and the Society of American Foresters are other associations of national scope. State organizations exist in a number of States, 33 such institutions being in active operation. State forest officers are provided for by 27 States and Territories.

A number of American books on forestry have been published during the year. Among them are *North American Trees*, N. L. Britton and J. A. Shafer; *Forest Trees of the Pacific Slope*, G. B. Sudworth; *Eucalyptus in California*, N. D. Ingham; *Handbook of the Trees of North America and Canada*, R. B. Hough; besides a considerable number of annual reports, bulletins, etc.

FORESTRY ASSOCIATION, AMERICAN An incorporated society, organized to combat the various destructive forces at work in the forest regions of the United States. The scope of this association was enlarged during 1908 so as to include other resources besides forests and the organization now stands for the conservation through rational development and use of all national resources. Beginning with January 1, 1907, the Association assumed the proprietorship and publication of the magazine *Forestry and Irrigation* as its official organ. On September 1, 1908, the title of the magazine was changed to *Conservation*. The membership of the Association is about 8000. The president is Hon. James Wilson, Secretary of Agriculture, and the Acting Secretary, Otto Lueberk, Colorado Building, Washington, D. C. See **FORESTRY**.

FORMOSA. (TAIWAN.) An island in the eastern Pacific, formerly Chinese, since 1895 a

possession of Japan. Area, 13,503 square miles; population (1908), 3,178,884 (1,667,871 male and 1,511,013 female). The natives still living outside the sphere of Japanese administration number about 110,000 and occupy 7,560 square miles. They are divided into about 730 large and small tribes, each occupying its own territory. The population of the principal cities at the end of 1906 was: Dai-Hoku (Tai-pei), the capital, 80,226; Dainan (Tainan), 52,401; Keelung, 16,846; Rokko (Lu-kong), 19,442; Kagi (Chia-i), 19,137; Shokwa (Chang-Hua), 15,584; Shinchiku (Hsin-Chu), 15,149; Gilan (Ilan), 14,793.

PRODUCTION. The mining industry is reported to be prospering. The mineral production in 1907 was as follows: Gold, 42,229 ounces, valued at 1,596,243 yen (1 yen equals 49.8 cents); gold dust, 1,328 ounces and 36,242 yen; silver, 17,136 ounces and 22,713 yen; copper, 47 tons and 28,912 yen; sulphur, 1,305 tons and 29,964 yen; coal, 134,186 tons and 461,390 yen; kerosene oil, 241,080 gallons and 58,401 yen. The Naruwo region, recently brought under Japanese control, is reported to be rich in gold and copper. The principal agricultural products are rice, tea, sweet potatoes, indigo, jute, ramie, opium, etc. Sugar is produced quite extensively. Formosa is, after Japan, the foremost camphor producing country in the world. The total export of camphor in 1907 was 4,121,566 pounds, of which 2,452,933 pounds went to Havre, London, and Hamburg, 1,635,300 to America, and 33,333 pounds to Madras. None of the camphor went to Japan, though 1,079,733 pounds was shipped from Keelung for transshipment at Kobe. The production of camphor by the government camphor monopoly was 5,388,918 pounds in 1907, against 4,040,838 in 1906. The contract for the export of camphor from Japan and Formosa had been held by a British firm until April, 1908. It was then discontinued, the Japanese government intending to enter the foreign markets either direct or through the agency of a Japanese firm. The production of camphor oil in 1907 was 6,710,390 pounds, against 3,610,645 pounds in 1906. Hitherto all the camphor oil was shipped to Kobe to be converted into refined camphor, but the budget of 1908 provided for the erection of a refinery at Dai-Hoku.

In 1908 irrigation works were started. Their construction was to extend over a period of 18 years and involve a cost of 30,000,000 yen. These works will be confined mainly to the plains in the western half of Formosa. It was estimated that with a proper system of irrigation the southern half of the western lowlands would be able to supply Japan with all the sugar it consumes, about 500,000 tons, or seven times the amount now produced on the island. It was also estimated that the productivity of the present rice fields would be increased by from 50 to 75 per cent., and that in addition 100,000 acres of land now unproductive could be converted into rice fields. The works were expected to pay for themselves, even during the period of construction, from water and land taxes and charges for electric power.

COMMERCE AND COMMUNICATIONS. The imports and exports of merchandise in 1907 amounted to 30,971,000 and 27,376,000 yen respectively. The imports are mainly textiles, metal goods, lumber, salt, tobacco, fruit, and

opium. The exports are mainly tea, rice, sugar, camphor, camphor oil, ramie, and jute. The trade with the principal countries of origin and destination in 1907 was as follows, in yen:

From and to	Imports	Exports
Japan.....	19,750,000	17,635,000
China.....	4,334,000	2,982,000
Hong Kong.....	208,000	2,082,000
Great Britain.....	1,757,000	504,000
United States.....	1,276,000	4,090,000

The trunk railway from Keelung, in the north, to Hakoko, in the south, 334 miles, was completed in May, 1908. Japan took over from China, in 1895, 62 miles of completed line. The Japanese programme of construction was laid down in 1899 and called for the completion of the railway in nine years at a cost of 28,800,000 yen. The actual cost was 3,800,000 yen below the estimates. The Formosa Sugar Refining Company had a concession for constructing 450 miles of branch lines, of which 90 miles were reported completed in August, 1908. The length of telegraph line is over 1100 miles.

FINANCE, ETC. The budget for 1908-9 balanced at 33,871,328 yen. The ten-year programme of public works, inaugurated in 1899, involved the expenditure of 28,800,000 yen on railways, 6,000,000 yen on repurchase of land rights, 2,000,000 for harbor construction, 3,000,000 for land surveys, and 1,200,000 on public buildings. The undertakings were carried out by floating bonds to the amount of 34,508,500 yen. By the middle of 1908 the volume of the bonds was reduced to 32,900,000 yen, a part having been paid off from the proceeds of the works. The Japanese garrison numbers about 12,000 men. The Governor-General in 1908 was Gen. S. Sakuma.

HISTORY. The campaign against the aborigines in the northeast of the island was continued in 1908. The force employed by the Japanese was 1086 constables and 4930 Aiyu—the latter being enlisted from among the natives. The Japanese lines of wire entanglements, 450 miles in length, were pushed forward, and towards the end of 1908 the aborigines were reported to have lost all their cultivated fields and to have been confined to the mountain regions. Being unable to obtain arms, ammunition, or salt, it was thought that they would soon have to submit. The annual cost of the campaign has been about 2,000,000 yen.

FORT, JOHN F. Governor of New Jersey. See NEW JERSEY.

FOUNDATIONS. Galvanized steel beams for grillages during 1908 formed the subject of experiments for the purpose of devising a protection against rust and corrosion, as such forms of foundation work are usually in concealed and wet places. Galvanizing the beams by the hot process after the shop work had been completed was found practical, and it was observed that the concrete adhered satisfactorily to the beams. Grillages built as experiments, and surrounded by concrete, showed, when broken open after six months, perfectly close and firm contact between the metal and the concrete. Steel sheet piling, was successfully used in sinking through quicksand, by the Pittsburg Plate Glass Co., at its plant in Crystal City, Mo. To lay the foundations, eight pits 22 feet by 26 feet, and about

40 feet deep were found necessary, clay being the material encountered except for a stratum of quicksand 20 feet below the surface. Sheet piling consisting of 15 inch steel channels, driven in 40 foot lengths, and locked together, were used and proved absolutely watertight.

FOWLER, CHARLES HENRY. An American clergyman, bishop of the Methodist Episcopal Church, died at his home in New York City, on Mar. 20, 1908. He was born in Burford, Ontario, Canada, on August 11, 1837, graduated at Genesee College (now Syracuse University) in 1859, studied law that year in Chicago (but never practiced), and two years afterward graduated at the Garrett Biblical Institute. He entered the Methodist Episcopal ministry in the Rock River (Illinois) Conference, in 1861, and for the ensuing twelve years held pastorates in Chicago. He was president of the Northwestern University in 1872-76, and editor of the *Christian Advocate* in 1876-80, when he became general missionary secretary of his church. In 1884 he was elected a bishop. He visited South America in 1885, and organized there an efficient missionary system; and in 1888, during a tour around the world, he founded the Pekin University, and the Nankin University, and established the first Methodist Episcopal church in St. Petersburg. He also had a part in founding the Nebraska Wesleyan University, at University Place, Neb., and the McClay College of Theology in Southern California. In 1898 he was fraternal delegate to the Wesleyan General Conference in England, and in the same year proposed the famous Twentieth Century Thank Offering of \$20,000,000, an amount which was actually raised by special subscriptions by the end of 1902, and thereafter was increased by another million dollars.

FRANCE. A republic of western Europe. Area, including Corsica and smaller islands, 207,129 square miles; population in 1906, 35,252,267, against 38,961,945 in 1901. In 1906 there were 306,487 marriages, 10,573 divorces, 806,847 births, and 780,196 deaths; in 1907, 314,903 marriages, 10,938 divorces, 773,969 births, and 793,889 deaths. The excess of births over deaths was 72,398 in 1901; 83,944 in 1902; 73,106 in 1903; 57,026 in 1904; 37,120 in 1905; 26,651 in 1906; and changed into a deficit of 19,920 in 1907. The tendency to a decrease is most marked in the southern departments. In 1907 there was an excess of births in 29 departments, against 42 in 1906 and 43 in 1905. These are mostly in the north, in Bretagne, on the eastern frontier, and Corsica. But in these also the excess is diminishing each successive year. In 1907 the birth rate per 1000 of population was 19.7, against 21.6 in 1906. The diminution in the birth rate is not due to a diminution of marriages. In 1898 the marriage rate was 7.6 per 1000 population; in 1906, 7.8; in 1907, 8.0. This marriage rate is not less than in other European states. The depopulation is due to the diminished fertility of marriages, the causes of which have been sought by statisticians and publicists for years. The *République Française* of Nov. 29, 1907, insists on the necessity of abolishing the law of equal division of inheritances, which has had the effect of restricting families at first to the two-child system, and now to the one-child system. Among the peasants particularly there is an intense aversion to the division of the land. The

newspaper recalls that fact that in 1815 Castle-reagh said that there was no need of fighting the French, for with their inheritance law they would become extinct in a hundred years. The Prussian *Statistische Korrespondenz*, in discussing the above proposal, doubts its remedial effect, for it may be too late to change by law the ingrained habit of equal division. In the first half of 1908 the births exceeded the deaths by 11,066, against an excess of 55,007 deaths in the first half of 1907. Births showed an increase of nearly 9,000, and deaths decreased about 58,000. The excess of births is thus mainly due to a decrease in deaths. The marriages numbered 162,495, against 154,081 in the first six months of 1907. The principal cities, with the population in 1906, are: Paris, the capital, 2,763,393; Marseilles, 517,498; Lyons, 472,114; Bordeaux, 251,947; Lille, 205,602; Toulouse, 149,438; St. Etienne, 146,788; Nice, 134,232; Nantes, 133,247; Havre, 132,430; Roubaix, 121,017.

EDUCATION. Primary education is free and compulsory from 6 to 13 years of age. By the law of July 8, 1904, all congregationist teaching is to be suppressed within ten years. Of infant, primary, and higher schools there were in 1905-6 in France and Algeria 67,845 public lay schools, with 112,465 teachers and 4,476,302 enrolled pupils; 11,240 private lay schools, with 28,853 teachers and 761,452 pupils; 600 public clerical schools, with 1,049 teachers and 51,662 pupils; and 2,252 private clerical schools, with 9,018 teachers and 277,466 pupils. In the evening courses of instruction for adults there were enrolled in 1906-7 about 718,000 pupils, but only 59,000 attended regularly. Popular lectures were attended by over 100,000 auditors. The number of primary normal schools was 83 for men, with 3,899 students, and 82 for women, with 5,169 students in 1906. For secondary instruction for boys there were in 1907 in France and Algeria, 339 public lyceums and colleges with 96,462 pupils, 273 private lay institutions with 21,248 pupils, and 336 private clerical institutions with 43,327 pupils; and for girls, 171 lyceums, colleges and courses, with 34,262 pupils. The higher educational institutions of the State, including universities and special schools, had in 1907 38,197 students, of whom 16,609 were in the University of Paris. There are also a number of private universities, mostly Catholic, the Free School of Political Science at Paris, and a considerable number of special and technical schools under the various ministries.

AGRICULTURE. The area and production of cereals in France in 1907 and 1908 are shown in the following:

	Area	Production
	<i>Acres.</i>	<i>Bushels*</i>
Wheat:		
1908 (preliminary)...	16,100,900	309,157,000
1907 (revised)	16,253,200	381,227,000
Rye:		
1908 (preliminary)...	3,083,300	51,294,000
1907 (revised)	3,064,300	56,463,000
Maslin:		
1908 (preliminary)...	362,000	6,768,000
1907 (revised)	356,400	7,053,000
Barley:		
1908 (preliminary)...	1,794,900	41,474,000
1907 (revised)	1,761,500	44,928,000
Oats:		
1908 (preliminary)...	9,586,700	332,335,000
1907 (revised)	9,565,300	352,715,000

* Bushels of weight: Wheat, 60 pounds; rye, 56 pounds; maslin, 58 pounds; barley, 48 pounds; oats, 32 pounds.

The area devoted to non-cereal crops in 1907 and 1908 is shown in the following:

Crop.	June 15, 1908	June 15, 1907
Potatoes	3,859,000	3,691,000
Sugar beets	539,000	544,000
Distillery beets	123,000	117,000
Fodder beets	1,546,000	1,534,000
Artificial meadows (clover, alfalfa, and sainfoin)	7,345,000	7,350,000
Temporary meadows (grasses in rotation)	711,000	574,000
Natural meadows	11,758,000	11,736,000
Annual fodder crops (vetches, peas, etc.)	1,677,000	1,563,000
Vineyards	4,349,000	4,384,000

The production of sugar beets in 1907-8 was 5,341,400 tons; in 1908-9, 5,800,600 tons.

The wine production of France in 1907 was 66,070,000 hectolitres (1 hectolitre = 26.418 U. S. gallons), against 52,079,000 hectolitres in 1906. The chief producing departments are the seven departments in the neighborhood of Marseilles the production of which is stated to have been in gallons as follows:

Department	1906	1907
Aude	113,862,192	221,469,127
Bouches du Rhône ..	23,620,604	35,658,373
Gard	58,870,102	114,863,134
Hérault	216,619,400	353,862,696
Pyrénées Orientales..	47,484,217	119,430,767
Var	35,612,134	46,330,212
Vaucluse	18,237,474	22,894,614

The yield per hectare varied from 1954 gallons in Hérault and Pyrénées Orientales down to 713 gallons in Vaucluse. Based upon prices realized by growers, the value of the 1907 crop was \$215,647,320, of which \$17,939,839 stands for 29,054,096 gallons of superior wines, and the remainder for 1,716,315,618 gallons of light wines. Partial reports for 1908 stated that in the champagne districts of Rheims, Epernay, and Châlons the crop proved a complete failure, owing to heavy rains in July and resulting mildew; in the Gironde, where the vintage amounted to 119,964,284 gallons in 1907, that of 1908 was reduced to 85,877,547, due to spring frosts and plant diseases, but owing to exceptionally fine weather during the period of vintage the classed growths of Médoc showed promise of excellent results; in Saône-et-Loire the vintage was estimated at between 1,700,000 and 2,000,000 hectolitres, against 1,400,000 in 1907—a substantial increase, contrasting with the heavy decline in the total yield of France, which was estimated at 55,030,000 hectolitres. In January, 1908, the stock of wine on hand from vintages earlier than 1907 was 219,159,706 gallons. The stock on hand of Bordeaux wines in the Gironde alone was at least 132,336,054 gallons on Nov. 1, 1908.

The serious disorders occurring in the wine districts of southern France in the summer of 1907 led to the adoption of more stringent laws against adulteration. The Ministry of Agriculture also caused an investigation to be made in regard to the causes of the wine crisis. The following are, in brief, the main features of the report submitted by Professor Daniel, of the University of Rennes. He traced the beginning of present troubles back to 1850, when American vines were introduced in the Midi, in order to

combat the ravages of the oidium fungus. The experiment was hailed as a great success, the principle that only allied varieties should be grafted was violated, the French vines were generally grafted on the hardier American stock, and the vineyards were "reconstituted." To add to the popularity of reconstitution it was found that the grafted vines were two and three times as prolific as the older vines. Soon, however, it was discovered that the new wine was inferior in quality to the old product, and moreover would not keep so well. Formerly the merchants would buy up all the wine in seasons of plenty and store the surplus above immediate needs in their cellars, where age improved its quality and added to its value. Now this was no longer possible; the wine had to be marketed soon, and in seasons of plenty, it could not be sold at remunerative prices. At the same time, the consumption of the ordinary wines had greatly decreased, partly due to the making in seasons of scarcity of artificial wines from dried raisins, sugar, and other ingredients, some of which were unwholesome, if not actually poisonous. As a result there was in recent years, and particularly in 1907, a glut of wine in Southern France. Professor Daniel urged as a radical remedy, the digging up of the reconstituted vineyards and the replanting of them with native stock. In the opinion of the French internal revenue departments, the crisis of 1907 was not due to a general overproduction but to local and temporary overproduction.

The production of cider in 1907 was 3,360,219 hectolitres, about 88,766,885 gallons, against 22,301,597 hectolitres in 1906. This was the lowest figure ever recorded, with the exception of 1871. The average annual cider production for the decade 1897-1906 was 430,275,000 gallons. The production of olives in 1906-7 was 89,768 tons, against 85,182 tons in 1905-6; of olive oil (estimated), 10,772 and 10,222 tons. At the end of 1905 the numbers of farm animals were: Cattle, 14,315,552; horses, 3,169,224; asses, 365,181; mules, 198,865; pigs, 7,558,779; sheep-17,783,209; goats, 1,476,957.

FORESTRY. About 8,400,000 hectares (1 hectare = 2.47 acres) are under forests. The State forests are under scientific control. Private cleared lands, such as summits and mountain sides, dunes and moors, if replanted with trees, are exempt from taxation during 30 years. All other lands replanted are exempt to the extent of three-fourths of the ordinary tax for a like period. The uprooting of trees and the clearing of wooded lands require the assent of the sub-prefects, who may deny the application if the preservation of the woods is necessary for the maintenance of the soil upon mountains and slopes, for the defense of the soil against erosion and rivers, for the existence of springs and watercourses, for the defense of the national territory in the frontier zone, and for the public health.

MINING AND METALS. The production of pit-coal and anthracite in 1907 was 36,168,389 tons, a gain of 2,710,549 tons over 1906; of lignite, 761,861 tons. The production of ores in 1906 was as follows: iron, 8,481,823 tons; lead and silver, 11,795; zinc, 53,466; copper, 2,547; antimony, 18,567; arsenic, 6,534; manganese, 11,189; salt, 1,335,420. The output of the quarries in 1906, including building stone, slate, cement, phosphates, etc., was valued at 238,814,000 francs. In 1906 there were in operation 60 smelting works, with 122 blast furnaces. On

Dec. 31, 1908 there were 107 furnaces in blast in France as compared with 111 on Dec. 31, 1907. In 1907 the production of pig iron was 3,606,288 tons, against 3,314,162 in 1906; worked mild steel, including rails, merchant steel plates, forgings, and moldings, 1,554,786 tons, against 1,683,567 in 1906; steel ingots, 2,653,613 tons, against 2,371,377 in 1906; steel blooms and billets, 1,374,479 tons, against 1,052,167 in 1906; wrought iron and steel, including merchant iron and steel obtained by puddling, charcoal process and reheating, and sheets, 687,249 tons, against 747,963 in 1906. The export of bauxite, mainly from the neighborhood of Marseilles, amounted in 1907 to 110,915 tons. In 1908 there was found near Bétune, Pas-de-Calais, petroleum which on analysis was found superior in carbides and naphtha to the best Russian product.

MANUFACTURES. In 1908 there were in France 6,731,316 cotton spinning spindles, which consumed during the year ending Aug. 31, 1908, 950,259 bales of cotton (740,512 American, 127,356 East Indian, 58,495 Egyptian). The consumption of wool in 1907 was estimated at 137,000,000 pounds, about 40 per cent. of the domestic product being exported. In 1906-7 there were 273 sugar factories, employing 36,615 men, 2,078 women, and 1,370 children. The output of refined sugar in 1906-7 was 682,851 tons; in 1907-8, 704,100 tons; in 1908-9, 746,500 tons. The alcohol production in 1906 was 2,709,831 hectolitres; in 1907, 2,514,810 hectolitres. The number of ships built in 1907 was 52, of 113,345 tons. The shipbuilding on hand on Sept. 30, 1908, was 44,803 gross tons, against 107,955 on the same date in 1907.

FOREIGN COMMERCE. The general imports and exports of France in 1907 amounted to 7,574,600,000 and 7,256,100,000 francs respectively. In the special trade (imports for consumption and exports of domestic produce) imports of merchandise amounted to 6,047,648,000 francs and exports of merchandise 5,542,030,000 francs, against 5,627,200,000 and 5,265,500,000 respectively in 1906. The special imports and exports of merchandise by great classes were in 1907 as follows, in francs:

	Imports	Exports
Food products.....	1,001,887,000	749,280,000
Raw materials.....	3,878,446,000	1,532,010,000
Manufactures.....	1,167,315,000	2,852,387,000
Postal parcels.....		408,353,000

The principal imports (special trade) in 1907 were (add 000): Cattle, 78,500 francs; butter and cheese, 65,305; coal and coke, 429,104; raw coffee, 103,602; copper, 155,357; raw cotton, 440,686; cotton yarn, 25,984; cotton manufactures, 67,151; fish, 59,500; raw flax, hemp, and jute, 179,800; fresh and preserved fruits, 42,162; oleaginous fruits and seeds, 272,793; grain and grain products, 225,110; hides and skins, 153,058; tanned or curried hides, 50,900; machinery, 224,240; nitrate of soda, 69,138; petroleum and vegetable oils, 149,707; raw silk, 441,500; silk manufactures, 56,176; timber, 183,520; wine, 104,354; raw wool, 580,390; woolen yarn, 9,941; woolen manufactures, 44,220. The principal exports of domestic produce in 1907 were, in 1000 francs: Apparel, 150,378 francs; brandy and other spirits, 46,127; butter and cheese, 69,889; chemicals, 132,548; copper, 43,200; raw cotton, 67,497; cot-

ton manufactures, 352,209; earthenware and glassware, 89,052; fruit, 50,071; haberdashery, small fancy ware, toys, etc., 264,700; grain and flour, 21,000; hides and skins, 122,409; tanned hides and skins, 106,373; leatherware, 75,734; machinery, 93,970; metal wares and tools, 118,800; millinery, 158,781; paper and manufactures thereof, 83,155; raw silk, 197,349; silk manufactures, 355,581; raw sugar, 42,856; refined sugar, 50,671; wine, 228,025; timber, 67,693; raw wool, 266,242; woolen yarn, 70,149; woolen manufactures, 245,503. The special trade with some of the principal countries of origin and destination in 1907 was as follows, in francs:

From and to—	Imports	Exports
Great Britain.....	883,200,000	1,368,800,000
Australasia	179,000,000	8,100,000
Canada	6,334,000	13,381,000
Algeria	290,600,000	392,700,000
Belgium	426,600,000	860,900,000
Germany	638,200,000	649,700,000
Switzerland	117,200,000	351,600,000
United States.....	670,900,000	395,500,000
Spain*	171,200,000	131,000,000
Switzerland*	109,500,000	308,800,000
Italy*	181,900,000	247,100,000
Russia*	302,900,000	66,900,000
Turkey*	115,000,000	59,100,000
Austria-Hungary*	76,700,000	36,700,000

* 1906

During the first ten months of 1908 the imports were reported to have declined about 2 per cent. and the exports about 7 per cent., as compared with the same period in 1907.

The gold and silver movement in France, 11 months ended Nov. 30, was as follows:

	Imports	Exports	Excess
Gold	Fr. 885,968,000	Fr. 22,464,000	Imp. Fr. 863,504,000
1907	416,334,000	142,458,000	Imp. 273,876,000
Silver	156,509,000	160,465,000	Exp. 3,956,000
1907	161,723,000	191,436,000	Exp. 29,713,000

Attention was generally attracted to the large amounts of gold that were being acquired by France, and its effect on the political and banking situation was widely discussed.

COMMUNICATIONS. The tonnage entered in the foreign commerce in 1906 was 24,470,964 (6,029,274 French), and that cleared, 24,603,504 (6,132,521 French). The merchant marine on Jan. 1, 1907, consisted of 15,488 sailing vessels, of 877,055 tons, and 1,611 steamers of 723,487 tons. The railways in operation on Dec. 31, 1907, aggregated 24,997 miles of principal lines and 4,851 miles of local lines. The French and Spanish governments have made arrangements for the construction of a Trans-Pyrenean line, which will greatly reduce the distance of travel between the two countries. The length of telegraph lines in 1906 was 114,679 miles. Letter-telegrams, transmitted at low rates during the night hours, were introduced on Dec. 7, 1908.

GOVERNMENT. The President in 1908 was Armand Fallières, whose term is Feb. 18, 1906-1913. The Cabinet in 1908 was as follows: Premier and Minister of Interior, G. B. E. Clémenceau; Justice and Worship, A. Briand; Foreign Affairs, Stephen Pichon; Finance, M. Caillaux; War, Gen. Picquart; Marine, A. Picard; Public Instruction and Fine Arts, G. Doumergue; Public Works, Posts, and Telegraphs, L.

Barthou; Commerce and Industry, J. Cruppi; Agriculture, M. Ruau; Colonies, M. Milles-Lacroix; Labor and Social Provision, R. Viviani.

FINANCE. The general budget for 1908 estimated the revenue at 3,908,460,516 francs, and the expenditure at 3,910,283,358; the special budget balanced at 158,735,975 francs. The principal estimates of revenue were: Direct taxes, 561,655,716; registration, 613,217,900; stamps, 210,619,700; customs, 481,465,000; taxes on beverages, 432,776,400; sugar, 155,204,000; tobacco, match, and gunpowder monopolies, 516,192,600; posts, telegraphs, and telephones, 349,665,200; domains and forests, 59,106,882. The principal estimates of expenditure were: Public debt, 1,262,523,153; war, 779,875,128; navy, 319,932,722; public instruction, 290,417,044; colonies, 98,269,689; public works, posts, and telegraphs, 245,557,373; cost of collection of taxes and administration of monopolies, posts, telegraphs, state domains, etc., 534,018,767. The consolidated public debt stood on Jan. 1, 1908, at 29,058,824,704 francs; the floating debt, at 1,102,894,400 francs.

ARMY. The French army consists of two parts, the Metropolitan army and the Colonial army. Military service is obligatory and universal for all citizens between the ages of 20 and 45 years, the only exceptions being those for physical disability. The period of active service in the first line is two years, followed by eleven years in the reserve, six years in the territorial army, and finally by six years in the reserve of the territorial army. The organizations of the Metropolitan army comprise 163 regiments of infantry and 30 battalions of chasseurs à pied; 79 regiments of cavalry (13 cuirassier, 31 dragoons, 21 chasseurs à cheval, and 14 hussar); 40 regiments of field artillery; 14 batteries of mountain artillery; and 16 battalions of garrison artillery; 6 regiments of engineers and a railway regiment. There are 20 army corps in the active army; and in addition there are 36 divisions of Reserve troops; 36 divisions of Territorial troops; 38 battalions of military Customs Corps; about 22,000 Gendarmerie, about one-half of whom are mounted, and the Garde Republicaine of about 3,000 men, similar to the Gendarmerie but doing duty in Paris. The Colonial army, formed by voluntary enlistment or voluntary transfer from the Metropolitan army, consists of 12 regiments of infantry and 3 regiments of artillery permanently stationed in France during peace; and 8 regiments, and 3 independent battalions of infantry, 4 mixed regiments (field, mountain and garrison), 1 division field batteries, and 1 battalion garrison artillery, with stations abroad. There are also a number of native corps of which the most important are the 20 battalions of Annamite and Tonkinese, and the 15 battalions of Senegalese Tirailleurs.

The total authorized strength of the active Metropolitan army in 1908 was 576,779 of all ranks, to which must be added 27,580 of all ranks for that part of the Colonial army stationed in France. The field army is estimated at 1,290,000 combatants, while depot troops, all fully trained, number about 626,000, and there are available about 700,000 additional (*ersatz*) men to make good losses in the field. This gives an aggregate of 2,616,000 trained men available in time of war.

The French infantry is armed with the Lebel magazine rifle; the cavalry with the Lebel car-

bine; and the field artillery with the Model 97 shielded rapid fire gun. The field artillery was increased in 1908 so as to have 120 guns to each army corps instead of only 96 as formerly. The field gun was much improved by increasing the powder charge, reducing the length of the bore, and making the shield larger and lighter, thereby decreasing the weight. Each infantry battalion and cavalry brigade was provided with two machine gun detachments. Experiments were conducted with an automatic rifle which promised great success. Experiments were also carried on with motor vehicles for transportation purposes, with the result that light motor trains are considered to have 20 times the efficiency (carrying 5 times the weight to 4 times the distance) of horse drawn trains. The cost of the army per head of population is about \$4.25 per year, being higher than that of Germany, (about \$2.50) or Great Britain (about \$3.50). The discipline and training of the army is said to have reached a higher degree of efficiency in 1908 than ever before in its history.

NAVY. At the beginning of 1908 the effective navy consisted of 22 first-class battleships aggregating 253,880 tons; 10 second-class battleships, 74,210 tons; 6 armored gunboats, 9300 tons; 21 armored cruisers, 193,760 tons; 4 protected large cruisers, 30,100 tons; 21 protected small cruisers, 67,820 tons; 7 gunboats, 2096 tons; 72 destroyers, 27,547 tons; 246 torpedo boats, 24,705 tons; total, 409 ships, of 683,473 tons, besides 48 submarines, and 5 convertible cruisers ranging from 8300 to 15,000 tons. There was in 1907 a decrease of 48,462 tons, due to the loss of the battleship *Jéna* and the striking off the list of some old cruisers. The crews numbered 58,600. There were under construction 7 battleships, 125,000 tons, and 4 armored cruisers, 54,200 tons, besides minor craft.

The year 1908 was an unhappy year for the French Navy. Magazine and boiler explosions, wrecks, submarine tragedies, gunnery accidents were leading events of the history of the few years previous. Three serious gunnery accidents had taken place on the *Couronne*, all attended with loss of life, on April 20th, 1906, Aug. 2d, 1907, and Aug. 12th, 1908; and one on the *Latouche-Tréville* on Sept. 22nd, 1908. Naval officers complained that the guns were badly designed, and were ill adapted to rapid loading; that the powder lacked stability; and that the ammunition was very defective. There was no uniformity in the projectiles; and charges were very carelessly put up. All guns in service, and being built, were designed for "B" powder; and all guns were designed and built by the Colonial Artillery. It was claimed however that "B" and "AM" powders were ballistically the best in the world. Criticism of the French Navy revealed the fact that auxiliaries were lacking in the way of scouts, repair, depot, and mining ships. There was a permanent shortage in personnel; most battleships were half manned; and, in case of emergency, not more than three out of the nine coast guard ships at Cherbourg could be sent to sea. Ammunition and stores of all sorts were deemed insufficient for war purposes; and neither Toulon nor Brest possessed adequate docking facilities.

M. G. Thomson, Minister of Marine, resigned Oct. 19th (see below *History*), after a vote in the French Chamber of Deputies deploring the negligence in the Navy Department, as indicated by the *Jéna* and subsequent disasters. M. Pi-

card, his successor, declared, in November, that France must regulate her armament by that of Germany, and not by that of England; that a new battleship programme would soon be submitted to the Chamber, providing for the laying down of two or three battleships a year. He promised to hasten construction work. The refrigeration of battleship magazines was occupying his attention. He intended renewing the material in the dockyards; simplifying and decentralizing administration as much as possible; and increasing the cohesion among the various departments.

Bizerta, as an advanced naval base, was being used by the fleet for docking, repairing, coaling, and filling up with stores and ammunition. Much attention was beginning to be given to gunnery, on account of American and British records. At battle practice by the Brest cruiser squadron against the target ship *Tonnerre*, from 30 to 33 per cent. of hits was made at from 6000 to 4000 metres. The battle practice for large calibre guns took place in the Mediterranean against the Liserot rock; 40 to 57 per cent. of hits was made by the battleships of the Mediterranean fleet.

HISTORY.

PARLIAMENT AND THE MINISTRY. Changes took place in the ministry early in the year, owing to the death of M. Guyot Dessaigne, Minister of Justice. His place was taken by M. Briand, who retained the Ministry of Public Worship, but transferred the Ministry of Public Instruction to M. Doumergue, whose place as Minister of Commerce was taken by M. Cruppi, Vice-President of the Chamber. Parliament re-assembled on Jan. 14, after the Christmas holidays. Among the measures before it the following may be mentioned, and the more important of them will be discussed in succeeding paragraphs: The Church Property or "Devolution" Bill; the Income Tax Bill; old age pensions; the budget; the Army Bill; bills for the protection of art treasures, especially in churches; for the formation of an extraordinary commission to draw up a plan of naval reorganization; for an appropriation for the improvement of the port of Havre and the estuary of the Seine; for amnesty to offenders in the wine growing uprising in 1907; for changing judicial separation into divorce after three years on the application of either party; and for the purchase of the Western Railway. Of these the Army Bill, the Devolution Bill, the measures providing for the budget, for the protection of art treasures, for the commission on naval reorganization, for the improvement of the port of Havre and the Seine estuary, for the Franco-British exhibition, for the amnesty to the wine growers, and for the purchase of the Western Railway were passed. The Church Property Bill amended the Separation Law by giving only to direct heirs the right of legal action for recovery of property bequeathed to the Church. It was carried after a debate which lasted six weeks in the Chamber, but was so amended as to permit property bequeathed for the purpose of paying for masses for the dead to be used for that purpose. It was designed to prevent the embarrassment of the government by law suits brought against the departments and communes, as had been threatened by the Clericals. The Army Law reduced the time of training for the reservists to two periods, one of 23 days and the

other of 17 days, and for the territorial troops to one week. An attempt had been made to carry an amendment to the amnesty measure, extending amnesty to the insubordinate civil servants, the anti-militarists and the anti-patriots, but this was firmly opposed by the ministry and rejected by a majority of 460 to 73.

THE INCOME TAX BILL. The debate on the Income Tax Bill began Jan. 20, but though some of the chief articles were passed, an agreement on it could not be reached, and final action was deferred. It encountered serious opposition, not only in Parliament, but in the country. In the latter part of March a meeting of protest was held at the instance of the Agricultural and Industrial Association which was said to represent a million and a half French taxpayers. The meeting denounced the present measure, and proposed as an alternative a gradual reform of the system of taxation, the reduction of the land taxes and the making up of the revenue by the taxation of foreign securities. Among other objections two serious defects were alleged against it. In the first place, it added to the taxes on the different sources of revenue this supplementary and all inclusive tax; and in the second place, it did not provide an effective means of assessment. On this latter point it was argued that the government must either be left to the mercy of the false statements of individuals as to their income, or it must resort to inquisitorial methods. It was pointed out that the tax would exempt from 9,500,000 to 10,000,000 persons, and that in taxing progressively incomes of from 5000 francs upward, it discriminated against the well-to-do, confiscated individual fortunes, and was in fact an instance of class legislation. Some favored in place of it a combination of the Italian and British income tax systems, while others proposed a reform of the existing system. It was generally admitted that the present methods of taxation were in urgent need of reform.

THE OLD AGE PENSIONS BILL. The two houses of Parliament disagreed on the Old Age Pensions Bill, which had been voted on by the Chamber of Deputies in 1906. In March, 1908, the Chamber, by a vote of 474 to 66, adopted a resolution calling on the government to obtain from the Senate a favorable vote on the measure. In June, M. Clémenceau, the Premier, sent a note to the Senate Commission which had the matter in charge, suggesting the age of sixty-five for the beginning of the pensions, the inclusion of farm hands and domestics among those entitled to pensions, and the provision that the pensions should not fall below 350 francs, or when combined with income received from other sources exceed a total of 600 francs for the first fifteen years after the bill became a law, and a total of 800 francs for the next fifteen years. No solution had been reached at the close of the year. The measure, like the income tax proposal of the government, encountered severe criticism from the opposition. Among the arguments brought against it were that it did not provide for any coöperation on the part of the recipients of the pensions in the shape of compulsory saving. The non-Socialist Republicans objected to it especially on this ground, fearing a tendency to pauperize the working classes. They declared that the example of England was not applicable, since already in France the law providing for assistance to the aged, infirm, and incurable,

based on the principle of obligation, had imposed a charge of 100,000,000 francs a year on the budget of the state and of the commune. For the most part the arguments took the familiar lines, that the measure was socialistic and that it tended to discourage individual thrift and industry. Some recommended as an alternative the Belgian system, whereby the state contributes to societies of mutual aid already in existence, apportioning the subsidies according to the importance of the work done by these societies. The Belgian law is merely permissive and not compulsory.

THE PURCHASE OF THE WESTERN RAILWAY. The question of the purchase of the Western Railway, for which a bill was introduced in Parliament, was long debated. The debate closed on June 25, and the bill was passed in the Chamber, but encountered serious opposition in the Senate, partly on the ground that the money was needed for the old age pension scheme, and partly from alleged vices of the measure itself. The government, however, received in the final division a majority of 37, and the bill became a law on July 12. A bill was then introduced by the Minister of Public Works, sanctioning provisional arrangements for the running of the road till the government could assume its management in 1909, and was passed by the Chamber. The government was accused by the opposition of having brought undue pressure to bear on the Senate, in order to secure the passage of this measure. Many favored the alternative proposed by M. Ch. Prevet in the Senate, namely, a reorganization and an exchange of lines between the state system and the Western and Orleans Railways, to insure greater uniformity and coherence, and further railway development. The purchase was criticised by the opposition as an unwise and dangerous step, likely to lead to bad management of the road.

ECHOES OF THE DREYFUS AFFAIR. In February a monument was unveiled in memory of M. Scheurer-Kestner, who was one of Dreyfus's earliest advocates, and as vice-president of the Senate, had successfully exerted himself to bring about the reopening of the Dreyfus case. Premier Clémenceau, who delivered the principal speech of the day, warmly praised the courage of men like Scheurer-Kestner, who dared to be loyal to the truth, in the face of bitter partisanship, and hostile public opinion. The cause for which Scheurer-Kestner had fought was now completely triumphant, declared M. Clémenceau. On March 10, the Chamber voted the restoration of Joseph Reinach, a prominent Dreyfusard, to his rank as captain in the army. Other officers of the reserves and of the territorial forces who had been cashiered for similar reasons were also restored. On Mar. 19, an appropriation was voted for the removal of Emile Zola's ashes to the Panthéon, after a discussion, in the course of which M. Barrès attacked Zola as a traducer of the national honor, notably on his novel of the Franco-German war, *Débâcle*, and M. Jaurès pronounced a panegyric on him. The transfer of the ashes was accomplished on April 2, without any disturbance in the streets, owing, perhaps, to the quiet and almost secret manner in which it took place. Ceremonies were held in the Panthéon on June 4, and attended by the President and Cabinet, and many prominent persons, including Dreyfus. At their close, a journalist named Gregori attempted to assassinate

Dreyfus, but succeeded in only slightly wounding him. The trial of Gregori took place in September, and among the spectators were many Dreyfusards and anti-Dreyfusards. The president of the court ruled that no discussion of the guilt or innocence of Dreyfus would be permitted. Nevertheless, the passions which the famous case had aroused were stirred again by the speeches of the prisoner and his counsel. The prisoner declared that he had fired his shot as a protest against the impudent act of the government in placing the ashes of Zola in the Panthéon, and because this public demonstration was an abuse of the good faith of the country. Gregori's counsel made a violent speech against the Republican administration, in the course of which all the bitterness of extreme anti-Dreyfusism came out. The jury declared Gregori not guilty either of homicide or of deliberate wounding. The act was apparently regarded as belonging to the class of *crimes passionnels*, toward which French juries are apt to be lenient. The excitement over the affair soon quieted down. On the reassembling of Parliament in October, one of the deputies brought up the question of the attacks on the Court of Cassation, for the decision which had been handed down in the Dreyfus case in 1906, and M. Briand, Minister of Justice, pointed out the folly of these attacks and their evident attempt to revive the affair. M. Biétry, having used violent language and refused to withdraw it, was subjected to a vote of censure and temporary exclusion from the Chamber.

TROUBLE WITH THE TRADE UNIONS. On the occasion of a strike among the glass workers of Draveil, the gendarmes were attacked and opened fire, killing one striker and wounding ten workmen. Four of the gendarmes were wounded. Thereupon the General Confederation of Labor in a public announcement characterized it as another crime of the Clémenceau Ministry, and called a meeting on June 6. At this meeting, after speeches were made by several officers of the General Federation of Labor, a general strike was ordered for twenty-four hours, as a protest against the Draveil affair. At the end of the meeting there was some rioting, in the course of which thirteen persons were wounded. In the Chamber the Socialists moved a vote of censure, but it was defeated. (For a discussion of the relation between revolutionary trade unionism and socialism, see the article on **SOCIALISM**.) On July 27, the Federation of Building Trades declared a twenty-four hour general strike on account of the Draveil affair. On July 30, many strikers went to Draveil, and conflicts with the troops took place in the streets of Villeneuve, Saint Georges, and on the railway line, in the course of which sixty strikers and a number of soldiers were wounded and three strikers killed. It was thought that this outbreak was too serious to come spontaneously from the workmen as a mere protest against the killing of one member of their class at Draveil, and it was alleged that it would not have occurred except for the instigation of the General Confederation of Labor, against which accordingly feeling ran very high, all the bourgeois parties uniting against them. After a revolutionary proclamation by the committee of the Confederation, the government arrested eight of the principal agitators; and the Association of Trade Unions of the Seine was excluded from the Paris Labor Exchange. The Confederation immediately

elected new officers and decreed a strike of twenty-four hours for Aug. 3, but only a few of the trades responded, and the strike was practically a failure. The Socialist deputies tried to secure a petition calling for the assembling of the Chamber, but could get no signatures. M. Jaurès, in his paper, *L'Humanité*, pointed out that the trade unions had by no means reached the point of organization which rendered a general strike possible. The German Socialist paper, *Vorwaerts* remarked that the lesson of the recent affair was that in France, the Socialist party was evidently not regarded by a large part of the workmen as representing in any sense the wishes of the proletariat and that the French laboring class was generally distrustful of Socialism, particularly of the Parliamentary Socialism, as manifested in recent years.

The defiant attitude of the General Confederation of Labor added apparently to its popularity among the working classes. It recruited its number rapidly, and the recruits included even the government workmen from the Custom House, the match works and the arsenals. The Post Office clerks were also inclined towards an affiliation with the General Confederation. The large and important Federation of Miners, which had not affiliated with the Confederation hitherto, was admitted on Aug. 4. A number of agricultural laborers also joined. See TRADE UNIONS.

ATTACKS ON THE LABOR POLICY. The course of the government was sharply criticised by the opposition for weakness and for the disparity between its words and its deeds. Many of the Radicals and most of the Republicans favored the suppression of the Confederation. On the other hand, M. Jaurès declared that the reason for the failure of the strike was that the Confederation was not strong enough. The Republicans argued that the Confederation having constantly violated the law of 1884, which required that trade unions should embrace only similar occupations, and having repeatedly broken the fundamental laws of society, ought to be dissolved. The government was condemned for not enforcing its dissolution, and also for failing to put through the measure that had been brought up in Parliament forbidding the government workmen to join trade unions. Speeches from members of the ministry had expressed the right principles, said the Republicans, but their acts had not conformed to their words. The government was between two fires. On the one side, it was denounced by Socialists and trade unionists as murderous and tyrannical, and on the other was condemned for undue leniency.

On April 6, in the Chamber of Deputies, M. Clémenceau answered the criticism of M. Jaurès as to the general policy of the government, and especially its attitude towards the working classes. He declared that the government's programme looked to the organization of the democracy, and that while he favored the rights of the working classes, he deprecated all resorts to violence, and he retorted with some sharp criticism of the Socialists. The matter came up again in the Chamber on Oct. 23, when M. Deschaud spoke on his interpellation as to revolutionary trade unionism, which he criticised as a means of preventing any real organization of labor, and not as a means of improving the workman's condition. He asked the opinion of the government on this subject. After a brief interpellation by another member, asking what measures the government had taken against the

anarchistic agitation of the General Confederation of Labor, M. Viviani, Minister of Labor, replied, condemning in substance the course taken by the Confederation. He remarked, however, that a small minority were now in control of that organization, and that the reform element in it had already shown signs of activity. He explained the social, political and legal grounds of the government's objection to dissolving the Confederation, and declared that conciliation was preferable to that course. He suggested the establishment of collective contracts and of councils of labor and arbitration; and he appealed to the bourgeois classes to assist in the education of the proletariat. The Chamber approved the government's position by a vote of 324 to 60. On Oct. 31, the members of the General Confederation of Labor who had been arrested after the Draveil affair were set free.

DEBATES ON THE MOROCCAN POLICY. The course of affairs in Morocco was the main subject of interest in the year's record. The details of the French military operations and of the contest between the rival sultans, which resulted in the overthrow of Abd el Aziz by Mulai Hafid, will be found in the article MOROCCO. In the French Parliament the forward policy in Morocco which was begun early in the year aroused the opposition of the Socialists and led to interpellations in the Chamber by the Socialist leader, M. Jaurès, who sharply arraigned the course taken by the government. He condemned the Moroccan enterprise and demanded withdrawal from it. His opinions were familiar to the public and not much importance was attached to them, but they served to call forth an interesting expression of opinion from M. Delcassé in his retirement, who explained the Moroccan policy which he had followed as Minister of Foreign Affairs. France, he said, had done wrong in going to Algceiras under threats from Germany. These threats had no real basis. War would not have followed the refusal of France. Germany's campaign at that time was, he declared, merely one of intimidation. Against M. Delcassé's views on this point it was urged that he had much to say about the friendship and the alliances of other nations with France, but nothing of the readiness of France for war, and he was criticised for having done so little to place her on a satisfactory military and naval basis. Nor could his critics agree that Germany would not have gone to war at that time. By a large majority the Chamber voted (436 to 51) on June 28, their confidence in the government's policy, declaring that French interests in Morocco should be defended without interfering with internal affairs, and that the Act of Algceiras should be applied.

DIFFICULTIES WITH GERMANY. The government encountered more serious difficulties in its relations with Germany, which on several occasions seemed in danger of becoming strained. The press in the two countries abounded in recriminations during the year, but the chief difficulties were caused by, first, Germany's attitude in the question of recognition of Mulai Hafid, and second, her position in the matter of the Casablanca deserters. Both questions were settled amicably, but they left the general impression not only in France but among observers in foreign countries that Germany had no real occasion to raise them at all. After Mulai Hafid was proclaimed Sultan at Tangier (Aug. 23) and declared that

he would observe the terms of the Act of Algeiras and assume his predecessor's public debts, the German government proposed his immediate recognition by the Powers. The French held that the initiative in Moroccan affairs belonged incontestably to France and Spain, as the mandatory powers under the Act of Algeiras. They saw in Germany's sudden demand an intention to cause difficulties and perhaps even an attempt to humiliate France, as in 1905. The French and Spanish governments responded to this demand in a joint note addressed to the Powers, in September, declaring that they were ready to recognize Mulai Hafid under the following conditions: Confirmation of already existing treaties between Morocco and foreign states; acceptance of responsibility for debts of the previous Sultan; recognition of the commission of indemnities for Casablanca, and responsibility for the payment of these indemnities; formal and public disavowal of the Holy War, and the address of a notice to that effect to all the towns and tribes; immediate adoption of all measures necessary to insure the safety of the ports and of the travel routes of the interior. It concluded with the following paragraph: "These guaranties once obtained, Mulai Hafid may be officially recognized. The Powers naturally retain the right to demand directly of the new Sultan the settlement of the questions that concern their separate interests, and particularly as regards France and Spain the reimbursement of the expenses occasioned by the recent expeditions as well as the payment of indemnities for the murder of their citizens. It would finally be desirable that the new Sultan should make honorable provision for Abd-el-Aziz." The German note in reply to the Franco-Spanish communication was issued on Sept. 23. It expressed the agreement of the German government with these conditions, was cordial in tone and offered only a few minor suggestions that made no material alterations.

THE CASABLANCA AFFAIR. German diplomacy took much the same course in the Casablanca incident. This incident, as narrated by the press at the time, was as follows: Five soldiers (according to some accounts, six) of the Foreign Legion, including three Germans, deserted and concealed themselves in Casablanca under the protection of the German Resident. A German steamer having arrived in port, the deserters, escorted by employees of the consulate, went on board. The French gendarmes having attempted to arrest them, a struggle ensued, but finally they were all arrested and imprisoned. The German Consulate thereupon demanded the release of the three Germans, and the French military authorities refused. According to the German official account, the three German deserters, while being escorted to the vessel by the secretary and a soldier of the Consulate, were attacked by French marines. There were further conflicts in detail in the other accounts of the affair, but the main point is that the German contention at first was that Germans serving in the French Foreign Legion retained their national rights and privileges, and that German consuls are warranted in protecting them if they appeal to the Consulate. The French government immediately made it known that it was ready to submit the affair to The Hague Tribunal for arbitration, but Germany demanded that before this was done the

French government should express its regrets for the manner in which the German representative had been treated by French soldiers. To this the French Minister of Foreign Affairs, M. Pichon, replied that it was not to be expected that the French government would condemn itself in advance, and it was made known that France would not make any further concession than a reference of the question to arbitration. Finally, however, the French proposed as the solution of the difficulty that both governments should express their regrets simultaneously and in such a manner as not to prejudice the decision of the arbitrators; and Germany accepted this compromise. The protocol as to the arbitration of the affair was signed in Berlin on Nov. 24, and the excitement over the matter subsided. See GERMANY, paragraphs on *History*; INTERNATIONAL ARBITRATION.

THE ANGLO-FRENCH ENTENTE. The friendly relations between France and Great Britain were marked on many occasions during the year, especially by the visit of M. Clémenceau to London to attend the funeral of Campbell-Bannerman; the visit of M. Cruppi, Minister of Commerce, and M. Ruau, Minister of Agriculture, at the opening of the Franco-British Exposition, and the visit of President Fallières during the exposition. M. Fallières was in London from May 25 to May 29. On these occasions there were many evidences of the popularity of the *entente*, and at the banquet given to M. Fallières at Buckingham Palace on May 26, the King and the President expressed their hopes that the *entente* would be strong and enduring. The question of making it a definite alliance was much discussed in the press, but the general opinion seemed adverse to this as not likely to be of any advantage to either power, and to favor rather the maintenance of the existing relation.

QUESTIONS OF NAVAL ADMINISTRATION. Parliament opened on Oct. 13. The months of October and November were taken up largely with discussions of the successive clauses of the budget, which was finally passed by the Chamber on Nov. 28. During the discussion of the naval budget, M. Delcassé, who had been president of the committee appointed to investigate the causes of the disaster on the *Iéna* in 1907, attributed it to the negligence of the authorities, and demanded a complete reform. M. Thomson, Minister of Marine, replied to the effect that much of the responsibility rested on his predecessors. The Chamber by a large majority passed a resolution deploring the negligence in the naval administration, but later, on the demand of M. Clémenceau for a vote of confidence in the government, withdrew certain words in that resolution which had been construed as implying censure of the ministry as a whole. At the end of the session M. Thomson resigned, and on the following day was succeeded by M. Alfred Picard, former Commissioner General of the exposition of 1900. Other disasters than that of the *Iéna* had also occurred more recently. In 1908 for example, an explosion in the turret of a French cruiser had resulted in the death of several men. (See paragraph *Navy* above.) Early in December the council of ministers decided to relieve Vice-Admiral Germinet, who was reported in the press as saying that a certain article which had declared that the six newest battleships had no

ammunition for many of their guns and would be unable to fire after three hours of action, owing to the deficient reserves in their arsenals, was correct, and that he had written and spoken to the minister about the matter. In certain quarters the government's suspension of the Admiral from the command of the Mediterranean Squadron was criticised on account of his long and distinguished service. Its action was said to be too severe and without precedent. M. Clémenceau's explanation turned on the necessity of maintaining discipline. He pointed out the ways open to the Admiral for redress if his immediate superior did not listen to him; and he condemned the Admiral's recourse to newspaper publicity. The main point of the affair was, he said, the actual condition in the navy. He announced that an investigation would be made by the new minister, M. Picard, who would thoroughly examine the state of the fleet and report on it in January. Meanwhile there were not sufficient data to decide the question, but if Parliament thought it knew enough about it it might divide against the government. In the vote that followed the government was sustained, Dec. 8, by a majority of 335 to 140.

OTHER EVENTS OF THE YEAR. The question of church separation no longer held the prominent place that it occupied in 1907 and preceding years. There were, however, some echoes of the old controversy. Among these was the question of the so-called mutual associations among the clergy. The suggestion had been made, on the side of the Catholic laity, that the large accumulated funds bequeathed for the celebration of masses might be transferred to associations of aged priests if organized in the form of mutual aid societies and under legal sanction. An amendment to that effect was adopted in the Chamber on April 9, by a vote of 345 to 205, the minority comprising the irreconcilable anticlerical element. On May 21, however, the Pope, in a letter to the French cardinals, refused his sanction to the proposed "mutualities," loath though he was to impose new sacrifices upon the harassed French priesthood. He disapproved of the mutual associations because the opportunity for membership would be open to undesirable persons, and no means were provided for expelling delinquent members, or such even as had left the communion of the church. "To sum up, the French pastorate is called upon to organize itself into an independent body and to abandon their character as priests in communion with the Apostolic See." The failure of the mutual associations aroused wide disappointment in Catholic circles. The property that would have gone to them was given to charitable institutions or held subject to the direct heirs of the original legatees. On Jan. 12 the Abbé Loisy was summoned by the Bishop of Langres to answer certain questions in regard to statements that it was alleged would appear in a forthcoming book, but he did not obey the summons, excusing himself on the ground of ill-health. A week later he was required by the Bishop to submit to the Papal decree and the *Pascendi* Encyclical and to promise conformity in his future publications. The Abbé made some objections in his reply. On Mar. 7, after publication of his book, he was excommunicated.

The Feminist Congress was held in Paris early in July. The woman suffrage movement was ac-

tive in France during the year, as in other countries, but is there known under the more general name of Feminism, and aims not only at political, but at social reforms, in such matters as marriage, divorce, the rights of the father over his children, etc. There were signs of a growing demand in certain quarters for the introduction of proportional representation, the *scrutin de liste*, the redistribution of seats, and the reduction in the number of members of Parliament. Among the leaders of this movement were Delcassé, Deschanel, Ribot, Brisson and other prominent public men. Active measures had been taken toward the close of 1907 to secure these reforms, and an important parliamentary group continued in 1908 to carry on its propaganda.

In the municipal elections of May the Socialists underwent a serious defeat. (See **SOCIALISM.**) In February a group of Parisian Protestants petitioned the Senate against infringement of the worship and of the private property of any religion. In July the Paris Commune asked the government for the "transfer to the city of the fortifications of Paris, with a view to the construction of an outer circular boulevard and several public parks." Important questions arose during the year in connection with the administration of Algeria, the French Congo and Indo-China. In the last-named dependency the granting of a native consultative chamber had marked a policy of concession to the growing demands of self-government; but it was soon feared that the administration had gone too far in that direction. The new Governor-General, appointed in 1908, adopted a more stringent policy toward native aspirations. For a discussion of this and other matters affecting these colonies, see the several articles.

The question of capital punishment was discussed in the press and Parliament throughout the year. The death penalty had been virtually suspended for some eight years through the exercise of presidential clemency. M. Fallières was personally opposed to capital punishment, and M. Clémenceau's Socialist-Radical party was pledged to bring about its abolition. Public sentiment, however, was stirred up during the last two years by a series of peculiarly revolting murders and a general increase of crime. On Dec. 8, the Chamber (330 votes to 201) declared for the reestablishment of the death penalty. Measures for combating the increasing alcoholism among the poorer classes received much attention. The consumption of distilled liquors has increased 400 per cent. in 70 years and France has the unenviable distinction of ranking with Austria-Hungary and Belgium as nations of increasing inebriety. During the last week of December there were serious riots among the Parisian medical students owing to a change in the scheme of examination at the Sorbonne. The appointment of M. Thalamas, the author of a somewhat hostile *Life of Joan of Arc*, to a professorship at Sorbonne, gave rise to considerable disorder. On Christmas day, President Fallières was attacked by a half-witted person who announced that he was a Royalist partisan and took this means of protesting against the government. The assailant was unarmed and M. Fallières received no injury, but intense indignation was aroused by the attack, which even the Royalist papers characterized as the act of an imbecile.

FRANCIS JOSEPH I. EMPEROR OF AUSTRIA. See AUSTRIA-HUNGARY.

FRANCO, João. A Portuguese statesman, became practical dictator after the dissolution of the Cortez on May 11, 1907, and maintained his position until the assassination of King Carlos on Feb. 1, 1908. He was born in the province of Beira, received a good education, and entered Parliament. He founded the party of Liberal-Regeneradores in 1901 with a platform of social and economic reform, and in 1906 was asked by the King to form a ministry. For many years Portugal had been in the grasp of two parties, professing respectively Liberal and Conservative principles, and nominally antagonistic, but in reality united in the pursuit of office and the fostering of corruption. On taking office, Franco entered upon a policy of stringent reform, but he was defeated in the elections of 1906, and the opposition of the politicians caused him to dissolve the Chambers. From that time he ruled as a dictator, supported by the King. The press was placed under strict censorship, and it was his idea to return to representative government only after the success of his reforms had demonstrated their utility. The dissatisfaction with his rule culminated, however, in the assassination of King Carlos, and Franco was obliged to leave the country. See PORTUGAL.

FRANCO-BRITISH EXHIBITION. See EXPOSITIONS; ARCHITECTURE.

FRANZ FERDINAND, Archduke of Austria and heir-apparent to the throne of Austria and Hungary, took a prominent part in directing Austrian foreign policy during the year 1908, and to his influence is supposed to be due the annexation of Bosnia and Herzegovina, contrary to the advice of the Emperor. He was born at Gratz in 1863, the son of Karl Ludwig, eldest brother of Franz Josef, the present Emperor. His father became heir presumptive in 1889 on the death of the Emperor's son, Rudolph, but renounced his rights in favor of his son, and died in 1896. Franz Ferdinand marriedmorganatically in 1900 the Countess Sophie Chotek. The issue of the marriage are incapable of inheriting the Austrian throne, but it is contended that the Hungarian laws are different, and some difficulty is expected from the efforts he is likely to make to compel the recognition of his wife as Empress on his accession and to secure the succession in both realms to his eldest son.

FRATERNAL ORGANIZATIONS. A title applied to those secret societies which maintain a death, sickness, or accident fund for their members. Many of these societies are under the surveillance of the State insurance departments, which exact from the governing bodies such statistical information as tends to check betrayal of trust. The following are the principal organizations of the kind in the United States:

	Date of foundation	Membership.	Benefits dis- bursed since organization.
American Benefit Society	1893	6,000	460,000
American Guild	1890	25,000	1,726,179
Ben Hur, Tribe of	1894	100,315	5,948,702
B'nai B'rith, Independent Order of	1843	30,283	
B'rith Abraham Order	1859	61,389	2,673,359
Brotherhood of American Yeomen	1897	61,671	2,131,626
Catholic Benevolent Legion	1881	18,644	19,860,715
Catholic Knights of America	1877	20,000	16,000,000
Catholic Mutual Benefit Association	1876	59,442	19,164,829
Court of Honor	1895	65,000	5,588,303
Druids, United Ancient Order of	1781	30,042	6,267,371
Eagles, Order of	1889	311,159	3,920,532
Elks, Benevolent and Protective Order of	1868	284,321	
Foresters, Ancient Order of	1836	40,992	135,950,000
Foresters of America	1864	260,000	26,000,000
Foresters, Independent Order of	1874	235,441	821,912
Fraternal Brotherhood	1896	38,341	1,278,850
Fraternal Union of America	1896	28,627	940,474
Golden Cross, United Order of	1876	77,389	9,630,604
Heptasophs, Improved Order of	1878	19,656	14,108,663
Hibernians of America, Ancient Order of	1836	217,000	27,892,750
Irish Catholic Benevolent Union	1869	15,000	491,413
Knights and Ladies of Honor	1877	96,000	27,000,000
Knights of Columbus	1882	210,078	3,669,597
Knights of Honor	1873	40,126	86,692,268
Knights of Malta, Ancient and Illustrious Order	1048	30,000	
Knights of the Golden Eagle	1873	71,960	
Knights of the Maccabees of the World	1883	285,341	34,212,159
Knights of the Modern Maccabees	1881	112,846	1,227,904
Ladies' Catholic Benevolent Association	1890	102,129	6,169,076
Ladies of the Maccabees of the World	1892	156,609	6,444,410
National Union	1881	62,000	27,000,000
New England Order of Protection	1887	54,119	6,950,000
Order of Gleaners	1894	56,000	744,521
Pilgrim Fathers, United Order of	1879	19,634	6,862,880
Protected Home Circle	1886	65,273	4,349,674
Rechabites, Independent Order of	1842	441,000	10,000,000
Red Men, Improved Order of	1763	471,661	23,918,007
Royal League	1883	29,141	5,337,044
United American Mechanics, Order of	1845	36,554	
United American Mechanics, Junior Order of	1853	194,741	7,172,891
United Workmen, Ancient Order of	1868	219,729	163,445,905
Woodmen of America, Fraternity of Modern	1883	920,079	64,561,733
Woodmen of the World	1890	505,398	4,652,941

FRÉCHETTE, LOUIS HONORÉ. A French-Canadian poet, died on June 1, 1908. He was born in Lévis, P. Q., on Nov. 16, 1839, was educated at the Quebec Seminary and at Laval University, and was called to the bar in 1864, but in 1865 went to Chicago, where he remained until 1871. Here he was employed first as a journalist, and then as corresponding secretary of the Illinois Central Railway Land Department. He returned to Canada in 1871, and practised law in Quebec until 1874, when he was returned to the House of Commons for Lévis. After 1882 he devoted himself chiefly to literature, though in 1889 he was appointed clerk of the Legislative Council of the Province of Quebec. He edited *Le Journal de Québec* in 1861-62, *Le Journal de Lévis* in 1864-65, *L'Amerique* (at Chicago) in 1868-70, and *La Patrie* (Montreal) in 1884-85. Fréchette was the most distinguished of contemporary French-Canadian writers; two of his volumes of poems, *Les fleurs boreales* (1880), and *Les oiseaux de neige* (1880), were crowned by the French Academy in 1880, and he was awarded the first Montyon prize. He was made an LL.D. by both McGill and Queen's universities in 1881, was appointed a fellow of the Royal Society of Canada in 1882, and was created a C. M. G. by Queen Victoria in 1897. He was a founder and the first president of the Canadian Society of Arts in 1893, was created a Knight of the Legion of Honor in 1897, and was an officer of the French Academy. Dr. Fréchette had been called the "Lamartine of Canada," and it was said of him that he had "made the history of France beyond the seas live again in poetry."

FREEER, FREDERICK WARREN. An American painter, died on Mar. 7, 1908. He was born in Chicago, on June 16, 1849, studied in the Royal Academy in Munich, and also in Paris, and from 1880 to 1890 lived and worked in New York City. He was awarded medals at the World's Fair in 1893, at the Pan-American Exposition in 1901, and at the Charleston Exposition in 1902; the Cohn prize at the Art Institute in Chicago, in 1903; the Artist's prize and medal at Chicago in 1903, and a bronze medal at St. Louis in 1904. For several years he had been an instructor in the Art Institute, in Chicago. His principal pictures include "A Lady in Black," "Consolation," "The Old Letter," "Sympathy," and "In Ambush."

FREE-TRADE CONGRESS. See **TARIFF.**

FRENCH ACADEMY. See **ACADÉMIE FRANÇAISE.**

FRENCH CONGO. A French possessor in equatorial West Africa. Its area is estimated at 680,000 square miles, and its population at 8,000,000, that of the territory directly administered being estimated at 3,652,000 in 1907. The products include manioc, coffee, vanilla, cacao, kola nuts, pissava, palm-kernels, palm-oil, valuable woods, rubber, etc. Libreville, in the north, and Loango, in the south, are the principal ports. The imports and exports in 1907 were valued at 15,652,482 and 20,298,039 francs respectively, the trade with France amounting to 6,565,000 of imports and 9,134,000 of exports. There are about 870 miles of telegraph line. The country as a whole is under a Governor-General—in 1908, M. Merlin—assisted by a Secretary-General and an administrative council. Since Feb., 1906, the country has been divided into three colonies—the Gabun

colony, to the south of Kamerun, with Libreville as the capital; the Middle Congo colony, to the north and east of the former, with Brazzaville, on the Congo, as the capital; and the Ubangi-Shari-Chad colony, farther north, with Fort-de-Possel as capital. The first and last named are under Lieutenant-Governors, while the Middle Congo colony is under a Chief Administrator. The Chad region of the Ubangi-Shari-Chad colony is for some purposes administered as a territory. Each of the three colonies has an administrative council and a distinct budget, while the Commissioner-Generalship has a general budget of its own. For 1907 the general budget balanced at 5,019,000 francs, and those of the separate colonies balanced as follows: Gabun, 383,000; Middle Congo, 508,100; Ubangi-Shari, 423,000; Chad, 302,000. The expenditure of France on the French Congo for 1908 was estimated at 3,780,329 francs. The debt of the French Congo in 1907 was 1,706,000 francs. The military force consists of over 3000 men, nearly all natives. Included in the French Congo are the native states of Bagirmi and Wadal. The latter has proved troublesome to the French, and will yet have to be conquered.

HISTORY. In 1908 there were signs of awakened interest on the part of the home government in the development of French Congo. Hitherto, little had been done for the improvement of the country and the let-alone policy was the rule. But with the recent nomination of M. Merlin as Governor-General, more public interest in the colony was shown. Down to 1907 there were only 1600 effective troops. In that year the number was increased to 2250, and in 1908 to 3000. In the latter year the new Minister of the Colonies, M. Milliès-Lacroix, said he would ask for funds sufficient to support 4000 native sharpshooters in 1909. Plans were also formed for uniting the various posts by telegraph, including a line from Loango to Libreville, and two other lines centring at Brazzaville. As to railway projects, for some time two routes have been under consideration for a new line of railway. One of these runs from Loango along the Niari-Quilliu Valley and the other from Libreville through a fertile country to an affluent of the Congo at the point where it becomes navigable. Objection to the former has been made on the ground that it is too near the Belgian Railway. The railway of Belgian Congo is open to the traffic of the neighboring states, but it drains only the country along the banks of the River Congo. Hence this new line in French territory has been proposed. By the decree of June 26, 1908, the title of Commissary-General, hitherto borne by the head of the French Congo administration, was changed to that of Governor-General, and an increase of salary was declared. This marks the raising of the status of French Congo to the rank of the more important French colonies and indicates the growing interest of the home government. A short time before the publication of that decree, a treaty dated June 9, 1908, fixed the frontier between the French Congo and the adjoining German colony of Kamerun. A provisional boundary line had been determined between French Congo and the Kamerun in 1894, but at that time the country was imperfectly known. The new boundary treaty substitutes for the limits of 1894 a more

exact frontier, and corrects a number of errors in the former arrangement.

FRENCH GUIANA, OR CAYENNE. A French colony and penal settlement on the northeast coast of South America. Area, about 30,463 square miles; population (1901), 32,908, including 4097 convicts and 1885 Indians. In 1908 there were 6290 convicts. Cayenne, the capital and only seaport, had 12,612 inhabitants in 1901. Only about 9000 acres are in cultivation. Gold mining is the principal industry. Silver, iron and phosphates are also mined. The principal exports are gold, phosphates, cacao, woods, rosewood oil, hides, and balata. In 1907 the imports and exports amounted to 14,013,078 and 12,302,369 francs respectively, the trade with France being represented by 10,045,000 francs of imports and 9,666,000 francs of exports. The colony is administered by a Governor, assisted by an Executive Council and an elective General Council. It is represented by one deputy in the French Chamber. The local budget for 1907 balanced at 3,497,000 francs. The debt in 1907 stood at 76,000 francs. The expenditure of France for 1908 was fixed at 6,262,978 francs, nearly all for the penal settlement. The Governor in 1908 was M. Rodier.

FRENCH GUINEA. A French colony in West Africa. Its area is estimated at 106,200 square miles; its population at 1,470,000. The capital is Konakry, on Tombo Island. The products are palm-nuts, palm-oil, earth-nuts, gum, rubber (1500 tons exported in 1905-6), rice, millet, coffee, cacao, bananas, pineapples, etc. In 1905 there were grown 2315 pounds of cotton. There are extensive forests, the mango and kola trees being the most important commercially. Some iron and gold deposits are worked by the natives. In 1907 the imports and exports amounted to 16,344,215 and 15,989,746 francs respectively. The foreign trade is mostly with France, Great Britain, Germany and Liberia, the three first-named countries maintaining regular steamship lines to Konakry. The imports from France in 1907 amounted to 6,095,000 francs, and the exports to France, 5,496,000. The railway from Konakry, which is to run to Kouroussa, on the Niger, was 137 miles long in 1908. A highway, completed from Konakry to the Niger, is to be connected with the railway stations by branch roads. The telegraph lines had a length of 1513 miles in 1905. The colony is administered by a Lieutenant-Governor, who is under the Governor-General of French West Africa (q. v.), and is assisted by a council of six members, three official and three unofficial.

FRENCH INDIA. French possessions consisting of five dependencies in India, namely Chandernagar, in Bengal, 3.6 square miles; Yanaon, 9 square miles; Pondicherry, 111 square miles, and Karikal, 51 square miles, on the east coast of Madras; and Mahé, 22.5 square miles, on the west coast. In 1906 the total population was estimated at 272,113. The population of the principal towns was in 1906 as follows: Pondicherry, the capital, 46,887; Karikal, 17,511; Chandernagar, 24,323; Mahé, 9912; Yanaon, 4645. At Pondicherry the deaths greatly exceed the births. In 1906 there were 229 schools with 17,626 pupils. The imports and exports at the ports of Pondicherry, Karikal, and Mahé in 1907 were valued at 6,885,271 and 26,268,145 francs respectively, the trade with France being represented by 1,376,000 francs of imports and 14,064,-

000 francs of exports. The colony is administered by a Governor, assisted by an elective General Council. In the French Parliament it is represented by a senator and a deputy. The local budget for 1907 balanced at 2,397,000 francs. The debt in the same year stood at 796,000 francs. The French subvention in 1908 was 250,000 francs. The Governor in 1908 was A. Bonhoure.

FRENCH INDO-CHINA. A Governor-Generalship, including the colony of Cochin-China, the protectorates of Tongking, Laos, Annam, and Cambodia, and the lease of Kwang-Chow-Wan, on the south coast of China. For the area, population, products, and local budgets of the various sub-divisions, see under the respective titles. The total area is estimated at 256,000 square miles, and the total population (1906) at 15,858,514. In 1907 the total cotton production amounted to 5,635,840 pounds of ginned cotton and 5,859,840 pounds of seed cotton. The rubber plantations in 1908 were not yet in bearing. The whole country, exclusive of the Chinese lease, forms a customs union. The total imports in 1907 amounted to 294,977,168 francs, and the total exports, 253,357,657, the trade with France being represented by 101,642,000 francs of imports and 39,716,000 francs of exports. Other countries participating largely in the foreign trade are China, Japan, and Hongkong. The principal imports are cotton yarn, cotton piece goods, petroleum, paper goods, tobacco, tea, metal goods, and beverages. The principal exports are rice (1,413,540 tons in 1907, against 728,736 tons in 1906), fish products, pepper, coal, hides and skins, cotton, rubber, silk, and gum-lac. Of the 1,505,015 tons entered in 1906, 691,067 was French, 333,046 British, and 226,279 German; of the 1,523,083 tons cleared, 713,861 was French, 321,950 British, and 236,310 German. In 1908 the railways had a length of 711 miles, exclusive of those in construction; telegraphs, in 1906, 8461 miles. The general administration is in the hands of a Governor-General at Hanoi, Tongking, assisted by a Secretary-General. The protectorates are under the supervision of Superior Residents, while Cochin-China is under a Lieutenant-Governor. The military force in 1908 consisted of 14,309 Europeans and 18,427 natives. The naval force consists of a battleship, 3 armored cruisers, 3 protected cruisers, 4 destroyers, 2 gunboats, 12 torpedo boats, 4 submarines, and smaller craft, with 4500 men. The general budget for 1908 balanced at 32,805,000 francs, the revenues being derived mainly from customs, monopolies, posts, telegraphs, and railways. The debt in 1907 amounted to 392,557,000 francs. The expenditures of France for 1908 were fixed at 14,448,519 francs for Cochin-China and 29,407,359 francs for Annam and Tongking, nearly all for military purposes. In 1907 Siam surrendered to France about 7800 square miles of territory adjacent to Cambodia, while France restored to Siam certain territories in the Laos region and also granted it a perpetual lease of four ports on the Mekong. The Governor-General in 1908 was A. Klobukowski.

THE NEW GOVERNOR-GENERAL. M. Klobukowski was appointed to succeed M. Beau as Governor-General, and started for Indo-China on Aug. 30 to assume his duties. He was formerly minister to Cairo and had had a long and distinguished career, in the course of which he had served in Indo-China and gained a thorough knowledge of the Far East.

ECONOMIC AND FINANCIAL CONDITIONS. The colonies appeared to be on a sound economic and financial basis in 1908, having completely recovered from the crisis of 1905-6. Commerce had recently increased and the budgets were beginning to show a surplus. Periods of scarcity had recurred with great regularity and the government's surplus in good years was likely to be required to meet the demands of hard times. The retiring Governor-General declared that within two years and without increased taxation means would suffice for the carrying out of plans for economic improvement, including the loan for the construction of the Yunnan railway. There was, however, popular discontent with the methods of collecting the taxes. Abuses in the collection of indirect taxes caused disaffection among the natives in certain localities.

DISTURBED POLITICAL CONDITIONS. For an account of the difficulty with the Chinese on the Tongking frontier, owing to their raids across the border and the killing of French troops, see CHINA, paragraphs on *History*. This occasioned some criticism of the French government for having in the previous year reduced the number of effective troops in Indo-China and diminished the number of fortified places on the frontier. The situation among the natives was more alarming, especially in Central Annam, where in April and the early part of May there were signs of serious disaffection. Thousands traversed the country in bands, compelling passers-by to join them, and urged the people to join in a strike against the payment of taxes. They went before the resident chiefs and protested against the exactions of the mandarins. They were unarmed and did little damage. The Europeans were unmolested. The real nature of the movement was not understood. Some explained it as a popular impulse toward progress along the lines that Japan had followed. Others saw in it a conservative reaction in favor of the old régime. Its immediate cause, however, was the discontent with the tax system as administered by the mandarins. Critics of the government argued that too many concessions had been made to the vague political aspirations of the people, creating an impression that the government would relax its hold. It was ill-advised, they said, to encourage the natives with hopes of liberty in the European sense and of institutions unsuited to their stage of development. It was also said that the rule was divided between too many conflicting and overlapping jurisdictions to the confusion of the Annamese. On June 27 an attempt at poisoning nearly cost the lives of 250 French soldiers. This greatly alarmed the colonists, a body of whom went to the Governor-General's palace, forced the doors and demanded the heads of the guilty. The Governor-General restored order with some difficulty. Much concern over the matter was expressed in the French press. The criminals were punished with great severity. Some native soldiers attempted a mutiny and there were further aggressions from bandits, who had for a long time past committed outrages at intervals. These things were cited as proof of greatly disturbed conditions, but on the other hand it was said that the situation was not as serious as had been represented and it was thought that the new administration would deal with it effectively. Vigorous measures had already been taken against the bandits

and the government had increased the corps of occupation. Some critics of the administration advocated an extreme measure of decentralization that would leave the Governor-General little authority. Others held that the difficulties would be removed by more prudent and skilful administration, declaring that the agents of the government were often imprudent and careless of political consequences, especially in the matter of collecting taxes. They advocated the admission of the resident chiefs to a share in the financial administration. They said that the trouble was due in no small part to the dispersion and crumbling of power, to the tendency to get out of relation with the mandarins, to the introduction of an education that did not sufficiently regard tradition and was ill-suited to the needs of the people and to the importation of electoral devices out of keeping with their character.

FRENCH LITERATURE. The year 1908, like 1907, was notable for a rather marked tendency to react against radical theories, a tendency which manifested itself in two ways: with some in giving up altogether the fighting for ideas and for a while cultivating art for the sake of art; with others, in opposing conservative theories to revolutionary views. Possibly in 1908 there was a little more fighting spirit on the progressive side.

THEATRE. As the *YEAR BOOK* gives elsewhere a special account of the events in the dramatic world, we need only indicate here a few facts that will not be reviewed there.

Several authors adopted the form of the drama in verse to express their ideas, without expecting to get their works put on the stage, so Blémond, *Théâtre légendaire*, with such plays as *Le jugement de Salomon*, *Reyne de Naples*, *Libres cœurs*; and Raoul de Lafayette, who has a great five act drama, *La grande Lorraine* (Lafayette belongs to the first generation of the Parnassian poets).

Several classical novels were put on the stage: Balzac's *L'auberge rouge*, Bourget's *L'émigré* and *Le divorce*, Loti's *Ramuntcho*. Among the interesting "reprises" was Molière's *Misanthrope*, with Mlle. Cerny, and Leitner.

The 50th anniversary of Rachel's death was commemorated. The creation of a *Théâtre indépendant* which produces plays of young authors, nine a year, should be mentioned. After the "première," 15 representations will be given in different quarters of Paris and of the provinces.

NOVELS. Some maintain that the novel is losing ground in literature (See *La Revue*, Oct. 1, 1908, *Le Krach du Roman*). Certainly the reviewer feels quite differently, seeing not only the great number of them that came out in France in 1908, but the great number of good ones. First there are a good many that cannot be considered as exactly introducing a new note in literature, but must be mentioned as standing above the average production: Marcel Prevost's *Lettres à Françoise Mariée* are still interesting, though not up to the *Lettres à Françoise* (1907). The clever, poetical, piquant girl fascinated us; the poetry of married life is not so well grasped by the author, and then a man giving advice to a married woman—it is just a trifle ridiculous; but Marcel Prevost turns to be more and more a writer of the moralizing type. Bourget's *Détours du cœur* are such stories as have come from the pen of this author for many

years and which will please the admirers of the subtle psychologist. *Aloyse Valérien* is one of the strongest books yet written by Rod, showing very forcibly the discrepancy between our social theories, indispensable to assure order, and our individualistic aspirations which refuse to submit to the requirements of social conventionalities. L. Frapié's *Les figurantes* treats in his usual gloomy tone the modern problem of the relations between masters and servants, the latter being the *figurantes*. G. Rouvier's *Toits rouges* studies the same problem as Bourget's "L'épave," i. e. the man who tries to rise above his class and suffers wreck; and Halévy's *Un épisode* shows—again in the reactionary spirit of a Bourget—how a man, only moderately gifted and who is misled by the teaching of the "université populaire," ends by killing himself because he does not feel that he can ever become "esthetic" enough. Perhaps the most powerful novel of the year in France is *La vie secrète* by Estaunié (the author of *L'empreinte*). Every one has within himself possibilities to achieve something in life; he may lead apparently the dullest life, the most insignificant one in the eyes of his fellow men, while, unknown to the others, even of his friends, he is burning with an interior fire for some generous, disinterested purpose in life. Many neglect their chances, others get at their "secret life" only through terrible storms, but the one who does not answer when God passes and calls them remains of course sterile.

The humorously pathetic novel is cultivated more and more in France, and by masters too. Jules Renard, of the "Académie Goncourt," has given brothers and sisters to the inimitable "Poil de Carotte," in *Ragotte*, and in *Les frères farouches*. A. Lichtenberger has scored another success with *La folle aventure*. Tristan Bernard is extremely human in *Deux amateurs de femmes* (not a book for girls), and Jean Aicard has given us a work that will not be forgotten again, his most picturesque and amusing *Maurin des Maures*, a sort of Don Quixote from Provence, another Tartarin.

Daniel Lesueur's *Nietzscheenne* has been much talked of, on account of the reputation of the author, but it is clear that she has not read one line of Nietzsche; for what she calls a Nietzscheenne is nothing but a good, courageous woman. A truly Nietzschean novel, on the other hand, is Abel Hermant's *La discorde*, where a weakling is first tortured morally by a wife who has taken to the morality of the right of the strong, and finally killed by his brother-in-law who commits his crime to obey his principle of "transcendental immoralism." Hermant publishes also *Train de luze*, with a series of pictures of famous personalities from all over the planet who come to Paris in order to forget their troubles and their failures in life. Jules Bois's *Vaisseau des carresses* is the story of a young girl globe-trotter, "Glatic, l'alouette de Java" whose desultory frivolous, tragic love adventures aboard a great steamer causes sufferings for herself as well as for others.

The historical novel seems to regain special favor. Several are inspired by the Franco-Prussian War: *Les étapes douloureuses* by Baron d'Verly (étapes from Metz to Sedan); *Les cahiers rouges* by M. Vuillaume (relates to the horrors of the Commune); *L'Espoir* by G. Lecomte (describes the days after the war); novels of the times of the French Revolution;

Marcel Bastilliat's *La Vendée aux genets* is a novel of the kind of Balzac's *Chouans*, and G. d'Esparbé's *Le briseur de fers* is an inspiring account of the exploits of a genial sea captain, Hubert, against the English.

Two novels deserve special mention. Romain Rolland's *Jean Christophe à Paris*, the fifth volume of a story whose four preceding ones described the disillusion of the hero, a musician, in modern Germany where industrialism and militarism crush higher aspirations. The author is by no means more indulgent to Paris than he was to Germany in his criticism: art, literature, philosophy are just for show; the hope and strength of France is not in this civilization of "rastaquouères" which people usually admire, but in the lower strata of population and amongst those simple hearted people who are the brothers and sisters of Joan of Arc.

The other important novel is France's *L'île des Pingouins*. This is an allegorical history of France.

The Prix Goncourt was given to Francis de Miomandre, for a witty satire of Symbolism: *Écrit sur l'eau*. The "Vie Heureuse" awarded Estaunié's *La vie secrète*, its 5000 francs prize.

POETRY. No striking work here. Ernest Dupuy, the well known biographer of V. Hugo, publishes at last his *Poèmes*, which remind one of the romanticism of Vigny's "Destinées." Jean Ott's *L'effort des races* is a sort of "Légende des siècles" from an ethnological standpoint; the poet sings the deeds of the Huns, Gaels, Normans, etc. Paris inspires Méral's *Poèmes de Paris*, and Phil. Dufour's *Paris pittoresque*. The French Academy has crowned Amiel's *Sonnets* describing the statues and pictures of the Panthéon, the Louvre and the Luxembourg; E. Beauplis's *Italiam. . . . Italiam!* celebrating once more Italy as the mother country of art; and Sylvain Déglantine's *La lyre Malgache*, descriptions, legends, picturesque customs of Madagascar. Other interesting volumes are Anne Osmont's *Nocturnes* (crowned by La Vie Heureuse) and Mad. Cecile Perin's *Les Pas légers*, the light steps of children.

The return to the classical prosody is noticeable. Still the advocates of freedom or the Décadents are by no means reduced to silence. Paul Fort offers another volume, *Ile de France*, of his quaint ballads, quaint both in form and in content, while Paul Drouot, in *La grappe de raisin*, and Micheletis in *Espoir merveilleux* are evidently trying to undo their patron saint Mallarmé.

Two great poets remain to be mentioned: Verhaeren, whose *Mirages de la vie* have created much enthusiasm among his admirers; a great celebration was made in Brussels in his honor, and his friends have tried to secure for him the Nobel prize in poetry; then a posthumous book by Sully-Prudhomme: *Epaves*.

MEMOIRS are still in fashion. The most successful this year have been the *Mémoires de Madame de la Suze*, for the 17th century. For the first half of the 19th, besides the last volume of Mme. de Boigne's *Mémoires* those of the Duchesse de Dino were widely read. In those of Mlle. George, we find a remarkably poetical and tender Napoleon; this seemed somewhat suspicious and it was found out that the *Mémoires* had been altered; they were to be published during the 2d Empire, and Mlle. George thought that she might lose her pension from the government if she did not arrange

things somewhat. For the time of the 3d Republic we have Déroulède's *Nouvelles feuilles de route* (souvenirs of the war of 1870-71); Ed. Birès's *Souvenirs*: Paul Margueritte's *Les jours s'allongent* and Maurice Barrès's *Vingt cinq années de vie littéraire*. Not without interest are the *Mémoires* of Loie Fuller (the inventor of the serpentine dance) with a preface by Anatole France.

Several works in history ought to be mentioned here: A. France's *Jeanne d'Arc*, two fat volumes, full of erudition, but the author's attitude satisfied neither the orthodox, nor the scientific minds; Michelet's pages on Jeanne d'Arc remain the great literary monument of the pucelle d'Orléans. The Comte d'Haussonville gave his last volume of *La duchesse de Burgoyne*, thus completing perhaps the most perfect picture of the society of France in the 17th century. Concerning the Napoleonic era: F. Masson, *Autour de Ste Hélène*, P. Frémeaux, *Les derniers jours de l'empereur*. Then E. Ollivier continues his *Empire libéral*, discussing the always burning question of the cause of the Franco-Prussian War; while F. Loliée publishes his 3d volume of the *Femmes des second empire*: *Eugénie de Montijo*. Why not add Dr. Funk Brentano's, highly entertaining biography of the famous bandit *Mandrin*?

HISTORY OF LITERATURE. Joseph Bédier publishes the first volume of his revolutionary studies on French epics. Langlois writes on *La vie en France au moyen âge*. Saineau enters a new field with his *Argot ancien* (1455-1850); Stronsky, in his great work on Pascal, gives the volume on *Les Provinciales*. Rigal has a well received *Molière*, and Lemaitre an inspiring *Racine*.

Among the 18th century studies we may mention D. Mornet: *Le sentiment de la nature de J. J. Rousseau à B. de Saint Pierre*, Keim's *Helvétius*, and Lachèvre's very interesting publication of documents on *Voltaire mourant*. Mad. Th. E. Ollivier publishes a book on *Valentine de Lamartine*, the sister of the poet. The *correspondence of Beyle* (Stendhal) is also an important book. M. Salomon has an interesting volume on *Nodier*, and the cenacle, while L. Séché's *Hortense Allart de Mértens* contains besides amusing gossip, valuable information about Chateaubriand, Béranger, Sainte-Beuve, G. Sand, and others. The famous *Thérèse Daquin*, the "inconnue" of Mérimée, is the subject of books by Lefèvre and by Lucien Pinvert. Finally regarding this whole period, there is a book called *Le mal romantique* by E. Seillière. Séché and Bertrand have an *Evolution du théâtre contemporain*, with preface by Faguet. Bourget offers a series of literary portraits, Bonald, Taine, Loti, etc., under the title *Sociologues et littérateurs*, and *The Figaro* published in October interesting letters from the mother of Maupassant to Flaubert. Aulard's attack on Taine as a historian has been most discussed.

The death of Arvède Barine (Mad. Ch. Vincens) was a great loss to French letters. Several commemorations took place: The 300th anniversary of the birth of Massillon, the hundredth of Barbey d'Aurevilly, and of Gustave Planche, and the fiftieth anniversary of Brizeux's death. A statue was erected to Rousseau in Ermenonville, and unveiled in October.

The FRENCH ACADEMY has come before the eyes of the public more than usual. Its con-

servative attitude in the events of recent years has called forth many protests, and even proposals to do away with the institution as antagonizing constantly the government that supported her. Faguet recently proposed that the Academicians of the five "Académies" (about 150 men in all) give up their salaries and thus acquire the right of independent thinking. See ACADEMIE FRANÇAISE.

FRENCH OCEANIA (ESTABLISHMENTS IN).

A French colony in the Eastern Pacific comprising a number of islands and groups of islands scattered over a wide area. It includes the Society and Leeward Islands, 637 square miles and 17,361 inhabitants (1902); Marquesas Islands, 492 square miles and 3563 inhabitants; Tuamotu Islands, 270 square miles and 4294 inhabitants; Gambier Islands, 89 square miles and 1381 inhabitants; Tubuai Islands, 110 square miles and 2111 inhabitants; besides smaller islands. Total area, 1618 square miles; total population (1902), 28,710. The principal island in the Society group is Tahiti, 600 square miles and about 10,750 inhabitants. Its chief town is Papeete, 4282 inhabitants in 1900, three-fourths French. Vegetables, coconuts, bananas, oranges, sugar-cane, vanilla, coffee, and tobacco are cultivated. Sugar and rum are produced. In 1906 there were grown on Tahiti 52,703 pounds of cotton. The government encourages the cultivation of Sea Island cotton, to which the Society Islands are remarkably well adapted, but without marked success. The natives prefer the Egyptian variety, which entails far less labor and is just as remunerative. Deposits of phosphates, estimated at 30,000,000 tons and containing from 65 to 90 per cent. pure phosphate, have been found on the island of Makatea, of the Tuamotu group, about 120 miles northwest of Tahiti. Smaller deposits have been found on other islands. A company has been formed in Paris for their exploitation. In 1907 the imports and exports amounted to 3,331,810 and 3,639,954 francs respectively, the trade with France being represented by 404,000 and 449,009 francs respectively. A large portion of the trade is with the United States, New Zealand, and Great Britain. The chief imports are wheat-flour, cotton goods, and metal goods; the chief exports, copra, vanilla, and mother-of-pearl. The colony is under a Governor, assisted by a privy council and an administrative council. The budget in 1907 balanced at 1,522,000 francs. The debt in 1907 was 249,000 francs. The French subvention was fixed for 1908 at 195,400 francs. The Governor in 1908 was J. P. François.

FRENCH SAHARA. The French sphere of influence in the Sahara extends over nearly the whole of the desert, with the exception of the Libyan Desert. The area is roughly estimated at 1,900,000 square miles, and the population at 800,000. A line of posts to guard the caravan routes has been established, extending east and west 2000 miles, from Cape Blanco, on the Atlantic, to the oasis of Bilma, north of Lake Chad. At Cape Blanco there will be a port of call for French steamers. The neighboring waters are rich in fish. The oasis of Bilma, at the other end of the line, has an area of about 175 square miles, produces dates, wheat, fruit, and vegetables, and is inhabited by 2500 people. It is one of the great sources of salt in the Sahara and sends most of the output to the Sudan. The post at Bilma was established in 1908.

FRENCH SOMALILAND. A protectorate, lying on the Gulf of Aden, between Eritrea and British Somaliland, and extending inland 55.9 miles. Area, about 1,800 square miles; population, 50,000. The principal towns are Jibuti, the capital, 11,000 inhabitants (500 Europeans); the port of Obak, 15,000 (2,500 Europeans); and Tajurah, 2000. The coast fisheries are important. The imports are mainly textiles, foodstuffs, and tobacco; the exports, coffee, ivory, gold, and sheepskins. In 1906 4,321 pounds of cotton were produced. In 1907 the imports and exports amounted to 15,855,647 and 23,091,018 francs respectively, the trade with France being represented by 3,950,000 francs of imports and 2,042,000 francs of exports. A large part of this trade is transit, and includes the bulk of the foreign trade of Abyssinia (q. v.), which passes over the railway, 193 miles long, from Diré Dawa, in Abyssinia, to Jibuti. A telegraph line connects Jibuti and Obok with Harrar and Addis Abeba, in Abyssinia, and with Massowah, in Eritrea. The administration is in the hands of a Governor, assisted by a privy council. The local budget for 1907 balanced at 1,158,000 francs. The expenditure of France in 1908 was fixed at 617,500 francs.

FRENCH WEST AFRICA. A vast territory, comprising the colonies of Senegal, French Guinea, Ivory Coast, Dahomey, Upper Senegal-Niger, and the Civil Territory of Mauretania. Its area has not yet been determined. Its total population is estimated at 13,000,000. For particulars respecting areas and populations, products, imports and exports, railways, telegraphs, etc., see under the respective titles. French West Africa is the only French colony to which a special tariff has been accorded. In 1907 the total imports and exports were valued at 94,801,000 and 79,764,000 francs respectively, the trade with France being represented by 43,115,000 francs of imports and 45,285,000 francs of exports. The administration is in the hands of a Governor-General—in 1908, A. W. Merland-Ponty—under whom are the Lieutenant-Governors of the various colonies and the Commissioner of Mauretania. The general budget of the Governor-Generalship is distinct from that of the various colonies. The revenues for the general budget are derived from customs and port dues, and the expenditures are for general services only. The revenues of the separate colonies are derived from the capitation tax, trading licenses, etc., and are devoted exclusively to local expenditure. The expenditure of France on French West Africa in 1908 was fixed at 15,787,940 francs, mostly for the army. The debt of French West Africa amounted in 1907 to 68,949,000 francs. The seat of the Governor-General is at Dakar, Senegal. There is a uniform school system, maintained from the general revenue. The military force, mostly natives, numbers over 9,000.

FRIENDS, THE; or SOCIETY OF FRIENDS, often called **QUAKERS**. A denomination of Christians which had its beginning about 1647 from the preaching of George Fox. There are four bodies of Friends in the United States: the so-called Orthodox, the Religious Society of Friends, to which the name Hicksite is sometimes given by those outside of the denomination, the Wilburite, and the Primitive. They differ chiefly in matters of church administration. The largest branch in point of numbers is the Orthodox, which numbered in 1908 97,836 communicants

and 830 churches. This body has fourteen yearly meetings in the United States and one in Canada. Thirteen of these are combined in a federation known as the Five Years' Meeting. This body met at Richmond, Ind., Oct. 5, 1907, and will convene its next meeting at Indianapolis in 1912. The Orthodox branch has ten colleges under its control, the best known of which are Haverford College for men, Earlham College for men, and Bryn Mawr for women. The Religious Society of Friends had in round numbers in 1908 20,000 members with 183 churches. The society has under its auspices Swarthmore College, together with 13 preparatory and 12 secondary schools. Ten Friends' Homes, partly sustained by endowments, are maintained. During the year a new Monthly Meeting was established at Pasadena, California, which is the first of its kind belonging to this branch of Friends on the Pacific coast. In September the biennial General Conference was held at Winona Lake, Indiana. For the first time since the so-called "separation" fraternal delegates were present from both the Orthodox and Wilburite Friends. There was unusual activity in the philanthropic interests of the society in 1908, especially in temperance work. The Wilburite branch numbered in 1908 4,468 communicants and 38 churches. It has seven yearly meetings, each of which is independent, relations between them being maintained by an annual exchange of epistles. The Primitive body is very small. It numbers 232 communicants and 11 churches. Missions are carried on by the Orthodox branch in 12 countries and contributions are made for the maintenance of 115 missionaries and 200 native workers. Among the institutions maintained by this body are the Friends' Asylum for the Insane, Frankford, Pa.; the Germany Dispensary and Hospital; the Pennsylvania Hospital for the Sick and Indigent; the West Philadelphia Hospital for Women. Homes for the aged, widows, and orphans are also maintained. The official organ of the Orthodox Friends is *The American Friend*, published in Philadelphia. The Religious Society of Friends publish the *Friends' Intelligencer*, also located in Philadelphia.

FRUIT GROWING INDUSTRY. See **AGRICULTURE**.

FRUIT PRESERVING. See **HORTICULTURE**.

GAMBIA. A British colony and protectorate on the west coast of Africa. Area, 3,619 square miles; population (1901), 90,354. The area of the colony proper is 4 square miles, and the population 13,456 (198 white), of whom 7,707 were Mohammedans, 5340 Christians, and the rest pagans. Bathurst, the chief town, had 8,807 inhabitants in 1901. Ground-nuts constitute nine-tenths of the exports. The imports and exports in 1907 amounted to £295,991 and £290,648 respectively, the trade with Great Britain being £155,761 for imports and £25,221 for exports, and with France £58,610 and £238,488. The revenue and expenditure in 1907 amounted to £65,892 and £57,729 respectively. The Governor in 1908 was Sir George C. Denton.

GAME LAWS OF 1908. As regular legislative sessions were held in only a few States—Massachusetts, Rhode Island, New Jersey, Maryland, Virginia, South Carolina, Georgia, Mississippi, Louisiana, Kentucky, Ohio, and Oklahoma—in 1908, the amount of game legislation enacted was much smaller than in the year previous. Game laws were under consideration

in all of these States and also in North Carolina, where a special ten days' session was held, but Kentucky, Mississippi, and Oklahoma made no changes in their game laws. Including Alaska, for which a new law was passed by Congress, the number of States which made changes in their game laws in 1908 was only ten, all except Louisiana being east of the Mississippi River.

In Canada at least six, or two-thirds, of the provinces amended their game laws. Including Canadian bills, and amendments passed by Newfoundland, the total number of new laws was less than sixty, and about half of these were local measures.

Among the novel features of the year's legislation were the act of Congress providing hunting and shipping licenses for Alaska, the first measure of the kind ever passed by the Federal government; the Quebec provision making lumbermen responsible for infractions of the game laws by their employees; and the Massachusetts requirement that the carcasses of deer killed in the protection of crops must be delivered to the city or town clerk on the day of killing.

In British Columbia the Lieutenant-Governor was authorized to set aside tracts of crown lands for game reserves and to make necessary regulations therefor.

The most important changes in close seasons were the prohibition of spring shooting of waterfowl in Northern New Jersey, and shore birds in Rhode Island, and the abolition of summer woodcock shooting in New Jersey. New York, Virginia, and Newfoundland abolished local seasons for rabbits, and substituted therefor a single season throughout the State. Similar action was taken by New York with all its upland game. In New Jersey, Massachusetts, Louisiana, and Manitoba the seasons for various kinds of game were shortened. In several States the close seasons maintained for a period of years for certain kinds of game expired in 1908, but most of the close terms for big game, grouse, and pheasants were extended.

A marked tendency was shown in the legislation of the year to increase restrictions on the marketing of game, especially in Louisiana, Ohio, Virginia, and Newfoundland, which placed further limitations on the sale of game. Ohio for the first time cut off the sale of all game, and Virginia of all upland game birds. The privilege of carrying out a limited amount of game is granted to non-resident licenses by New Jersey and New York.

Resident hunting licenses were established for the first time in Louisiana, Massachusetts, New York, and Nova Scotia, and alien licenses in Alaska, New Jersey, and New York. Non-resident licenses were prepared for Alaska, and those of Louisiana, New York, and British Columbia were increased. South Carolina established a county license in addition to its State license. In Alaska provision was also made for licensing guides and for the issue of shipping licenses for big game. Imitation or loan of the hunting licenses is made a forgery by the New York law.

Important changes in the laws relating to the warden service were made in Louisiana and Nova Scotia. In Louisiana a board of three commissioners was established, with headquarters at New Orleans, and in Nova Scotia a similar board was established composed also of three members. In both cases these boards appoint the wardens and supervise the inspection of the game laws.

An important item was incorporated in the agricultural appropriation bill, setting aside \$30,000 for the purchase of not more than 12,800 acres of land on the Flathead Indian Reservation in Montana for a national bison range, and \$10,000 to cover the cost of fencing.

GARBAGE AND REFUSE DISPOSAL.

The principal change in the collection and disposal of garbage and other city refuse during 1908 was the completion of several garbage or refuse destructors of the British type for cities of the United States. In 1907 in the comparatively small number of furnaces used for this purpose the American type was used almost exclusively. Another change for the better was a slight increase in the recognition of the fact that the collection and disposal of city wastes is an engineering problem which must be entrusted to engineers for solution. In American cities, the collection of garbage, ashes, and rubbish of all sorts is still generally entrusted to contractors, when done at public expense. Otherwise, it is commonly left to private scavengers, under little or no effective public regulation. In Great Britain, municipal collection at public expense generally prevails. Authorities on the subject generally agree that municipal collection should be the rule, efficiency considered, but it is a mooted question whether public or private collection costs the taxpayers the least, the work being equally well done in each case. Disposal of garbage and other city wastes is still on a very unsatisfactory basis in most American cities. The common method of disposal is by dumping on land or in water, at the handiest available point. Between a third and a half of the cities of the United States having a population of 30,000 and upwards have adopted either cremation or reduction for some portion of their garbage, but even in these cities the final disposal of ashes and rubbish is more or less a matter of chance.

While European cities in large numbers are far ahead of American in the disposal of municipal refuse, a large percentage of the refuse of many of them is not burned in their refuse destructors. Instead, large quantities of mixed refuse are dumped or "tipped" in heaps in out-of-the-way places, and some of the best of the mixed refuse, as well as some of the garbage, is plowed into land, either for fertilizing purposes or to improve the texture of the soil. The sixty-odd American cities of 30,000 population and upwards which in 1908 had improved means of garbage disposal were divided about equally between cremation and reduction, but most of the larger cities employed reduction rather than cremation. Reduction was the prevailing method of garbage disposal in New York, Chicago, Philadelphia, Boston, Baltimore, and Cleveland, the latter city having the only municipally-owned reduction plant in the country. San Francisco (before the earthquake), Milwaukee, and Minneapolis afforded the chief examples of cremation, in point of tributary population. The best plants employing either cremation or reduction, when under proper engineering rather than political supervision, give good sanitary results. Cost data for either method of treatment are meagre and unsatisfactory. All the reduction plants save one are privately owned and their financial results are carefully guarded—the more so because, although the grease and fertilizer base derived from the garbage yield a revenue, yet

the company-proprietors almost invariably demand and secure a bonus from the city which they serve. The Board of Public Service of Cleveland, O., publishes physical and financial reports on the operation of the reduction plant owned by that city, but although the figures given are valuable, the financial items are not quite complete. The newer American garbage-burning plants in 1908 were in operation too short a time to yield reliable cost data, and accounts worthy the name have been kept for but few, if any, of the older garbage furnaces. The best of the recent British refuse destructors were scientifically designed furnaces, with forced draft and other devices to secure the high temperatures (1500-2000° F.) without which municipal refuse cannot be properly burned, and with boilers and economizers to utilize these high temperatures.

Similar destructors were put in operation in 1908 to burn a portion of the garbage of Seattle, Wash., and to serve the West New Brighton section of the Borough of Richmond, New York City (see *Engineering News*, Nov. 5, 1906, for description of last-named plant, with results of official tests). Considerable information on garbage and refuse disposal, with reference to New York City, and to foreign practice, and with recommendations for New York, may be found in the *Report of Commission on Street Cleaning and Waste Disposal*, by H. de B. Parsons, Rudolph Hering, and Samuel Whinery of New York City, all prominent engineers, dated Dec. 31, 1907, and addressed to the Mayor of New York (see *Engineering News*, Apr. 23, 1908, for a lengthy abstract).

GARDEN, MARY. A Scotch-American operatic singer. She was born in Scotland, in 1876, and was brought to Chicago in 1882. Her first musical studies were upon the violin and piano, but in 1895 she went to Paris to study singing. In 1902, owing to the illness of one of the singers at the Opéra Comique, she was called upon at short notice, and made her debut singing the title rôle in Charpentier's *Louise*. The following week she was installed as a principal at the Opéra and remained there for six years. On Nov. 25, 1907, she made her first American appearance at the Manhattan Opera House, New York, singing the title rôle in Massenet's *Thaïs* (its first American hearing). She also introduced *Louise*, Debussy's *Pelléas et Mélisande* and Massenet's *Le Jongleur de Notre Dame*, to American opera-goers.

GARDEN CITIES. See ARCHITECTURE.

GARFIELD, HARRY AUGUSTUS. An American educator, became president of Williams College, on Oct. 7, 1908, for which position he had been formally chosen in June, 1907. He was born at Hiram, Portage County, Ohio, on Oct. 11, 1863, the first son of President James A. Garfield. He graduated from Williams College in 1885. He studied law for a year (1886) at the Columbia Law School, and then at Oxford University and the Inns of Court, London, and was admitted to practise at the Ohio bar in 1888. He practised law (as a member of the firm of Garfield, Garfield, and Howe) in Cleveland, Ohio, in 1888-1903, and was professor of politics at Princeton in 1903-08. In 1898-99 he was president of the Cleveland Chamber of Commerce, and from 1899 to 1908 he was chairman of the special commission on the reorganization of the United States consular ser-

vice. Mr. Garfield is the first layman to be president of Williams. His immediate predecessor was Dr. Henry Hopkins (q. v.).

GARY. See IRON AND STEEL.

GARY, FRANK BOYD. United States Senator (Democrat) from South Carolina. He was born at Cokesbury, S. C., on Mar. 9, 1860, attended the Cokesbury Conference School and in 1877 entered Union College, N. Y., but was obliged to leave that institution in his senior year because of ill health. He then took up the study of law at Abbeville, S. C., and was admitted to the bar. In 1890 he was elected to the State Legislature, and he was a member of that body continuously until 1900, having served as Speaker from 1895 to 1900, when he became a candidate for Governor. In 1906 he was again elected to the Legislature. On Mar. 6, 1908, he was elected United States Senator to fill the vacancy caused by the death of A. C. Latimer. His term will expire on Mar. 3, 1909.

GAS. In 1908 the United States Geological Survey issued a report on the gas industry and the production of coal and water gas for the year 1907. This report stated that the statistics for the coal gas production in 1907 were compiled from returns made by 516 companies and by 3892 product ovens. The number of companies showed a decrease over 1905, when the last report on gas was prepared by the Geological Survey, but this was explained as due to consolidations of companies, to the change of plants from coal gas to water gas, and to the change from gas to electricity for illuminating purposes in certain comparatively small towns. The coal gas production in 1907, exclusive of that lost or unaccounted for, was 54,819,685,000 cubic feet as compared with 40,454,000,000 cubic feet in 1905, or an increase of gas sold in two years of 35 per cent. Coal gas, it will be remembered, is prepared by the distillation of coal in retorts, while water gas, on the other hand, is produced by the decomposition of water in the form of steam at intense heat, and then subsequently enriching the hydrogen thus produced for illuminating purposes. The statistics of water gas production showed an increase in the number of companies from 477 in 1905 to 520 in 1907, and the production, exclusive of that lost or unaccounted for, increased from 82,959,228,504 cubic feet to 162,139,874,507 cubic feet. The loss of water gas amounted to 7,505,000,000 cubic feet or somewhat over 7 per cent. of the production.

The average price of coal gas in 1907 was 67 cents per thousand feet, while that of oil and water gas was 95 cents per thousand cubic feet, as it is used more for illuminating purposes.

During the year there was much consideration of gas companies and their methods by public utilities commissions, but less positive progress and results were to be recorded than in previous years. During the year the United States Supreme Court was passing on the constitutionality of the act establishing the 80-cent per thousand rate for the boroughs of Manhattan and the Bronx, and a decision was anticipated early in 1909. The question at issue was as to the confiscatory character of the legislation, and the decisions of the lower courts had been for the most part in favor of the consumer. The use of incandescent lamps for gas lighting continued to extend, and the industry, in the main, was in good condition, except in so far as it was

apprehensive of hostile legislation and restrictions.

BLAU GAS. During the year announcement was made of a new gas available for illuminating, heating, and power purposes named Blau gas after its inventor, a German chemist. Blau gas is a compressed gas mixture where those gases rich in carbon which liquefy under pressure have not been eliminated as in the usual forms of compressed gas, and as these are the most valuable for heating and lighting, it was found that they could be included in a mixture of various liquefied gases which in this state will dissolve large quantities of hydrogen and methane. The gas mixture is prepared by distilling coal at a temperature much lower than that used in making ordinary coal gas and then purifying and compressing the product. The mixture contains the liquefied heavier gases saturated with the permanent gases and is put on the market in steel cylinders, containing from $\frac{1}{2}$ a kilogram to 25 kilograms, a 10-kilogram or medium-sized cylinder containing 22 litres of the liquefied gas being 3 feet in height by 5 or 6 inches in diameter and affording sufficient gas to supply a 50-candle incandescent burner for 480 hours, as compared with 32 gallons of kerosene for an oil lamp of equivalent candle power. The cost is stated at about 15 cents a kilogram. The liquefied gas has a specific gravity of .59, but the gas where liberated is slightly heavier than air. It is especially effective for use in incandescent gas lamps.

GAS ENGINES. During 1908 there was in course of erection at the new works of the Indian Steel Co., at Gary, Indiana (See IRON AND STEEL), the largest power plant ever designed or built for utilizing the waste gases from blast furnaces. The use of gas engines on a large scale in America first was tried at the works of the Lackawanna Steel Co., at Buffalo, and subsequently was taken up in earnest by the United States Steel Corporation and a number of large gas engines were installed in works at or near Pittsburg and at the Illinois works at Chicago. The Gary plant consists of 16 500-ton coke blast furnaces from which are produced daily about 44,800,000 cubic feet of gas, a part of which is used for heating the blast stoves, for raising steam under boilers, and for various auxiliaries, but the major part, 57.5% of the total production, is available for the blowing engines and for the generation of electric power to operate the works. The latter is the most important item, and when all the furnaces are in operation there will be produced for this special object over 200,000 horse-power. This power plant both for its size and the design of the engines is remarkable, and was expected to insure great economies in the operation of the works.

MARINE GAS ENGINES. During the year there was much discussion as to the use of gas engines to propel ships, and some extensive tests were made. Notable among them was the fitting of gas engines and producer to H. M. S. *Rattler*, an old, small British gunboat of 715 cons displacement, and the decision to equip the new magnetic survey yacht of the Carnegie Institution with internal combustion engines of 125 indicated horse-power and a gas producer. The *Rattler* was not a very large craft, being 165 feet in length and of 29 feet beam, but with 500 horse-power suction gas engines and producer, an average speed of 8 to 9 knots, or the same as made before with steam engines

under natural draft, was obtained with one-half the coal consumption and a much smaller engine-room force. It had a single set of vertical Beardmore-Capitaine suction gas engines and producer. The type chosen was a 5-cylinder single-acting suction gas engine and producer of 500 brake horse-power, the cylinders being 20 inches in diameter by 24 inch stroke and operating at 120 revolutions per minute. The advantages of gas engines of large size on ship-board were essentially a saving of one-third in the space occupied by the machinery and a reduction of possibly one-fourth in its weight, as where the engines are heavier the boilers are much lighter than the producers. Furthermore, there would be considerable economy, as not only can greater horse-power at the propeller per pound of fuel be obtained, but a cheaper grade can be used. In addition, there was not needed the same force of stokers and the operation of engines and producers is far simpler and easier. On the other hand, the disadvantages urged were the extreme high temperature of the cylinders with the corresponding effect on valves, the great weight of the moving parts, and the difficulty of making the engines reversing. The gas engine was also said to be lacking in flexibility for the various degrees of service to which a marine engine is submitted. Such mechanical disadvantages as an uneven turning moment and the regulation of the power to variation in the resistance were also brought forward. The disposal of the exhaust from a marine gas engine also presented difficulties and the danger of leaks in the crew were also presented.

GAS, NATURAL. See NATURAL GAS.

GATTI-CASAZZA, GIULIO. An Italian impressario. He was born in Ferrara, Italy, about 1869, and became president of the municipal opera house in Ferrara at the age of twenty-four. In 1898 he became director at La Scala in Milan. Under his direction Wagner's *Nibelungen* cycle as well as Strauss' *Salome* and Debussy's *Pelléas et Mélisande* were first heard at Milan. On Feb. 11, 1908, he became director of the Metropolitan Opera House in New York City.

GAUDRY, JEAN ALBERT. A French paleontologist, died on Nov. 29, 1908. He was born in Saint Germain-en-Laye, on Sept. 16, 1827, and after travelling in 1853-60 in the Orient and in Greece, where he did much paleontological research work, became a professor in the Museum of Natural History, at Paris, in 1872. In 1882 he was elected to the French Academy of Sciences. His publications include, *Recherches Scientifiques en l'Orient* (1855); *Animaux fossiles et géologie de l'Attique* (2 vols., 1862-67); *Animaux fossiles du Mont-Léberon*, with Fischer and Tournouër, and *Enchaînements du monde animal dans les temps géologiques* (1878).

GEBHART, ÉMILE. A French writer, member of the French Academy, died on April 21, 1908. He was born at Nancy on July 19, 1839, and attended the Lycée at Nancy and the École Française d'Athènes. In 1860 he became professor of foreign literature at Nancy and in 1879 professor of the literature of Southern Europe in the Faculty of Letters at Paris. His writings deal chiefly with antiquity, ancient art, and the history of literature. He also contributed to the *Revue des Deux-Mondes*, the *Revue Bleue*, and the *Journal des Débats*.

GEOGRAPHICAL SOCIETY, AMERICAN. A learned society for the encouragement of geographical discovery, the dissemination of geographical information, and the maintenance of a place where the means will be afforded of obtaining information, organized in 1852. The society has a house at 15 West 81st Street, New York City. Its membership in 1908 was about 1,400. The President is Archer M. Huntington; Vice-Presidents, D. D. Mills and John Greenough; Corresponding Secretaries, foreign, William Libbey, domestic, Archibald D. Russell; Recording Secretary, Anton A. Raven.

GEOGRAPHIC SOCIETY, NATIONAL. A learned society for the publication of the results of geographic exploration and research, founded in 1888. Its data is published in an illustrated monthly magazine, and it publishes in addition large maps and various books. It maintains a library at its headquarters in Washington, where gold medals are awarded and a series of addresses is given. Its membership is about 36,000. The President is Willis L. Moore, the Secretary, O. P. Austin, and the editor, Hubert H. Grosvenor.

GEOLOGICAL SOCIETY OF AMERICA. A learned society, founded in 1888 for the prosecution and publication of studies in geology. It had in 1908 298 fellows. The President is Samuel Calvin; Treasurer, Wm. Bullock Clark; Editor, J. Stanley Brown; Secretary, E. O. Hovey, American Museum of Natural History.

GEOLOGY. Progress in geology during 1908, as in the preceding year, was based upon a wide activity in research and descriptive work, rather than upon signal gains along any particular line. Material additions were made to the literature of each department, out of which only the more important investigations have been selected for discussion here, though they may be considered as fairly representative of the general trend of the science.

DYNAMICAL GEOLOGY. The investigation of radio-activity in relation to the physics of the earth's crust has continued to attract attention. In the review of geology for the year 1907 an account was given of an examination of rocks and minerals from various parts of the world by R. J. Strutt, who found the average quantity of radium present to be many times in excess of that necessary to maintain the average temperature gradient of the crust. From this surprising result, which, if strictly interpreted, would overturn previous conceptions of a cooling earth, it was concluded that the surface rocks are not to be considered as affording an average, but that the radium is concentrated in the outer portion, while the earth's interior may be relatively free from the element. With the almost ceaseless outflow of energy that characterizes radium, and the all but eternal source of it afforded by uranium, it was believed that there can have been only a small diminution in the radio-activity of the earth during so long a period as one hundred

millions of years. J. Joly continued the investigations of Strutt by examining especially the deep-sea deposits. In the characteristic materials known as globigerina ooze, radiolarian ooze, and the red clay brought up from great depths, the radio-activity was found to be greater than that shown by rocks from the land surface. While recognizing that this new source of heat was an important factor in the problem, Prof. Joly believed that former theories regarding a cooling earth were not to be superseded. On the other hand the discovery affords a means of reconciling the physical and geological views of the matter on the Kelvin hypothesis. While Lord Kelvin was not inclined to concede a greater age for the earth (estimated from the physics of a globe cooling by radiation) than forty or fifty millions of years, it is now possible to lengthen the time to twice that amount. It may be said that geologists have generally been in favor of a longer interval than Kelvin's estimate. According to Joly the loss of heat by radiation during the early period of the earth's history was greater than the effect of the radio-thermal activity. From such a state conditions have tended to converge, the rate of loss by radiation diminishing while the radio-thermal output remained fairly constant, until the existing distribution of temperature has been attained. The radio-thermal supply may now nearly balance the loss by radiation.

In discussing the influence of radium upon the geology of the globe, G. F. Becker calls attention to the distribution of the chemical elements in the universe as revealed by the spectroscope. It is found that the elements of highest molecular weight are the latest to be formed and are confined to cooling stars or planetary bodies, while those of the lowest molecular weight are present in nebulae and bodies at a high temperature. This indicates progressive evolution in the formation of the elements. A new calculation of the age of the earth based on the hypothesis of a globe not of uniform initial temperature, as assumed by Kelvin, but one of which the initial temperature increases directly as the distance from the surface, gives a result of sixty millions of years. The present surface gradient of a globe under such conditions should be 1° C. in 42.2 meters, if influenced by cooling alone. Radio-activity may have a value of about one-tenth of that amount. The total heating effect of the radium present would be independent of its distribution, but it is considered that the uniformly radio-active shell is less than 10 kilometers thick. The source of uranium and its disintegration products, including radium, is in the granitic rocks, which are probably superficial.

The peculiar topographic feature represented at Cañon Diablo, Arizona, received an explanation after a study by G. P. Merrill. It consists of a crater-like depression in a region of horizontally-bedded sedimentary rocks which are free from evidences of volcanic activity. The crater is 4,000 feet in diameter and 500 feet deep. The surrounding strata show a strong outward dip for some distance and then regain their normal disposition. As there are no volcanic materials in the vicinity, the crater could hardly have been formed by a subterranean volcanic explosion and the only possible explanation is that it resulted from the impact of a gigantic meteorite. A meteoric mass of sufficient size to produce the cavity would be unique, and an

attempt has been made to locate it by exploration with the drill. Up to the present nothing more than fragments have been found. The energy developed by the impact may have been sufficient to destroy the mass in great part.

The growth of coral reefs, as exemplified by the Great Barrier of Australia, was under recent investigation. The development of an individual reef proceeds in a regular manner. If the reef reaches the surface with its axis along the prevailing direction of the winds, then the reef endures, but if across the wind its extremities, are produced backward, forming first a crescent, then an oval, later a horse-shoe and finally an oval enclosing a lagoon. Subsidence at this time may arrest development or rejuvenate the reef. In quiescence the lagoon walls broaden, the lagoon fills with sediment and the atoll is converted into a cay. The view of Darwin as to the growth of coral reefs upon a subsiding floor was upheld by the writers of the paper,—C. Hedley and T. Griffith Taylor,—who stated that the Queensland coast shows evidence of sinking and that the outward face of the reef shelves off abruptly.

GLACIAL GEOLOGY. A study of the Niagara gorge was made by J. W. W. Spencer with a view to determining the rate of its excavation by the recession of the falls. It has long been recognized by geologists that the gorge affords a basis for estimating one of the great divisions of geological time—the Post-Glacial period. As far back as 1845, Sir Charles Lyell prepared an estimate of the age of the falls, which he showed must have come into existence since the drift period. Assuming a uniformity of rate and conditions for the excavation, he held that the length of the gorge divided by the amount which the falls receded up-stream each year would give a measure of the time. This he estimated roughly at 35,000 years, but recognized the uncertainty of some of his data. Much additional information has been secured since Lyell's visit. An important factor, but a variable one, was recognized in the existence of a former river channel that is exposed at the whirlpool; the channel is drift-filled and would necessarily offer less resistance to the wearing action of the river than the hard rocks through which its course lies above the whirlpool. Spencer obtained soundings below the falls which show that a basin 192 feet deep exists. Below the basin the river shallows to 86 feet at the Cantilever Bridge, due to the filling up of the channel after the falls have passed up-stream. According to Spencer's calculation, the average recession of the falls over a period of 63 years, from 1842 to 1905, has been 4.2 feet per annum. The rate of retreat is not uniform, since the contour of the falls changes gradually from an angular notch to a broad curve when there is little recession for a time. As a result of his investigations, Spencer placed the age at 39,000 years. Some interesting statements are made regarding the varied history of the region during relatively recent geological times. While the present system of the Great Lakes and connecting rivers date from the retreat of the continental glaciers, it has undergone great changes at different periods in consequence of earth movements and variations of water level. When the waters of Niagara first flowed into the basin of Lake Ontario they had a fall of only 35 feet, since the lake then stood at a high level marked by its uppermost beaches. Niagara river was

then fed only by the overflow of a comparatively small lake occupying the lowest depression of the Erie basin. It had only 15 per cent. of its present volume. The drainage of the upper Great Lakes instead of passing through Lake Erie was discharged through a gap now represented by Lake Nipissing and the Ottawa river. This drainage system was interrupted by subsidence of the Lake Ontario basin and closing of the gap from Lake Huron into the Ottawa river, and a fresh channel was opened from the southern end of Lake Huron into Lake Ontario through a valley now covered up by drift. Further earth movements led in time to the closing of this outlet, so that the waters of Lake Huron were forced to pass out through Lake St. Clair and the Detroit river into Lake Erie. Thus, at length, Niagara received the over-flow of the Great Lakes. The capture of this discharge by the Niagara River is estimated by Spencer to have happened 3,500 years ago, when the falls were at Foster Flats. The excavation of the gorge from Queenston to Foster Flats, which was performed while the river received the drainage from Lake Erie alone, extended over a period of about 35,500 years.

In a paper on the Permian ice age, Prof. W. M. Davis called attention to the occurrence of glaciated areas in widely separated regions, including South America, Australia, India, and South Africa. From this fact it is argued that an explanation of the climatic conditions is not to be found in a possible displacement of the earth's axis. The present limitation of precipitation, for the South African glaciated area at least, to the warmer season is a further feature that cannot be overlooked. The full explanation of the problem involves not only a moderate reduction of temperature, but so strong a reduction that snowy precipitation may occur in the warmer season, or a more moderate reduction with a change of the season of precipitation from the warmer to the cooler part of the year. Under the present understanding of atmospheric circulation, the first of these alternatives seems the least puzzling.

Discoveries of human remains and crude implements of supposedly early date are reported from time to time from excavations in the Glacial deposits. The evidences bearing upon the antiquity of man in America found up to the present time, however, are not of decisive weight, and the best opinion, geological as well as anthropological, seems to be in accord that the remains and works of early man which have been unearthed belong to a much later period than the primitive types uncovered in the caves and Glacial beds of Europe. In a recent paper A. Hrdlicka gave his conclusions from an examination of a series of specimens including most of the remains supposed to be of established antiquity. According to this authority, the bones and skeletons closely resemble those of the modern Indian. The opinion was also expressed that America was peopled from the Old World, and that the migration could not have taken place until after great multiplication of the human species and the attainment on their part of some degree of culture. In regard to the latest discovery of the "loess" man in eastern Nebraska, Hrdlicka finds nothing that could not be explained as well on the assumption that the bones are comparatively recent. The Gilder mound in which the remains were found is situated just north of Florence along the Mis-

souri river. As described by E. H. Barbour, two distinct layers of remains existed in the mound, the lower containing five skulls in a layer of packed clay or loess at a depth of four or five feet and the upper three skulls and many bones of a more advanced man. The lower bones are described as showing evidences of wear by water action and gnawing by animals. The mound has also been examined by B. Shimek, who states that the remains are not in undisturbed loess, as first thought, but probably found their way into the mound by intrusion, having been carried down by water or by burrowing animals from the burial level.

STRATIGRAPHICAL GEOLOGY. The difficult problem presented by the Pre-Cambrian formations, which was recently under consideration by a committee of American and Canadian geologists, as reported in the review of geology for 1907, was further elucidated by C. R. Van Hise. After summarizing the present state of knowledge concerning the Pre-Cambrian rocks in the different regions, Van Hise advocated a dual classification based on physical features as the most satisfactory. The terms Archean and Algonkian are considered to have precedence and are to be preferred by reason of their clear definition and general applicability. Under Archean is grouped the basal complex, composed dominantly of igneous, largely volcanic, rocks, with which sediments are sparingly associated. At the time of their formation it is believed that the physical conditions on the globe were not yet favorable to the extensive deposition of sedimentary strata, like those laid down in subsequent periods. They are characterized, also, by more intricate structures (due to compression, folding and faulting) than the Algonkian rocks. The latter are prevailingly sedimentary and seem to have been deposited under conditions essentially the same as those prevailing at the present day. Their field occurrence can be worked out according to ordinary stratigraphic methods, which are only rarely applicable to the Archean formations. Whether or not the two divisions are paralleled by corresponding life groups can not now be stated, but if a dual zoic division should appear desirable the terms Archeozoic and Proterozoic are recommended. Another plan that can be adopted is to employ a single life term for the two physical divisions, in which case Proterozoic may be used.

F. D. Adams has given the results of a careful study of the Grenville series over an area of 4,200 square miles in eastern Ontario. The field lies on the margin of the Laurentian protaxis, north of Lake Ontario and east of Lake Huron. The series there consists of limestone, mostly of crystalline character, but grading into fine-grained, blue, less metamorphosed limestone, acidic gneisses, and schists, the whole representing a sedimentary accumulation of enormous thickness. In one section made across the prevailing direction of strike of the series, the measured thickness exceeded 90,000 feet, or nearly 18 miles. The Grenville thus contains the greatest development of Pre-Cambrian limestones in North America. It has also a wide areal distribution, spreading over a region of 83,000 square miles and including representatives in the Adirondacks and possibly on the shores of the Hudson Straits. The Pre-Cambrian limestones of New Jersey and the Hudson Highlands are probably of Grenville age. In regard to the stratigraphy of the series, Adams

finds evidence of the existence of two unconformable portions. It is concluded, however, that the Hastings series is a less metamorphosed phase of the Grenville, into which it seems to grade, and not a distinct group, as held by Miller and Knight. Sufficient knowledge has not yet been obtained to permit a correlation with the Huronian strata farther west.

ECONOMIC GEOLOGY. A map of the coal fields of the United States, published by the U. S. Geological Survey, embodied the details of new discoveries and more precise information regarding the older fields. For the first time the brown coal or lignite beds in the river basins of Colorado, Montana, Wyoming, and North Dakota are represented with a degree of accuracy. A new classification of coals is adopted, wherein two additional grade—semi-anthracite and sub-bituminous—are recognized, making six in all. Semi-anthracite is intermediate between anthracite and semi-bituminous, while sub-bituminous is the name given to black lignite intermediate between bituminous and lignite. Of great interest is the information concerning the available supply of coal in the country, to which so much attention has been given in discussion of plans for the conservation of the resources of the United States. The area of the more accessible fields is stated as 327,596 square miles, and their estimated content of coal easily available for mining at 2,004,000,000,000 tons. In preparing the estimate of tonnage, certain limits of depth and thickness of the seams are recognized, based on actual mining conditions abroad, especially in Belgium. The limit of depth is 5,000 feet for coal and 3,000 feet for lignite. The minimum thickness is fixed at 20 inches for coal and three feet for lignite. In addition to the quantity above given, there is an estimated supply of 1,153,000,000,000 tons of coal accessible with difficulty. The total output of coal in the United States, including the amount wasted in mining, up to Jan. 1, 1908, was 10,218,000,000 tons. If the rate of consumption increases in the future on the same scale as in the last fifty years, the supply of easily accessible coal will be exhausted before the middle of the next century.

That our coal beds have originated from organic materials, of chiefly vegetable nature, is no longer questioned by geologists. Yet it can not be said that there is the same unanimity of opinion regarding the processes that determined the vast accumulations of plant remains at certain periods in the history of the earth, or the various stages through which the plant materials passed in the change to coal. A summary of recent progress in the study of coal formation, prepared by David White, shows that much is being accomplished toward clearing up the different problems by refined methods of research. Opinion is still divided as to whether the coal-forming vegetation grew in place in the manner of peat bogs and swamps of the present day, or was brought together in deltas and littoral basins from some foreign, though probably nearby, source. Both theories may be applicable under the variable conditions of occurrence. The transformation of vegetable matter to coal is accompanied by a loss of oxygen and hydrogen and is accomplished in the first stage by a process of fermentation under the influence chiefly of micro-organisms, mostly bacteria. These penetrate into the cells of the woody structure and decompose all the softer parts, leaving only the more resistant materials like the cuticle, spore envelopes, and seeds im-

mersed in a dark sub-gelatinous mass. The bacterial decomposition may progress until the vegetable tissues are wholly changed into the gelatinous substance. This stage takes place always under water, whereas if there is access to air the vegetable material will be converted into humus or be completely destroyed by oxidation. The further conversion of the decomposition product, which is of the nature of peat, results from devolatilization under dynamic influences, such as pressure of overlying sediments, thrust movements in the strata, and intrusion of igneous rocks. While the succession from peat through lignite to bituminous coal and finally to anthracite may be the normal outcome of dynamic action on a uniform material, there are some authorities who maintain that the differences between the groups of coals are conditioned rather by the original character of the ingredients and the extent of the initial decomposition. Channel coals and splints, it is known, differ from the other coals by a relative scarcity of woody tissue, while they contain on the other hand a large proportion of spores and pollen grains. Bog-head coals, also, are characterized by remains of the thalli of various gelatinous micro-algæ, which in some cases make up nearly the entire mass. The presence of these organisms seems to be peculiar, as well, to many oil-shales of the older rocks and they have been the source, perhaps, of much of our petroleum and natural gas.

GEORGE JR. REPUBLIC. A successful experiment in practical philanthropy, begun in 1895 at Freeville, New York, by William R. George. Its objects are: "To prevent crime, to develop character, and promote good citizenship." The government of the Republic is modelled upon the government of the United States and is presided over by a President, who is assisted by a President's Cabinet. Practical affairs of the Republic are administered by citizens under the supervision of the officers. Each citizen works five hours a day and attends school five hours a day. The school curriculum includes a college preparatory course. The support of the Republic is practically from voluntary contributions and its affairs are conducted by the George Jr. Republic Association, which has about 1,400 members. The Republic is constantly filled to its capacity, having about 160 boys and girls, and a waiting list nearly equal to that number. In the property occupied by the Republic there are 350 acres with 30 buildings, including cottages, shops, and barns.

GEORGIA. One of the South Atlantic division of the United States, and one of the thirteen original States. Its total area is 59,265 square miles, of which 540 square miles is water surface. The population in 1900 was 2,216,331, of whom 46.7 per cent. were colored. The Federal estimate of the population in 1908 was 2,519,514. Local estimates of the population of the largest cities in 1905 were: Atlanta, 125,000; Savannah, 70,000; Augusta, 45,000; Macon, 40,000.

MINERAL RESOURCES. In Georgia there was produced in 1907, 444,114 long tons of iron, valued at \$837,102; of coke there were produced 74,934 tons, to the value of \$315,371, or a total value of iron ores and coke of \$1,152,473. The iron produced in 1905 amounted to 411,230 long tons. Among other metallic and mineral products for 1907 were the following: Coal, short tons, 362,401, valued at \$499,686; sand and

gravel, short tons, 226,290 tons, valued at \$81,991; clay products were produced to the value of \$2,490,237; sand-lime brick, \$89,582. This State is surpassed only by Vermont in the quarrying of marble. In 1907 the output of stone, including limestone, granite, and marble, was valued at \$1,745,638. Talc and soapstone were produced to the value of \$11,473; glass sand, 4,800 tons, valued at \$4,800; lime, 18,349 tons, valued at \$70,826; ochre, 5,600 short tons, valued at \$57,100. Georgia is one of the three important States in the production of bauxite, while the production of asbestos in the State, together with that produced in Virginia, constitutes two-thirds of the output of the country. There was produced in 1907, asbestos, natural and Portland cement, bauxite, barytes, fullers' earth, mica, graphite, pig iron, pyrite, precious stones, copper, and lead to the value of \$1,501,361. Gold was produced in 1907 to the value of \$64,800, from 3,135.09 fine ounces. There was mined in the State 864 fine ounces of silver, valued at \$570. The value of the mineral waters produced in the State in 1907 was \$28,120. The total value of the mineral production for that year, including all those mentioned above, was \$7,798,665. According to figures of the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production of the State in 1907 was \$6,541,003, as compared with a value in 1906 of \$8,927,361.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal crops in 1908 were as follows, according to figures of the United States Department of Agriculture: Corn, 53,750,000 bushels, valued at \$44,075,000 from 4,300,000 acres; winter wheat, 2,208,000 bushels, valued at \$2,672,000 from 240,000 acres; oats, 5,160,000 bushels, valued at \$3,715,000 from 300,000 acres; rye, 122,000 bushels, valued at \$152,000 from 14,000 acres; rice (rough), 87,500 bushels, valued at \$195,375 from 3,500 acres; potatoes, 780,000 bushels, valued at \$858,000 from 10,000 acres; hay, 152,000 tons, valued at \$2,181,000 from 87,000 acres; tobacco, 2,705,625 pounds, valued at \$1,946,969 from 2,575 acres. The acreage and production of corn was slightly less in 1908 than in 1907, when the figures were respectively 4,426,000 acres, and 57,538,000 bushels. There has been a great increase in the acreage of corn in the State since 1900, while the acreage devoted to rice has greatly decreased, owing to the general decline of the rice industry along the Atlantic coast, following its rapid development in Louisiana and Texas. Cotton is the most valuable agricultural production of the State. In 1908 the estimated production was 1,844,000 bales, which was a considerable increase over the figures for 1907, 1,667,866 bales. Other valuable crops of the State are peanuts, sweet potatoes, and fruit. Farm animals on Jan. 1, 1909, numbered as follows: Horses, 140,000; dairy cows, 311,000; other cattle, 680,000; mules, 241,000; sheep 258,000; swine, 1,615,000. All varieties have increased considerably in numbers since 1900. The estimated value of the wool clip in 1908 was \$189,000.

MANUFACTURES. The progress of manufacturing in Georgia from the census of 1900 to the special census of 1905 was very notable. The latter census, which included only factories, showed 3,219 such establishments, with \$135,211,551 of invested capital, an average of 92,749

wage-earners, and products valued at \$151,040,455. These four items were, respectively, 6.8, 70.5, 11.3 and 59.8 per cent. greater than the corresponding items for 1900. Of the wage-earners, 12,640 were women at least 16 years of age, and 7,295 were children under 16, these two classes of laborers having increased, respectively, 25.5 and 17.2 per cent., 1900 to 1905, while the number of men employed increased only 8.6 per cent. The leading industries, with the value of products of each in 1905, were as follows: Cotton goods, \$351,174,248; lumber and timber products, \$14,435,563; cottonseed oil and cake, \$13,539,899; fertilizers, \$9,461,415; flour and grist mill products, \$8,178,926; turpentine and resin, \$7,705,643; planing mill products, \$6,618,544; foundry and machine shop products, \$5,587,811; and railway shop work, \$4,775,109. The industry showing the greatest development was the manufacture of cotton goods, in which Georgia now ranks fifth. In this industry there were in 1905 103 establishments, \$42,349,618 capital, and 24,130 wage-earners, an increase over 1900 of 75.3 per cent. in capital, 32 per cent. in wage-earners, and 90.6 per cent. in the value of products. The increase in the value of the lumber and timber products between the two censuses was 25.3 per cent. About 90 per cent. of the total value came from yellow pine, 6.8 per cent. from cypress, and the remainder from oak and poplar. In the manufacture of cottonseed products, Georgia ranked second in both 1900 and 1905. In this industry the number of establishments increased from 43 in 1900 to 112 in 1905, and the value of products increased 67.9 per cent. The value of fertilizers during the same time increased 181 per cent. Georgia ranked first in the production of turpentine and resin in 1900, and second in 1905. During this period the value of the products fell 5 per cent. Nevertheless in 1905 Georgia produced 9,542,316 gallons of spirits of turpentine and 1,104,968 barrels of resin, or 31.1 and 31.5 per cent., respectively, of the total for the United States.

EDUCATION. In 1906, the last year for which statistics are available, the school population numbered 729,000. There were enrolled in the public schools 307,494 white and 208,774 colored pupils, while 199,311 white and 119,430 colored were in average attendance. The number of schools for whites was 4,713, and for colored, 2209. The white teachers in the State numbered 7,095 and the colored, 3,457. There has been a marked improvement in the last two or three years in the school buildings and equipment in the State. The compulsory education law, which went into effect in 1908, was attended with excellent results. The Legislature in 1906 made provision for district agricultural high schools, and in the work of these schools excellent results have been attained.

FINANCE. The statement of the Treasurer showed a balance Jan. 1, 1908, of \$820,740.17. The receipts for the first nine months of the year were \$3,688,510.49 and the disbursements, \$4,127,695.03, leaving a balance Sept. 30, 1908, of \$301,555.03. The principal receipts were from the general tax, rent of the Western and Atlantic Railroad, hire of convicts, and the railroad tax. The principal disbursements were for common schools, pensions, interest on debt, and purchase of bonds.

CHARITIES AND CORRECTIONS. Many important measures relative to charities and corrections were passed by the Legislature of 1907. The

establishment of a municipal farm for persons convicted of minor misdemeanors, and juvenile offenders, was authorized. An appropriation of \$25,000, of which \$1,000 was available in 1908, \$12,000 in 1909, and \$12,000 in 1910, was made for the establishment of a State Sanitarium for Tuberculosis; children's courts were established as branches of the superior courts and a parole or conditional pardon system was put into effect. A sweeping change was offered in the penal system of the State by a law which puts an end to the leasing of convicts to private individuals and corporations, and provides that after April 1, 1909, all convicts, both for felony and misdemeanors, shall be worked by the counties on the public roads, or by the Prison Commission on the State Farm property. Provision is made for the manufacture by convicts of supplies for State institutions, but otherwise their labor is not permitted to come into competition with other skilled labor. The Prison Commissioners are required by this law to visit the county convict camps once in six months for thorough inspection, and four inspectors in addition are provided for. For the State Sanitarium an additional appropriation of \$15,000 was made available in 1908, and \$30,000 in 1909. For the Soldiers' Home an additional appropriation of \$2,000 available in 1908, and \$3,000 in 1909, was made. The sum realized from part of the property is to be used in maintenance and improvements. Charity Organization Societies were established during the year in Rome, Columbus, and Augusta.

POLITICS AND GOVERNMENT. The prohibition law of 1907 went into effect throughout the State on January 1, 1908. Efforts were made to secure injunctions to prevent the operation of the law in Atlanta, pending litigation, but Judge Newman of the United States Circuit Court refused to grant such an injunction. Several difficulties in the enforcement of the law occurred during the year, and in the cities of the State, generally speaking, but little attention is paid to the law as far as the sale of beer is concerned. "Locker clubs" are prevalent. Except in Savannah, however, the open saloon is eliminated. The most important event in the political history of Georgia in many years was the passage at a special session of the Legislature of a bill which ended the convict lease system in the State, following the declaration of the State convention that nominated Joseph M. Brown for Governor. This act was signed by Governor Smith on Sept. 30. By the terms of this measure it is provided that the leases of convicts, which expire on Mar. 31, 1909, are not to be renewed, and that, after that date the Prison Commission "may use such remaining convicts in such a way as in their discretion they may deem for the best interests of the State"; this, however, to apply only to those convicts remaining after the counties have exercised their option of taking their pro rata part of the State's convicts for use upon the public works. Already it is assured that the county demand will far exceed the total number. The abuse of this system has long been a scandal to the State and its abolition, demanded by strong public opinion, was received with great satisfaction. The State will put practically the entire body of its convicts upon the public roads after April 1, 1909. See PENOLOGY.

CONVENTIONS AND ELECTIONS. In the Democratic primary elections held on June 3 to choose a

successor to Governor Hoke Smith, Joseph M. Brown defeated Gov. Smith, who was a candidate to succeed himself, by a majority of over 20,000. The defeat of Gov. Smith was generally attributed to his attitude toward the enforcement of the prohibition law, and to the opposition of the business and railroad interests of the State on the one side and to active antagonism of many of the extreme element on the other because of his alleged failure to carry out election pledges of the previous campaign. Mr. Brown was dismissed from the office of Railroad Commissioner by Gov. Smith. The Independence party, on Aug. 6, nominated Yancey Carter for Governor. In the State election held on Oct. 7, Brown was elected over Carter by a majority of about 75,000. Measures disfranchising negroes were carried. The Democratic State Convention met on June 23, and elected delegates to the National Convention. These were instructed to vote for William J. Bryan. At this convention Joseph M. Brown was formally nominated for Governor. There were two State conventions of the Republican party. The Republican State League, which was opposed to President Roosevelt, met on May 11, and elected four negro delegates, who were instructed to vote for Senator Foraker for President. The regular Republican convention met at Macon on May 14, and passed resolutions endorsing President Roosevelt's policies, but refused to instruct the delegates to vote for any particular candidate. In the national election on Nov. 3, William J. Bryan received 72,350 votes, William H. Taft 41,692, and Thomas E. Watson (Socialist) 16,965. The Republican vote showed an increase over that cast at the election of 1904 of about 17,000, or nearly 50 per cent.

In the election held at Atlanta on Dec. 2, James G. Woodward, the regular Democratic nominee, was defeated by Robert F. Maddox, an independent candidate put forward by a committee of citizens. About 12,000 votes were cast, and Maddox won by a majority of about 3,500.

OTHER EVENTS. A fire in Atlanta on May 8 destroyed property valued at \$1,250,000. Two business blocks were burned. Floods caused great damage in the State in the latter part of August. In Augusta alone the loss is estimated at \$1,000,000, with the loss of several lives.

STATE OFFICERS: Governor, Hoke Smith; Secretary of State and ex-officio Com'r of Public Lands, Philip Cook; Treasurer, R. E. Park; Comptroller and ex-officio Com. of Insurance, W. A. Wright; Adjutant-General, A. J. Scott; Attorney-General, Jesse C. Hart; State School Commissioner, Jesse M. Pound; Commissioner of Agriculture, Thos. G. Hudson—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Wm. H. Fish; Associate Justices, Horace M. Holden, J. H. Lumpkin, M. W. Beck, Beverly D. Evans and Samuel C. Atkinson; Clerk, Z. D. Harrison—all Democrats.

The State legislature of 1908 was composed of 44 Democrats in the Senate and 181 Democrats in the House. The State representation in Congress will be found in the article UNITED STATES, under the section *Congress*.

GERMAN BAPTIST BROTHERN. See BROTHERN IN CHRIST, CHURCH OF.

GERMAN EAST AFRICA. A German protectorate, between British and Portuguese East

Africa. Area, 365,600 square miles; population, 7,000,000. On the coast live 10,000 Arabs, Syrians, and East Indians. In 1907 there were 2,629 whites (1,656 Germans). The population of the principal towns in 1906 was estimated as follows: Dar-es-Salaam, the capital, 24,000; Tabora, 37,000; Ujiji, 14,000; Tanga, 5,680; Bagamayo, 4,978; Kilwa, 4,477; Lindi, 3,500; Pangani, 3,200; Iringa, 2,500. Government schools have about 3,200 pupils; mission schools, 16,500. Gold, copper, iron, lead, coal, salt, mica, garnets, agates, topazes, moonstones, etc., are found. In 1908 a rich gold deposit was discovered at Kirondabach, in the Wembre steppe, to the north of the Central East African railway now in construction. The forests, both of the coast and highlands, contain many valuable woods. The natives have large plantations of maize, pulse, and bananas, and rear large herds of cattle, sheep, and goats. The Germans have established plantations of coconuts, vanilla, coffee, cacao, tea, sugar, tobacco, rubber, cotton, and other vegetable fibres. The cotton production in 1907 was 510,679 pounds. The imports and exports in 1907 amounted to 23,806,000 and 12,500,000 marks respectively, against 23,153,000 (11,843,000 from Germany) and 10,995,000 (5,257,000 to Germany) marks in 1906. The principal imports are cotton and iron goods, rice, and beverages; the principal exports, rubber, hides and skins, sisal fibre, copra, wax, coffee, ivory, cotton, animals, copal, and sesame. At the end of 1907 there were 210 miles of railway and 1,500 miles of telegraph. The budget for 1908-9 balanced at 41,838,250 marks, of which 4,482,791 was an Imperial subvention. The military force in 1908 numbered 2,782 (2,510 natives). The Governor in 1908 was Baron von Rechenberg.

HISTORY. On Feb. 18, Herr Dernburg, Minister for the Colonies, in the course of his speech on colonial affairs, said that the condition of the natives in German East Africa was far from satisfactory. He declared that it was necessary to improve the judiciary in order to insure fair treatment of the natives, and he announced the appointment of a special commission to study their physical and mental capacities. As to Indian traders in the Colony, he said that they ought not to be excluded because they promoted the commercial development. He condemned the practice of the planters in pressing the natives into their service, and quoted a report to the effect that "it differed little from slave hunting on the Congo." The need of reforming the system of hiring labor was imperative, but still more important to the interests of the Colony was the creation of adequate means of transportation and communication.

GERMAN EVANGELICAL SYNOD OF NORTH AMERICA. A religious denomination, organized in 1840. It is a type of the State Church of Prussia, which represents a union of the Lutheran and reformed elements. The strength of the church is greatest in the Central and North Central States. In 1908 it numbered 237,321 communicants, 1,283 churches, and 1,007 ministers. In the denomination there are over 115,000 Sunday School Scholars. The property of the congregations is valued at about \$10,000,000. The publications of the church were formerly printed in the German language, but to meet the rapid Anglicization of the children of the church, books and periodicals are now published in English. Foreign missions are

actively carried on, and about \$24,000 is expended each year for this purpose. In 1908, \$22,826 were spent in domestic missions. The institutions of learning supported by the church include the Pro-Seminary at Elmhurst, Ill., and the Eden Theological Seminary at St. Louis, Mo. Charitable institutions are maintained for orphans, superannuated ministers, and for the widows and orphans of deceased ministers and teachers. There is a large Deaconess' Home at St. Louis, Mo. The official organs of the church are *Der Friedensbote*, and *The Messenger of Peace*. Several other periodicals are issued.

GERMAN LITERATURE AND DRAMA.

Reviews of the year's literary production in Germany are instructive in many points. Were the critics to be asked how many of the works recorded to them were remembered after a twelve-month, the reply would be discouraging to the authors. For while German literature to-day is teeming with intellectual suggestion, it seems to lack the emotional sincerity and imaginative vitality that create lasting impressions. The statistics of the book-market, too, teach valuable lessons. Only seven of the books of 1907 reached ten editions within a year and only nine of 1908. Only two of the great successes of 1907 continued to be reissued the following year. None of the seniors like Paul Heyse, Adolf Wilbrandt and Wilhelm Jensen attained that mark of success, but Peter Rosegger and Julius Wolff figured as rivals of their younger colleagues. Neither were books by the ultra-radical wing of the modern school among those frequently reissued. All this tends to show, that unless it is misguided by illegitimate advertising or by a sensational interest, the taste of the German book-buyer is likely to be sound.

DRAMA. Dramatic production presents similar features. With the exception of Wildenbruch's *Rabensteinerin*, no plays of 1907 seem to have much vitality. Yet Sudermann's one-act play *Rosen*, like his *Morituri* a collective title, were of a quality to reconcile one with the author of *Stein unter Steinen* and *Das Blumenboot*, and at least one of them. *Die ferne Prinzessin* had in it an element of popularity. Gerhart Hauptmann's *Kaiser Karl's Geissel*, a play founded upon the aged Emperor's passion for a young heathen hostage, likewise failed to rouse either human sympathy or literary interest. It is safe to infer that the authors have not so materially changed since their early successes, as their audiences. Being an effective vehicle for the problems of the period, the drama is an even better barometer of the varying tendencies and fashions of literature than the novel, and it would be useless to deny that the present time is a return to older standards rather than a revolt against them. Twenty years ago the German drama was the mouthpiece of a revolutionary young generation. If German authors to-day continue to cultivate the drama until its yearly output almost equals that of fiction it is likely that commercial considerations will affect their choice.

An event which never fails to stir up controversy is the awarding of the Schiller prizes. The royal prize, an institution since 1859, was last carried off by Wildenbruch in 1896. No candidate fulfilling the requirements in 1902, there were two prizes of 6,800 marks to be awarded this year. They went to the Austrian Karl Schönherr for his peasant drama *Erde*, and to the Prussian Ernst Hardt, for his Tristram

drama *Tantris der Narr*. There is some irony in the fact that the people's Schiller prize of 3,000 marks, which five years ago grew out of a spirit of protest against the royal award, was also given to Ernst Hardt and for the same Tristram play! Among the voices raised against the decision of the judges is that of Prof. Max Koch, who claims that Hardt disfigured the old myth by the introduction of modern sadistic traits. The peasant drama of Schönherr has been found wanting in the convincing vitality which characterizes the work of his unrivalled forerunner, Anzengruber.

Among the dramatists that followed in the wake of the literary revolution of the eighties, Ernst Rosmer (Frau Elsa Bernstein) has developed along technical lines and scored a success with her new play *Maria Arndt*. With amazing tenacity of purpose Frank Wedekind continues to moralize in his crude and brutal manner in his recent play of musical life, *Musik*. Max Halbe still enjoys the fruits of his early successes, but his new comedy, *Blaue Berge*, was a very weak effort at regaining the favor of the public. In a singular self-delusion, Detlev von Liliencron continues to court the dramatic muse, although his plays are but a frame for exquisite lyrical episodes. Both *Die Merowinger* and *Die Rantzau und die Pogwisch* would not have seen the footlights were not their author esteemed as the mastersinger of the younger generation. Many newcomers have been better received than members of that once so turbulent group. Ludwig Thoma, the chronicler of Bavarian life, owed the success of his *Moral* to the timely topic and obvious satire. *Der Fremdling von Murten*, by Emanuel von Bodmann, who was hitherto known only for his lyrics, augurs well for his future as a dramatist. After many years of struggle, Johann Wiegand has received the approval of serious critics by his historical drama *Thalea Bronkema*. Other dramatic novelties appealing to various interests and tastes were Stefan Zweig's tragedy of envy, *Thersites*, Albert Geiger's Biblical play *Das Weib des Urias*, *Sabbatai Zewi*, the tragedy of a Hebrew reformer by Schalom Asch, a Yiddish author, and the *Baldur* drama by Ludwig Fahrenkrog, the poet-artist whose Christ types have caused much discussion. The best comedy of the year was Emil Götts's *Mauserung*. Of the women who made their debut as dramatists, Johanne Wolf-Hamburg has been remarkably well received as the author of a serious play, *Die Meisterin*.

FICTION. In fiction the production of the year has been more satisfactory than in drama. The three deans of the German novel, Paul Heyse, Adolf Wilbrandt, and Wilhelm Jensen, have not failed to produce their annual volume. But while the recent works of the latter are decidedly inferior to their earlier works, Paul Heyse's short stories, *Menschen und Schicksale*, have all the human interest and the literary charm of the works of his prime. Sudermann has after more than ten years returned to the novel and challenges comparison with his earlier excellent stories, *Frau Sorge* and *Der Katzensteg*, in *Das hohe Lied*, in which he draws the same repellent pictures of moral depravity as in his plays. Georg von Ompteda roused himself to an effort surpassing his recent works in a strong novel of society, *Minne*. But E. von Keyserling is the greater artist and has given proof of his gift of preparing a dramatic situation by a suggestive atmosphere in *Dumala*.

The ruling tendency of modern German fiction is the evolution of a human soul from childhood to maturity. The more important recent novels are stories of a growth. Sudermann traces the development of a girl left in the world without protection. Ernst Heilborn in *Josua Kersten* tells, with sympathetic insight into his hero's soul, the story of an illegitimate child. Margarethe Böhme's *Apostel Todesscheit*, deserving a far more legitimate success than her *Tagebuch einer Verlorenen*, begins with the childhood of the hero, who is made to suffer for the sins of his forebears. Carl Hauptmann's *Einhart der Lächler* is the history of an artistic individuality doomed to spiritual solitude, yet endowed with an unlimited joy of life. Detlev von Liliencron's *Leben und Lüge*, called a biographical novel, reflects in Kai von Vorbrügge's childhood and youth the poet's own immature dreams and longings. It seems natural that these stories should be supplemented by others that treat the lives of the teachers molding the minds and souls of the young generation. Otto Ernst's *Semper der Jüngling* presents the later development of the hero of *Asmus Semper's Jugendland*. The book is his pedagogical credo, but the burden of ideas is lightened by a love element of exquisite tenderness and touches of delightful humor. Other teachers' stories are Wilhelm Arminius' *Stietz-Kandidat*, suggesting something of the spirit of Wilhelm Raabe, Walter Harlan's *Die Sünde an den Kindern*, and Heinrich Keller's *Unterlehrer Straub*.

Recent problem novels show a more artistic handling of their material than heretofore. A remarkable example is Arthur Schnitzler's admirable story treating the Jewish question, *Der Weg ins Freie*. Gabriele Reuter, in *Das Thränenhaus*, comes nearer to a story with an obvious ethical purpose than in any of her books since her classic of woman's life, *Aus guter Familie*, brought her into prominence; but she has learned the art of relieving the pathos of her argument by humor. Hermann Bahr's story of a boy's first love, *Die Rahl*, tactfully touches upon a problem seriously engaging the attention of modern parents and educators. More directly a "Tendenzroman" than any of these works is Max Burkhardt's plea for the abolition of capital punishment, *Die Insel der Seligen*. Jacob Wassermann, who always seeks unusual types, has written a story of absorbing psychological interest about Kaspar Hauser. The *Spinoza* of Otto Hauser, the critic and translator, challenges comparison with Auerbach's biographical novel, but is rather the work of a historian and philosopher than a novelist.

Time and place have lent a color to a number of stories widely different in character. The interval between the two wars for the unification of Germany and the atmosphere of a small Hessian town provide a semi-historical background for Wilhelm Holzamer's posthumous novel, *Vor Jahr und Tag*. In his sequel to *Jettchen Gebert*, Georg Herrmann effectively employs the milieu and some of the literary and artistic associations of Berlin in the first half of the century and lends to his heroine, now *Henriette Jacoby*, some traits of the famous Charlotte Stieglitz. A book impressively reflecting the religious and social aspects of life in a remote rural community is Clara Viebig's story *Das Kreuz im Venn*. It stands apart from other stories of the soil that have been published this year by touching upon the changes brought about

by industrial enterprises, while Hans von Hofensthal's *Buch vom Jäger Mart*, Jacob Schaffner's *Die Erhöferin* and the posthumous story of a Swiss writer, Maria Schlumpf, *Der Weibermann*, deal with the old problem of preserving intact the farm owned and cultivated by the forefathers. Emil Strauss so admirably relieves the pathos of the problem underlying his story, *Der Engewirt*, by a truly philosophical humor, that it not only conveys a message of supreme importance, but becomes a superb little work of art. Local color lends a charm and the antagonism between the Teutonic and the Slav elements a timely interest to Karl Hans Strabl's story of student life in Prague, *Der Shipkapass*, while the extraordinary success of Rudolf Hans Bartsch with his *Zwölf aus der Steiermark* is mainly due to its note of sincerity and its sane reading of life.

Short stories are not very numerous, but show a remarkable diversity. Some of the best have come from Austrian writers, among them Richard Schaukal and Peter Altenberg. Hermann Bahr's *Stimmen des Bluts* are of serious psychological interest, and of sombre coloring. Felix Salten, on the contrary, shows a lighter touch, although there is a deep undernote of pathos in the book which derives its title from the first story *Die Geliebte Friedrichs des Schönen*. Ludwig Thoma's *Kleinstadtgeschichten* are fair specimens of his irresistible humor and robust realism. Heinz Tovote's book, *Nicht doch*, occasionally strikes a serious theme, but is charmingly graceful in manner.

POETRY. No great striking figure has appeared in the poetical production of the year. In quantity, too, it has fallen behind that of previous years. Owing to his prominent position in the modern school, Otto Julius Bierbaum's *Maultrommel und Flöte* challenged attention, but it lacks the spontaneity and sincerity of genuine inspiration and seems more a product of habit than of inner impulse. Wilhelm Schulz, who has a fine ear for the simple rhymes of the folk song and a remarkable gift of imagery, subordinates the latter in his new book, *Der bunte Kranz*, to the pictures by which he illustrates his verse. Hugo Salus is even more disappointing in *Die Blumenschale*, because he once bade fair to develop into an individuality of rare distinction. Max Dauthendey is still pre-eminently a great colorist, but he has attained a higher sense of poetical values; only the name of his new book suggests his old mannerisms, *In sich versunkene Lieder im Laub*. The ambitious title of Gustav Schüller's book of verse does not fulfill the promise of its programme, *Auf den Strömen der Welt zu den Meeren Gottes*, yet is full of a spiritual earnestness which commands respect. Some of the new poetry shows a critical attitude towards the conventions of the modern world. Fritz Adler's *Vom goldenen Kragen* is mainly directed against bureaucracy and militarism, while Hans W. Fischer's *Buch des Widerspruchs* fairly bristles with satire all around. A posthumous volume by Wilhelm Busch, *Herrnack*, had a pathetic interest, since the great humorist is not likely soon to find a worthy successor. Some valuable anthologies have appeared: *Deutsche Lyrik der Neuzeit*, a catholic collection comprising specimens of verse by Ferdinand von Saar, Felix Dahn, Johannes Trojan, Martin Greif, Ernst von Wildenbruch, Gustav Falke, Detlev von Liliencron, Arno Holz, Richard Dehmel, and Otto

Julius Bierbaum. Hanz Benzmann's *Moderne deutsche Lyrik* has been reissued in a revised and enlarged edition.

MISCELLANEOUS. There have been many prose volumes on a great variety of subjects, but none more delightful as a work of art than Gerhart Hauptmann's book of travel, *Griechischer Frühling*, the record of a journey in Greece by a poet for whom every foot of the classic soil bore a mine of associations and suggestions. The fascinating personality of Ernst von Wolzogen is admirably reflected in his essays, *Augurenbriefe* und *Ansichten und Aussichten*, which cover philosophy, letters, music and art. Criticism has lost its strongest representative in Leo Berg, whose *Heine, Nietzsche, Ibsen* was the most recent of his valuable contributions to the history of modern literature. Hans von Wolzogen's book *Aus Richard Wagner's Geisteswelt* is of literary interest, containing minor writings of the poet-composer, among them a study of Faust. Of philosophical works appealing to the general reader by their literary quality the first rank must be accorded to Nietzsche's *Ecce Homo*. His rival as a spiritual force in modern Germany, Gustav Theodor Fechner, has been brought forward in a selection from his writings. Alexander von Gleichen-Russwurm has written a suggestive book *Siegder ruende Aesthetik des praktischen Lebens*, and the latest work by Dr. Rudolf Fucken, the winner of the Nobel prize, *Sinn und Wert des Lebens*, is of absorbing interest.

HISTORIES OF LITERATURE have been scarce. A second revised edition of Carl Weitbrecht's *Deutsche Literaturgeschichte des 19. Jahrhunderts*, a separate edition of that part of Eduard Engel's *Geschichte der deutschen Literatur* which covers the present time, and the second volume of Alfred Biese's *Deutsche Literaturgeschichte*, covering the period from Goethe to Möricke, are among the important publications. Robert F. Arnold, Julius Bab, and Joeza Savits have contributed to the history and criticism of the drama. A valuable work of reference bears the title *Deutsche Literaturdenkmale des 17 und 18. Jahrhunderts*. The volume, edited by Paul Legband, contains specimens of lyric poetry.

BIOGRAPHY. In biography Goethe and Schiller head the list. Bielschowsky's *Goethe* has reached the 56,000 mark. Karl Berger's *Schiller* 14,000, and Eugen Kùhuemann's *Schiller* 9,000. The most important additions to Goethe literature are Ludwig Geiger's intimate study of Goethe's family, *Goethe und die Seinen*, and a book about his ancestors, *Goethe's Ahnen*, by Dr. Carl Knetach. The conversations with Eckermann have been reprinted from the original edition and his diaries have been re-edited by Hans Gerhard Gräff. His correspondence with Marianne von Willemer is another interesting volume. The letters of Schiller and his wife have been edited by Alexander von Gleichen-Russwurm. Other biographical works are Adolf Bartels' life of Jeremias Gotthelf, the Swiss writer, Rudolf Kraus, life of Eduard Möricke, the Suabian poet. Anton Schlosser's life of Anastasius Grün, Count Auersperg, and Ludwig Schroeder's *Freiligrath*, all originally introductions to the author's complete works. Albrecht Keller has edited Franz Grillparzer's autobiography, and a curious undertaking is the autobiography of Friedrich Hebbel, compiled from his diaries, letters, and poems by Hans Brandenburg, and entitled with

reference to Hebbel's struggles, *Der heilige Krieg*.

MEMOIRS. There have been many books of memoirs, foremost among them Henrik Steffens' *Lebenserinnerungen*, essential for the understanding of the romantic school, Richard von Hornstein's *Memoiren*, full of interesting recollections of Schopenhauer and the great writers and musicians of his time and the memoirs of the Baroness Suttner, the champion of the peace movement. But the work which has caused the widest discussion has been Carl Albrecht Bernoulli's *Franz Overbeck und Friedrich Nietzsche*, for its indiscretions called forth a legal injunction and necessitated the publication of Nietzsche's letters to his mother and sister, which otherwise would have been withheld from the public.

NEW EDITIONS have been numerous. Foremost among them is the complete Goethe, edited by Dr. Karl Heinemann with the coöperation of Harnack, Maync, and other scholars. Valuable selections are *Goethe's Sprüche in Reimen* edited by Max Hecker and a truly monumental work is Hans Gerhard Gräff's *Goethe über seine Dichtungen*, of which the sixth volume, covering his opinion of his dramas, has been published. *Unser Nibelungenlied* is the title of a new translation of the epic by Dr. H. Kamp. Authors presented either in new selections or editions of their complete works are Jeremias Gotthelf, Otto Ludwig, Ernst Moritz Arndt, Heinrich Laube, and Christian Friedrich Grabbe. Of historical value is the reprint of Johannes Scherr's *Blücher und seine Zeit*. Among the foreign authors presented in translations are Dante, Cervantes, LeSage, Balzac, Flaubert, Stendhal, Baudelaire, Rambaud, Richardson, Thackeray, Shaw, Wilde, Robert Hunter, Helen Keller, and others.

GERMAN METHODIST CHURCH. See EVANGELICAL ASSOCIATION.

GERMAN NEW GUINEA, OR KAISER WILHELM LAND. A protectorate in the northeast of the island of New Guinea. Area, 70,100 square miles; population, 110,000. In 1907 there were 207 foreign colored, mostly Chinese, and 182 whites (162 Germans). Gold has been found in the Bismarck Mountains. The forests contain areca and sago palms, bamboos, ebony, and other woods. There are cocoa-palms and rubber plantations. Copra is the principal export. In 1906 the imports amounted to 917,000 marks, and the exports to 49,000 marks. The seat of government is Herbertshöhe, in New Pomeranian, Bismarck Archipelago. The budget for 1908-9 balanced at 1,523,469 marks, of which 1,141,569 marks was an Imperial subvention. Attached to German New Guinea are the Bismarck Archipelago (q. v.), the German Solomon Islands (q. v.), the Caroline Islands (q. v.), the Ladrone Islands (q. v.), and the Marshall Islands (q. v.).

GERMAN REFORMED CHURCH. See REFORMED CHURCH IN THE UNITED STATES (GERMAN).

GERMAN SAMOA. This includes the islands of Savaii, 660 square miles and 12,816 inhabitants in 1906; Upolu, 340 square miles and about 18,000 inhabitants; and adjacent smaller islands. Total area, 999 square miles; total population (1906), 34,062. Chinese numbered 1,104, and foreign colored, 855. The whites in

1907 numbered 455 (248 Germans). There are about 8000 pupils in the mission schools. In the past seven years 1,000,000 cocoanut trees have been planted by the Germans, and it is estimated that by 1915 there will be produced 30,000,000 pounds of copra annually. Cacao and rubber are also established industries. The imports are chiefly from Australia. In 1906 the imports amounted to 2,889,000 marks (750,000 from Germany), and the exports, 3,026,000 marks (1,505,000 to Germany). The white planters were formerly dependent upon native labor, but now imported Chinese do the major part of the work. A Chinese laborer receives \$2.86 a month. The total cost to the employer, including passage money, wages, maintenance, and medical treatment, is from \$8.93 to \$11.90 a month. The administration is by a Governor, under whom there are a native High Chief with a native council for the administration of native affairs, and minor chiefs for the administration of districts. The budget for 1908-9 balanced at 704,582 marks, of which 144,482 marks was an Imperial subvention.

GERMAN SOLOMON ISLANDS. This group includes the islands of Bougainville and Buka, to the east of the Bismarck Archipelago. Area, 4200 square miles; population, 45,000. Sandalwood and tortoise shells are the principal exports. For administrative purposes the islands are attached to German New Guinea (q. v.).

GERMAN SOUTHWEST AFRICA. A German colony, between Portuguese West Africa and British South Africa. Area, 317,950 square miles; population, about 200,000. The number of whites in 1907 was 7,110. At Windhoek, the capital, a natural history museum has been started. Settlers receive tracts of land from 2,500 to 10,000 hectares. The chief industry is pastoral. In 1907 there were 101,595 sheep, 3,690 angora goats, 99,663 other goats, 3,119 horses, 5,450 mules, 2,155 asses, 1,202 pigs, and 487 camels. Vegetables and fruits are cultivated. There are Government experimental stations for agriculture, gardening and forestry. The culture of cotton, silk, tobacco, and wine is being introduced. In June, 1908, a diamond field was discovered in the neighborhood of Lüderitz Bay. By the end of August, 1908, 2,000 stones had been collected, mostly weighing two-thirds of a carat. A company has been formed for working it. By a decree of October 1, 1908, this company was granted complete control over the prospecting and working of minerals, except as against the established rights of third parties, in the district bounded on the north by 28° S. lat., on the south by the north bank of the Orange River, on the west by the Atlantic, and on the east by a line running parallel to the sea coast at a distance of 100 kilometres (62 miles) from it. Copper mining is carried on at Tsumeb. In 1907 tin was reported to have been discovered near Lüderitz Bay. The imports in 1906 amounted to 68,626,000 marks (51,837,000 from Germany), and the exports, 383,000 marks (266,000 to Germany). Imports on private account amounted to 36,949,000 marks, the rest being government stores. In 1907 the imports and exports amounted to 32,696,000 and 1,616,000 marks, respectively. The sale of methylated spirits to natives was prohibited in 1908. At the end of 1907 there were 777 miles of railway, and about 1,250 miles of telegraph line. In 1908 the line

from Lüderitz Bay to Ketmanshoop was opened. In 1908 the military force numbered 4,016 (1,020 natives). The budget for 1908-9 balanced at 51,354,558 marks, of which 38,066,472 was an Imperial subvention. The Hottentots renewed hostilities at the end of the year.

GERMANY. An empire of western Europe. Area, 208,830 square miles; population (Dec. 1, 1905), 60,641,278. At the middle of 1908 the population was estimated at 63,017,000. In 1906 there were 498,990 marriages, 2,022,477 births (exclusive of 62,202 still births) and 1,112,202 deaths. The rate per 1,000 of population was: Marriages, 8.16; births (including still births), 34.08; deaths (including still births), 19.20; excess of births over deaths, 14.88. For the quinquennium 1902-1906 the average birth-rate was 34.83; death rate, 20.44: rate of excess of births over deaths, 14.39. The number of illegitimate births in 1906 was 177,060—8.49 per cent. of all births. The number of suicides in 1906 was 9,573 (2,922 females)—20.4 per 100,000 of population. The number of emigrants in 1907 was 31,696 (30,431 to the United States). The principal cities with their populations in 1905 were: Berlin, the capital of the empire, 2,040,148; Hamburg, 802,793; Munich, 538,983; Dresden, 516,996; Leipzig, 503,672; Breslau, 470,904.

EDUCATION. Of 264,321 army and navy recruits in 1907, only 58 were without school education. The number of public schools in 1906 was 60,584, with 166,597 teachers (29,384 female), and 9,737,262 pupils. The total expenditure on public schools was 523,940,000 marks (1 mark=23.8 cents), to which the various States contributed 151,213,000 marks. In addition there were 614 private schools following the same curriculum as the public schools, with 42,094 pupils. Thus the total number of schools was 61,198; of pupils, 9,779,356. The total number of children of school age (6-14 years) on Dec. 1, 1905, was 10,500,000; thus 94 per cent. of all children of school age were in public schools and their equivalents. Of the 6,164,398 school children of Prussia in 1906, 671,845 were Polish-speaking, and 142,769 spoke Polish and German. There are 9 technical schools ranking with the universities. Of the latter there are 21, with 46,741 students in the winter of 1907-8.

AGRICULTURE, FORESTS, AND FISHERIES. The harvested areas and production of the principal crops in 1907 were as follows:

	Hectares.	Metric tons.
Wheat	1,746,787	3,479,324
Winter spelt	305,841	438,000
Rye	6,042,580	9,757,859
Summer barley	1,701,707	3,497,745
Oats	4,377,115	9,149,123
Potatoes	3,297,483	45,538,299
Clover, etc.	1,970,377	9,098,368
Lucerne	234,465	1,401,368
Meadows	5,902,999	*24,911,988

* Of hay.

Vineyards covered in 1907 118,581 hectares, yielding 2,491,894 hectolitres (1 hectolitre =26.4 U. S. gallons) of wine, valued at 114,600,000 marks. Tobacco covered 15,405 hectares, yielding 28,839,814 kilograms of tobacco, valued at 27,012,977 marks. Hops covered 35,856 hectares, yielding 26,340 metric tons. The area under sugar-beet in 1907-8 was 1,112,043

acres; in 1908-9, 1,074,622 acres. The production of sugar-beet in 1907-8 was 13,482,750 tons; in 1908-9, 11,719,931 tons. The forest area of the empire is 13,995,869 hectares. The Prussian State forests covered in 1907 2,639,267 hectares; the average annual net income from them is 92,000,000 marks. The product of the fisheries in the North and Baltic seas in 1907 was valued at 34,233,749 marks. In December, 1907, there were in Prussia 3,041,805 horses, 11,996,804 cattle, 5,398,460 sheep, 15,070,311 pigs, 2,215,558 goats, 46,685,572 head of poultry, 1,528,103 beehives, 6,385 asses, and 395 mules.

MINING AND METALS. In 1907 there were 313 coal mines in operation, employing on an average 545,330 laborers, and turning out 143,185,700 metric tons of coal, valued at 1,394,271,000 marks. The average product per laborer was 263 tons, and the average price per ton was 9.74 marks. Included in the total were 25 State mines, employing 83,307 laborers, and turning out 19,259,000 tons, valued at 218,114,000 marks; giving an average product of 231 tons per laborer, and an average price of 11.33 marks. Notwithstanding the increased production over 1906, when 137,117,900 tons of coal were produced, the demand was so great that 13,721,549 tons of coal were imported, against 9,253,711 tons in 1906—an increase of 48.3 per cent. The export of coal also increased, but to a much smaller extent. In 1907 there were exported 20,056,503 tons, against 19,550,964 tons—an increase of 2.6 per cent. The number of brown coal mines in 1907 was 536; average number of laborers, 66,462; total output, 62,546,700 tons; total value, 156,347,000 marks; average production per laborer, 941 tons; average price per ton, 2.50 marks.

The production of iron ore in 1907 was 27,697,128 tons, valued at 119,186,000 marks, against 26,734,570 tons, valued at 102,578,000 marks, in 1906. The iron market showed no indications of decline until the last three months of the year. The imports of iron ore increased from 7,629,730 tons in 1906 to 8,476,076 tons in 1907 (3,603,500 tons from Sweden, 2,149,299 tons from Spain). Since 1903 Germany has been the second pig iron producer in the world. The pig iron production of 1907 was 12,875,150 tons, valued at 824,077,000 marks, against 12,292,819 tons, valued at 715,188,000 marks, in 1906. The German Iron and Steel Union gave the 1908 iron production as 11,813,511 metric tons, as compared with 13,045,760 in 1907, a decrease of 9.4 per cent. The number of furnaces was 303 in 1907, against 288 in 1906. The imports of pig iron in 1907 were 607,729 tons; exports, 395,376 tons. The total production of cast iron, wrought iron, and steel in 1907 was 14,686,282 tons, valued at 2,183,051,000 marks, against 12,682,929 tons, and 1,948,576 marks in 1906. Included in the production of 1907 were 9,394,100 tons of finished products, valued at 1,952,000,000 marks, against 8,916,859 tons and 1,754,000,000 marks in 1906. The imports of iron and steel and their manufactures in 1907 were 813,345 tons, valued at 120,052,000 marks, against 690,815 tons and 100,169,000 marks in 1906. The exports of these in 1907 were 3,455,889 tons, valued at 791,172,000 marks, against 3,674,634 tons, and 719,745,000 marks in 1906. During the first nine months of 1908 German exports of iron and its manufactures were reported to be 2,804,679

tons, exceeding those for the same period of 1907 by 9 per cent. Of the total, 307,523 tons were pig iron, 323,721 tons partly finished iron and steel, and the remainder wholly finished iron or steel wares. In the same nine months Germany imported 429,905 tons of iron and iron products, a reduction of 28 per cent. compared with the imports for the same period of 1907.

The output and value of other leading minerals in 1907 were as follows: Asphalt, 126,649 metric tons and 1,087,000 marks; petroleum, 106,379 tons, 7,056,000 marks; rock salt, 1,285,138 tons, 5,989 marks; cainite, 2,624,412 tons, 36,117,000 marks; other potassium salts, 3,124,956 tons, 30,527,000 marks; zinc ore, 698,425 tons, 42,293,000 marks; lead ore, 147,272 tons, 20,132,000 marks; copper ore, 771,227 tons, 26,702,000 marks; common salt, 665,547 tons, 16,481,000 marks; chloride of potassium, 473,138 tons, 53,108,000 marks; sulphur ore, 196,320 tons, 1,722,000 marks.

The production and value of the other leading metals and other smelting products in 1907 were as follows: Zinc, 208,195 tons, 96,573,000 marks; lead, 142,271 tons, 54,479,000 marks; copper, 31,946 tons, 61,497,000 marks; silver, 386,933 kilograms, 34,655,000 marks; gold, 4,682 kilograms, 13,071,000 marks; sulphuric acid and of vitriol, exclusive of copper vitriol, 1,402,398 tons, 40,207,000 marks. The lead production declined from 150,741 tons in 1906, but the average price per ton rose from 338.30 marks in 1906 to 382.92 marks in 1907. The copper production declined 329 tons; the imports of raw copper declined from 126,071 tons to 124,117 tons; the export of copper was 6,113 tons, a decline of 1,128 tons from 1906. There are no gold ores in Germany, the gold produced being obtained as a by-product, chiefly from imported ores. Silver is produced chiefly in Prussia and Saxony from State-owned mines. Owing to the depreciation in the value of silver, the Saxon silver mines are being worked at a loss, but the government has shrunk from closing them and exposing the mining population of Freiberg to general misery. But operations are being gradually restricted, and on April 28, 1908, the Saxon minister of finance announced that the mines would be completely closed in 1913. Many of the older miners will be pensioned, and efforts will be made to lessen the evil effects. The famous mining academy at Freiberg will be continued. Reports for 1908 give the coal production at 148,621,201 metric tons; lignite, 66,450,144; coke, 21,174,956 (1907, 21,938,038); coal briquettes, 3,995,449; lignite briquettes, 14,227,218 tons.

MANUFACTURES. During the year ending Aug. 31, 1908, there were in operation 9,882,505 spinning spindles, of which 9,191,900 were running short time. The mill consumption of cotton during the year was 1,793,180 bales (1,247,468 American, 407,950 East Indian, 100,703 Egyptian). The imports of cotton in 1907 were 536,823 metric tons, of which 79,678 were re-exported. This exceeded the imports in 1906 by 89,378 tons. The imports of cotton yarn also increased from 22,284 tons in 1906 to 40,100 tons in 1907. In the latter year the cotton spinners were short of operatives and could not supply the increased demand. The cotton-weaving factories did not work as profitably as the spinners, particularly in the second half-year. Nevertheless, the export of German woven

cotton goods in 1907 was 56,618 tons, an increase of 763 tons over 1906. In 1908 the conditions became more unfavorable, and the import of textile raw materials during the first seven months of 1908 fell to 533,972 tons, against 610,506 tons during the same period in 1907. Cotton fell from 305,977 to 256,675 tons; wool, from 135,017 to 114,651 tons; silk, from 3,422 to 3,017; jute, from 94,628 to 91,055; flax, from 29,451 to 21,037; hemp, tow, ramie, etc., from 42,011 to 47,538 tons. The importation of cotton yarn during the same period likewise fell from 20,268 tons in 1907 to 17,682 in 1908, and woolen yarn, from 15,076 to 11,984 tons. The ratio of operatives seeking employment to 100 vacant places in textile mills was 156 in July, 1908; 121.1 in January, 1908; 92.4 in July, 1907; and 90.6 in 1906.

In 1907 the manufacture of silk and plush goods was carried on in 3,564 establishments, of which 1,313 were cottage or domestic industries not employing any hired labor. The total number of operatives was 71,986, and the average earnings for the year were 901 marks. Crefeld is the centre of this industry, the value of its output in 1907 being \$21,500,000.

At the end of 1907 there were 8,618 chemical factories, with 207,000 operatives, whose wages amounted to \$54,740,000 during the year; the corresponding figures for the preceding year were 8,505; 195,000; and \$49,266,000. The joint-stock undertakings in 1907 numbered 166, with a total share capital of \$125,806,800, reserves \$41,316,800, and outstanding debts \$22,514,800. The dividends paid during the year amounted to \$19,444,600. The average rate of profit in 1907 for the entire industry was 10.73 per cent., an increase of 0.7 per cent. over the rate for 1906. In 1908 the chemical industry, with the exception of the manufacture of white lead and other lead pigments, did not suffer seriously from the general business depression. During the first six months of 1908 the imports of chemical products, colors, and pharmaceutical preparations amounted to 792,776 tons, against 800,423 in the same period in 1907; the exports were 1,170,714 tons, against 1,143,376 tons in the same period in 1907.

The same phenomenon of a decrease in imports and an increase in exports in 1908 was reported from the machine industry. During the first seven months of 1908 the export of locomotives was 27,160 tons, against 16,992 tons for the same period in 1907; steam engines, 28,851 tons, against 20,832 in 1907; agricultural machines, 11,915 tons, against 10,642 tons in 1907; and so on in mining, industrial and other machinery. Prices were reduced in order to meet British and American competition. As to employment, there were 307 applications to every 100 vacancies.

The number of automobile factories in 1906 was 34, with 10,347 employees, and an output valued at \$12,200,000. In 1901 the corresponding figures were 12; 1,589; and \$1,340,000. The average wages increased from \$272 in 1901 to \$307 in 1906.

Including war and trading, ocean and river, steam and sailing vessels, there were being built on private shipyards in Germany during 1907, 1,424 ships of 784,627 gross registered tons, against 1,182 ships of 786,679 tons in 1906. The number of vessels completed in 1907 was 951, of 368,440 gross registered tons, against 757, of 390,991 tons, in 1906. Under

construction in 1907 for foreign account were 141 vessels of 32,702 tons, of which 112 vessels, of 20,102 tons, were completed. At the same time there were under construction on foreign shipyards for German account, 212 vessels of 200,928 tons, of which were completed 145 vessels, of 119,518 tons. The shipbuilding on hand on Sept. 30, 1908, exclusive of war vessels, was 160,804 gross tons, against 236,348 on the same date in 1907. The tonnage of vessels launched in 1908 of 100 tons gross and upwards was reported as 207,777, exclusive of warships, and about 18,000 tons built in the upper rivers.

The product of the porcelain factories in 1907 was estimated at nearly 200,000 metric tons, against 80,000 tons in 1897. The export in 1907 was valued at 71,200,000 marks, against 32,100,000 marks in 1897. During the first six months of 1908 the porcelain exports were valued at 31,790,000 marks, against 34,110,000 marks during the same period in 1907. Prices remained relatively stable.

In 1908 there were 374 glass works with 62,159 employees (7,577 minors and 5,267 women). Prussia alone had 220 glass works with 38,479 employees.

The production of sugar in 1907-8 (Sept. 1, 1907-Aug. 31, 1908) was as follows: Raw sugar, 1,842,092 metric tons; refined, 1,566,895 tons; total output in terms of raw sugar, 2,135,979 tons. The quantity of raw beet used was 13,491,424 tons. The estimate for 1908-9 was 2,050,000 tons. The manufacture of chocolate employs 22,000 skilled workers. In 1907 there was reported to be a shrinkage of over 15,000,000 marks in the value of the output.

The number of breweries in operation in the Beer Excise Territory in 1907 was 5,528, against 5,785 in 1906. The output in 1907 was 46,094,677 hectolitres (1 hectolitre = 26.4 gallons), against 45,866,798 in 1906. The beer excise revenue in 1907 was 66,008,563 marks.

The production of alcohol in 1906-7 (Oct. 1, 1906-Sept. 30, 1907) was 3,841,207 hectolitres in 65,405 distilleries, against 4,376,695 hectolitres in 1905-6. The reduction in production is ascribed partly to the poor potato crop of 1906, but chiefly to the action of the "Centrale," or Spirits Trust, in proposing to its distilleries a reduced production in order to prevent a fall in prices, when it found that on Sept. 30, 1906, there were 772,549 hectolitres of alcohol on hand. The alcohol excise revenue in 1906-7 was 140,917,766 marks. The imports of alcohol in 1906-7 were 29,478 hectolitres; the exports, 231,396; and the consumption, 2,457,405, or 4 hectolitres per capita. The materials used in the manufacture of alcohol in 1906-7 were potatoes, 2,727,493 tons; grains, 403,673 tons; besides molasses, beets, fruit, etc.

The number of juvenile laborers (under 16 years) in Germany in 1907 was 449,236; of female laborers, 1,145,535, of whom 449,436 were between 16 and 21 years of age.

JOINT-STOCK COMPANIES AND TRUSTS. On Dec. 31, 1907, there were 5,147 joint-stock companies, with a nominal capital of 14,218,329,000 marks, against 5,060 companies, with 13,848,610,000 marks of capital, at the end of 1906. The number of cartels, or trusts, was reported to have largely increased during 1907. The chief purpose of these associations of producers is to regulate prices, and hence production.

FOREIGN COMMERCE. The imports for consumption and exports of domestic produce of

the German Customs Union in 1907 amounted to 9,003,323,000 and 7,100,583,000 marks, respectively, against 8,438,554,000 and 6,478,608,000 in 1906. The imports and exports of precious metals in 1907 (included in the above totals) were 256,645,000 and 249,693,000 marks, respectively. The general classification of the imports and exports of merchandise in 1907 was as follows, in millions of marks:

	Imports	Exports
Articles of food.....	2,202.7	530.5
Living animals.....	226.8	11.6
Raw materials.....	4,434.9	1,499.7
Manufactures.....	1,882.3	4,808.9
Total merchandise.....	8,746.7	6,850.9

The principal imports in 1907 were, in millions of marks: Cereals, 945.6; cotton, 571.4; wool, 487.2; hides and skins, 368.6; coal, 343.3; wood and timber, 286.8; chemicals and drugs, 281.4; copper, 245.0; iron, 194.6; silk, 194.1; coffee, 162.4; eggs, 149.7; bran, 148.9; cotton yarn, 140.1; woolen yarn, 139.0; leaf tobacco, 132.0; rubber and gutta-percha, 114.3; linseed, 97.9; fats, 94.3; oil-cake, 94.3; iron manufactures, 87.5; fish, 86.9; machinery, 83.2; hemp and flax, 82.7; butter, 80.6; petroleum, 80.4; coconuts and copra, 78.8; silk goods, 78.8; fruits, 72.2; jute, 66.4. The leading exports in 1907 were: Iron manufactures, 771.5; cotton goods, 432.0; coal, 395.2; machinery, 387.3; chemicals and drugs, 335.3; woolen goods, 285.5; dyes and colors, 236.5; silk goods, 202.5; sugar, 194.9; paper, 190.0; electrotechnical products, 167.3; leather, 152.0; gold and silver articles, 129.2; cereals, 126.6; apparel, 122.7; wool, 122.1; ships, 119.0; copper manufactures, 117.9; glass ware, 115.3; hides and skins, 110.1; peltries, 106.5; pottery, 106.3; cotton, 83.6; leather manufactures, 81.7; jewelry, 80.3; wool yarn, 75.3; musical instruments, 64.6; books and maps, 58.9. The distribution of the commerce in 1907 among the principal countries of origin and destination was as follows, in millions of marks:

From and to	Imports	Exports
Great Britain.....	976.6	1,060.4
Netherlands.....	227.5	452.1
Belgium.....	296.7	342.9
France.....	453.6	449.1
Switzerland.....	210.8	446.4
Austria-Hungary.....	812.3	716.6
Denmark.....	123.0	207.1
Sweden.....	172.0	186.6
Russia.....	1,069.9	483.3
Rumania.....	149.8	68.6
Italy.....	285.4	302.9
Spain.....	139.9	65.6
Turkey.....	55.1	81.5
British India.....	407.1	104.7
Dutch India.....	187.1	42.6
China.....	56.7	63.2
Japan.....	29.4	102.4
Egypt.....	80.4	39.5
United States.....	1,319.3	652.3
Mexico.....	21.6	58.7
Brazil.....	196.0	104.1
Argentina.....	442.5	179.2
Chile.....	143.9	84.7
British Australasia.....	228.0	61.1
German Colonies.....	22.2	36.8

NAVIGATION AND SHIPPING. The total net tonnage entered at German ports in 1908 was

25,602,488, and cleared, 25,619,159. The Baltic ports were entered and cleared by 15,706,736 tons; the North Sea ports, by 35,595,433 tons. German shipping constituted 49.64 per cent. of the tonnage entered and cleared; British, 26.70; Danish, 8.23; Swedish, 5.87; Norwegian, 4.08; Dutch, 1.99; Russian, 1.28. The merchant marine on Jan. 1, 1908, consisted of 4,571 vessels, of 4,282,720 gross tons and 2,790,435 net tons (including 625 fishing vessels, of 71,492 gross and 31,989 net tons). Sailing vessels numbered 2,649, of 533,652 net registered tons, and steamers 1,922, of 2,256,783 net tons. The crews numbered 71,853. Hamburg, the foremost maritime State, had 1,291 vessels, of 1,531,443 tons, including 697 steamers, of 1,255,463 tons.

INTERNAL COMMUNICATIONS. The length of railways in the empire on Aug. 1, 1908, was 36,286 miles, of which 3,209 miles were owned by companies, and the rest by the States. The ownership by States was as follows: Prussia and Hesse, 24,175; Bavaria, 4,084; Saxony, 2,027; Württemberg, 1,217; Baden, 1,078; Mecklenburg, 679; Oldenburg, 398; Alsace-Lorraine, 1,223. The total length of telegraph line in 1907 was 93,963 miles, of which 12,228 miles were owned by Bavaria, 4,673 miles by Württemberg, and the rest by the Empire. A two-cent letter postage was arranged between Germany and the United States, to come into effect on Jan. 1, 1909, and to apply only to letters carried by direct mail steamships between the two countries. The number of automobiles in the empire on Jan. 1, 1908, was 36,022, against 26,026 the previous year.

The Government railways of Westphalia and the Rhine Province were no longer able to cope with the ever-increasing traffic of the industrial and mining centres of the region. The government therefore began in the spring of 1908 the construction of the Rhine-Herne Canal, which is to join the Rhine with the Dortmund-Ems Canal and traverse the entire coal-field and industrial region of Westphalia. The bed of the river Emscher will be utilized to a great extent. The canal will join the Rhine at Ruhrort, and will have branch canals to Essen, Bochum, and Gelsenkirchen. It is to be finished by 1915 at the latest. The navigation on the Kaiser Wilhelm Canal in 1907-8 was 34,998 ships, of 6,423,441 net tons.

ECONOMIC CRISIS. The recent commercial boom came to a definite end towards the latter part of 1907. The finishing industries were the first to suffer, for the reason that higher wages and higher cost of raw materials bear more directly on them, and also because they are rarely able to combine to prevent underbidding or command terms to the syndicated industries on which they depend for the supply of raw materials. But with the progress of the crisis, the building trades, the iron and steel industry, shipbuilding, the textile industry, etc., also succumbed. At the beginning of the depression there was a general tendency to ascribe the slackening of trade to the high rate of interest. The latter was accounted for partly by special occurrences, such as the destruction of capital in the Russo-Japanese War and the San Francisco and Valparaiso earthquakes; partly by the withdrawal of foreign capital from German enterprises, the sudden calling by the United States for the settlement of German accounts, the absorption of German capital in foreign enterprises, such as colonial banks, electrical in-

stallations, the Rumanian petroleum industry, etc.; and partly by the increased expenditure of State and cities for social betterment purposes, the "increasing luxury of the working classes," etc. But towards the end of 1908 the rate of interest fell lower than it had been in many years, less than half of what it had been a year before, and still there was no sign and no expectation of immediate improvement. It was stated that the firm grip of the syndicates on most of the great branches of industry had prevented the depression from issuing in a panic; but it was admitted that this very fact may have resulted in the spreading of the depressed condition over a longer period.

FINANCE. The budget estimates of revenue and expenditure for the fiscal year 1908-9 balanced at 2,784,852,293 marks. The principal estimates of revenue, in marks, were: Customs, 666,974,000; excise taxes common to the whole empire, 401,889,910; various taxes, 189,168,770; posts and telegraphs, 644,147,000; railways, 125,532,000; receipts from the Reichsbank and other banks, 34,669,000; interest on Invalid Fund, 36,852,642; compensatory quotas from the states outside of the Beer Excise Territory (Bavaria, Württemberg, Baden, and Alsace-Lorraine), 19,914,748; contributions from the various States apportioned according to population, 346,028,072 (Prussia, 198,893,383; Bavaria, 32,776,404; Saxony, 23,797,012; Württemberg, 11,807,076; Baden, 10,615,752; Alsace-Lorraine, 9,578,895, etc.); extraordinary revenue, 265,551,252 (including loans of 260,954,112). The principal estimates of expenditure were: Colonies, 57,804,619; posts and telegraphs, 621,749,783; railway administration, 1,215,167,000; army, 854,392,244; navy, 348,973,677; pensions, 110,382,550; Invalid Fund, 36,039,449; debt of empire, 155,972,024. At the end of 1906 the interest bearing debt of the empire stood at 3,803,500,000 marks, having increased by 260,000,000 in course of the year. The non-interest bearing debt, consisting of treasury bills and paper money, amounted to 510,000,000 marks. The Invalid Fund stood on March 31, 1908, at 178,359,400 marks. The War Fund of 120,000,000 marks is preserved in gold.

For several years past the contracting of new loans had been a regular feature of the German budget, occasioned mainly by the ever-increasing expenditure on army and navy. This, together with the unfavorable international relations of the empire, resulted in lower quotations for German bonds than for French, or even Italian and Spanish bonds bearing the same rate of interest. To do away with the continually recurring necessity for borrowing, Herr Sydow, the finance minister of the empire, laid on Nov. 4, 1908, before the Reichstag a bill authorizing additional taxation, estimated to yield at least 500,000,000 marks annually. A partial monopoly of the manufacture and sale of spirits to be given to the Imperial government was estimated to yield 100,000,000 annually; an additional excise duty on tobacco, 77,000,000; an additional excise duty on beer, 100,000,000; a tax on bottled still wine, 20,000,000; a new inheritance tax, 92,000,000; a tax on electricity, 50,000,000; a tax on advertisements, 33,000,000; and an increase in the matricular contributions of the States, 28,000,000. At the end of 1908 the proposals were in the hands of the Finance Committee of the Reichstag.

ARMY. Military service is compulsory and universal, liability commencing at the age of 17, but actual service usually at the age of 20, and ending at the age of 45 years. The term of service in the First Line, or active Army, is 7 years, of which 2 years is in the ranks and 5 years in the reserve, except for Cavalry and Horse Artillery, which serve 3 years in the ranks and 4 years in the reserve. After service in the First Line, there is 5 years (3 years for Cavalry and Horse Artillery) in the first ban of the Landwehr or the Second Line Army, with two periods of training of 8 to 14 days each. The soldier then passes to the second ban of the Landwehr or reserve of the Second Line Army, with no training until he completes his 39th year. Finally, all soldiers pass to the Landsturm, or Home Defence Army, second ban, until the completion of the 45th year. The first ban of the Landsturm consists of all those between the ages of 17 and 39 years, who have received no military training. The one-year volunteers consists of educated young men who pay all their own expenses, and this class is a very useful one, furnishing all the Reserve and Landwehr officers. The Ersatz Reserve consists of all young men of 20, fit for service, who are not required for the annual contingent of recruits, and this class is held as its name indicates to "compensate" the losses in war. Of the more than 1,000,000 young men examined annually less than one-half are passed as fit for land or sea service; of this number more than one-fourth are sent at once to the Landsturm, that is, are exempted from actual service; and about 80,000 go to the Ersatz Reserve, the annual contingent for the Army being about 210,000 to 220,000 men. There are 216 regiments of Infantry and 18 rifle battalions, 99 regiments of Cavalry, 92 regiments of Field Artillery, 18 regiments of Garrison Artillery, 26 battalions of Field Engineers, 7 battalions (3 1-2 regiments) railway troops, 4 battalions telegraph troops, 1 battalion balloon troops, and other auxiliary organizations, all belonging to the First Line. The peace strength of the active Army was about 619,000 combatants of all ranks; that of the Field Army (23 corps and independent Cavalry) about 1,160,000, including the reserve. To this number must be added the mobile Landwehr of 600,000, which gives an aggregate for the trained Field Army of 1,760,000 men, not including garrison troops or Landsturm. Besides this there is the Ersatz Reserve of about 1,500,000 to supply the losses of war.

The Infantry is armed with the Mauser magazine rifle; the Cavalry with the Mauser Carbine; the Field Artillery is being re-armed with a modern quick-firing shielded gun. The military budget in 1908 carried about \$192,500,000, which is about \$6,000,000 more than for the preceding year.

The principal activities in the German Army in 1908 were the following: Maneuvers in mine laying; experiments with airships and means of attacking them by means of armored automobiles, possessing high speed and carrying rapid-fire guns; development of automobile trains by competition and subsidies to manufacturers of automobiles; experiments with new rifle with long bayonet for Cavalry troops; arming Field Artillery with Carbines; a large increase in machine guns detachments; experiments with automatic rifles, and with trav-

eling kitchens for use in the field; the replacing of the revolver by an automatic pistol, model of 1908; the use of motor cycles at maneuvers, and the preparation of new cavalry drill regulations, and of separate regulations for maneuvers.

NAVY. In 1908 the effective German navy consisted of 24 first-class battleships, aggregating 286,990 tons; 8 armored coast defense vessels, 32,800 tons; 12 armored gunboats, 12,970 tons; 8 armored cruisers, 79,800 tons; 5 protected large cruisers, 31,146 tons; 28 protected large cruisers, 80,983 tons; 11 unprotected small cruisers, 16,800 tons; 9 gunboats, 6,164 tons; 69 destroyers, 20,237 tons; 47 torpedo boats, 7,080 tons. Total, 221 ships, of 584,970 tons, besides 1 submarine, with 54,409 officers and men. The increase in tonnage in 1907 was 32,543. There were also 5 convertible cruisers ranging from 5,400 to 19,300 tons. The number of battleships under construction was 6, of 98,400 tons; armored cruisers 2, of 30,000 tons; besides 6 small cruisers and minor craft. By the navy law of 1900 there were to be constructed by 1918 two double squadrons of a flagship and 8 battleships each; together with the usual complement of cruisers and other vessels, and a reserve squadron of 4 battleships. In 1908 a supplementary law was adopted, reducing the age limit of battleships from 25 to 20 years, in consequence of which 18 battleships will have to be built, both new and in substitution of the obsolete ones, and the number laid down annually increased. By the law of March, 1908, the number of battleships of the *Dreadnought* class (19,000 tons) to be laid down annually for the four years 1908-1911 was raised to 4, and it was also provided that in the six years 1912-1917 the existing protected cruisers shall be replaced by large armored cruisers. Germany during the year was spending enormous sums on the development of Wilhelmshaven as a great naval base, on Heligoland as a fortified harbor for torpedo boats and other small craft, and on the widening of the Kiel Canal to permit its use for the largest of the new battleships.

GOVERNMENT. Emperor Wilhelm II., born Jan. 27, 1859, ascended the throne June 15, 1888. The Chancellor of the Empire in 1908 was Prince von Bülow. The Secretaries of State were as follows: Foreign Affairs, W. von Schoen; Interior, Dr. von Bettmann-Hollweg; Navy, Admiral von Tirpitz; Justice, Dr. A. Nieberding; Exchequer, von Sydow; Colonies, B. Dernburg. Chief of the General Staff, Count von Moltke.

HISTORY.

FINANCIAL DIFFICULTIES. On the assembling of the Reichstag, Baron von Stengel, Secretary of the Treasury, having encountered opposition to the revenue measures which he proposed, resigned and was succeeded by Dr. von Sydow, formerly head of the Imperial Telegraphs and Telephones, who started immediately and energetically at the work of financial reform. It was evident that radical measures of reform were necessary, the deficits having recently increased, and large loans having been required to meet them. Since 1877, when the milliard from France was exhausted, the Empire has followed the policy of meeting deficits by loans, and in every year but one since then there was an addition to the national debt which in 1908 stood at \$1,013,000,000, entailing an annual cost in interest

and in expenses of administration of \$380,000,000. Between 1895 and 1908, the debt doubled, and during the first eight years of the twentieth century the expenditures have been \$471,000,000 in excess of the revenues, or about \$53,000,000 per year. The cause of this has been the enormous expenditure on the army and navy, coupled with the inadequate sources of revenue, which consist mainly of customs duties and internal taxes on various commodities, in other words, of the product of indirect taxation, which varies with the prosperity of the country. Direct taxation having been assumed by the separate states, the Empire could not impose either an income tax or a national property tax. During the five years ending with 1908, national expenses increased by \$93,000,000, of which \$73,000,000 was due to the army and navy; a far greater percentage of increase than in any other nation. According to the government estimates in 1908, new loans and extraordinary expenses would increase the national debt in 1913 by \$238,000,000; of which \$124,000,000 was for carrying out the shipbuilding programme, in addition to the ordinary naval expenditures. The government, however, did not emphasize these obvious army and navy items in accounting for the increase, but referred to the increase of salaries and pensions in the civil service, the arrears of the States in their contributions, the amortization of the public debt, and the loss of revenue from the reduction of the sugar tax and the abolition of the railway tax.

In spite of her pressing needs, Germany has not tapped certain sources of revenue so thoroughly as has been done in other countries, for example, liquors and tobacco. Brandy and alcohol yielded only 67 cents per capita, as against \$2.70 in England; beer, 20 cents, as against \$1.16 in England; tobacco, 32 cents, as against \$1.65 in England; and while England gets \$93,000,000 from the estates of decedents, Germany has had a tax on collateral heirs only since 1906, and this tax has yielded little. On the other hand, certain taxes have been very high. For example, the state and local taxes in many Prussian towns and country districts range as high as 12 to 15 per cent., and the richest taxpayers in many Bavarian cities have paid 15 or 16 per cent. Dr. von Sydow's new tax programme, presented early in November, comprised the following leading features: A partial monopoly by the government of the manufacture and sale of spirits, the government to purchase the products of distilleries, to refine them and sell them to retailers—expected to yield \$24,000,000; an increased excise duty on beer, to yield \$24,000,000; an increased excise duty on tobacco, to yield \$18,000,000; an increased tax on wine, including excise duty on still wine in bottles, to yield \$5,000,000; death duties, to yield \$22,000,000; tax on electricity and gas, to yield \$12,000,000; tax on playcards, posters and newspaper advertisements, to yield \$8,000,000; the remainder to come from assessments on the states by raising the matricular contributions from 40 pfennigs to 80 pfennigs per capita. The total yield from these sources was estimated at about \$120,000,000. Although the fate of these proposals was undecided at the close of the year, it was evident from the vigorous opposition to some of them that success was doubtful. The tax on beer was exceedingly unpopular. As to the death duties, the state was to be re-

garded as the next heir in the settlement of interstate properties, after children, parents, grandparents, brothers, sisters and their descendants. Estates worth less than 20,000 marks were exempt. Beginning with 20,000 marks the tax is one-half per cent., and it reaches a maximum of three per cent. with estates worth \$238,000; whereas in England the tax ranges from 1 to 15 per cent. The measure was opposed by the landed aristocracy on the ground that it offended the feelings of family. The bill permitted the tax on land to be paid in instalments within a period of twenty years. In spite of its moderate character it seemed probable that the conservative element, including the large land-owning classes, would defeat it. The tax on electricity and gas, which affected a vast number of industries, also encountered serious opposition; and the tax on newspaper advertisements was vigorously denounced in the press. The debate on the budget began on Dec. 5, and the Finance Minister's proposals were referred to committee. The year closed amid great uncertainty as to the means of providing the necessary revenue. Prussia also had to face a serious financial problem. Baron Rheindaben announced that in 1907 trade having declined, especially in the iron industries, there was at the close of the year a deficit of \$14,000,000 to \$15,000,000, and that the year 1908 would probably show no better balance. When the Landtag met in October, the speech from the throne declared that nearly \$49,000,000 was needed for the revenue. The tax programme submitted in October involved heavy increases, including the increase of the income tax and the levying of a progressive tax on the profits of trading and industrial companies. In Prussia there was opposition to the government's programme which was submitted on October 20, and on December 5 the progressive taxation of the trading and industrial companies was rejected. The increase of the income tax was modified and limited to two years.

ASSOCIATION LAW. One of the chief events in the Parliamentary record of 1908 was the passage in the Reichstag of the new law concerning associations and public meetings which placed their regulation for the first time on a national basis. Each State of Germany had legislated singly in this matter and there was great diversity in the laws. Even comparatively conservative opinion had, for a long time, demanded the unification of the superannuated and inconsistent laws of the North German States, Prussia, Saxony, Hamburg, Brunswick and Mecklenburg, where the police exercised almost unlimited surveillance, and where women were excluded from taking any part in public meetings or political associations. In the South German States the existing laws are more liberal. The new measure limited the police power of dissolution, and provided that only in case of public meetings should the police be notified. It introduced a more liberal system than that which prevailed in the North German States, especially in Prussia. The main opposition was directed against the language clause. As first presented by the government the bill forbade the use of any foreign language at public meetings, but in this encountered such vigorous opposition that it was obliged to accept a compromise. As amended, the language clause provided that in the dis-

tricts where 60 per cent. of the population habitually spoke a foreign language, it could be employed at public meetings during twenty years. It was required that the police should receive three days' notice. The prohibition of the use of non-German language does not apply to international congresses or to the meetings of electors for the election of members to the Reichstag and of the legislatures of the Federated States and Alsace-Lorraine; it also admits exceptions through the legislation of the separate States, and declares that the central authorities of each German State may, if there are no State laws to the contrary, permit exceptions to the rule. The clause as thus modified was opposed by the Centre, the Socialists, Poles, and some disaffected Liberals, but was carried on April 4th by a small majority, the main part of the law having been carried in the previous month. The argument against it was that it would prevent a large number of Poles and of the residents of Alsace-Lorraine from participation in public affairs. But this was denied, since so many of the Polish districts had a population of more than 60 per cent. speaking the Polish language that the application of the law would be very limited. The language clause applies only to public meetings, not to associations. Though the Association Law as a whole was severely criticised, it was generally regarded as substituting a somewhat more liberal system for the existing one.

BOURSE LAW. One reason for the Liberal support of the Association Law was the fact that certain concessions had been made to them in connection with the law concerning stock exchange operations (the Bourse Law). The Conservative elements, including the Centre, favored stricter measures than at present in regard to stock exchange operations. On the other hand, the present law was, in the opinion of the Liberals, already too stringent. The measure which the Conservatives proposed not only forbade term purchases in grain, but increased the penalties for infractions. The provisions were modified to meet the demands of the Liberals with the results that the restrictions on the Bourses were made less severe in certain respects. One feature of the new law was aimed at making it more difficult for swindling speculators on the stock exchange to secure court sanction of the repudiation of debts incurred in stock transactions.

THE BLOC AND PARTY POLITICS. The bloc in the Imperial Diet was made up of Conservatives, Anti-Semites, National Liberals, and Radicals, a heterogeneous mass, whose members were so discordant that they themselves did not believe the alliance could long endure. It lasted through 1908, however, and by means of it some important legislation was secured, namely, the Association Law and the Bourse Law above mentioned. It was, in effect, the means of self-preservation of its component groups against the rising power of the Social Democrats, but there were signs in 1908 that the Liberals felt that they were required to sacrifice too much to that end. The Liberal support of the bloc after the government's curt refusal to sanction universal suffrage in Prussia, which was sharply criticised throughout the country, led to the withdrawal of a number of advanced Radicals under Dr. Barth. The immediate occasion was the controversy over

the action of the majority in the Reichstag in voting for the language clause of the Association Bill.

At a Congress of the Liberal Union at Frankfort-on-Rhine, at Easter, Dr. Barth and about twenty of the more radical members declared their final separation from the party, contending that the *bloc* had demoralized liberalism which was fast descending into opportunism. The new group desired its freedom to pursue purely liberal ends. It could not accept a policy which sacrificed party principles to the interest of the *bloc*. The Liberal attitude toward the question of Prussian universal suffrage and toward the language clause of the Association Law seemed instances of such sacrifice. The new group wished to represent precisely the democratic tendencies of the bourgeois, aiming at an alignment with the Socialists on the one hand and with the Democratic element in the Centre on the other. This approach toward the Socialists was significant since they were regarded by the Liberals generally as their most deadly foes. The cardinal principle of the new party, however, was that all means must be employed to check reaction in the government, and that Democratic elements, wherever found, must coöperate to that end.

The Socialists welcomed this alliance, and during the elections for the Landtag their sympathies were openly shown, and actual coöperation between the two parties was evident in certain instances. Another important party quarrel arose among the Social Democrats. The deputies of the party in the Landtags of Baden and Bavaria decided, at a General Conference in August, to vote the entire budget without reserve, although they had hitherto refused to do so. Revisionist tendencies have been on the increase in South Germany where the democratic element is stronger in the party than the socialistic. The reasons assigned for the change of attitude toward the budget were that the budget comprises the best means of realizing the social reforms that they desired, and that in the South German States of Bavaria, Württemberg, Baden, and Hesse much progress has been made in the direction of democracy, owing to electoral reform. In these States the Socialists have the same rights as others, while it is not so in North Germany, especially in Prussia. Hence, a different attitude was very desirable. The action of the South German Social Democrats was condemned by the orthodox Marxists who controlled the organization of the party and the Central Committee. See the article SOCIALISM.

NAVAL QUESTIONS. In announcing and explaining the German naval policy, Chancellor von Bülow declared in answer to criticism at home and abroad that the government policy was purely defensive and that Germany desired peace with England and did not dispute the latter's right to a programme which would insure her the supremacy of the sea. In spite of vigorous opposition in the Reichstag, the Navy Bill, calling for the construction by 1917 of 17 battleships, of which 7 were of the large type, and 19 small cruisers, was passed in March. Three battleships and one cruiser of the *Dreadnought* type were to be built each year up to and including 1910; 2 battleships and 1 cruiser in 1911; and thenceforth during

the six years, 6 battleships and 6 cruisers of the heaviest type. It was estimated that the Navy Law would increase the ordinary naval budget to \$95,000,000 by 1917 as compared with \$55,000,000 in 1907, and that the cost of the shipbuilding programme would, in addition, be about \$124,000,000. The German Navy League opened its annual meeting at Danzig on June 14th, and a resolution was passed declaring that the League represented national aims and not a party policy. The dissensions in the League continued and General von Keim declined to stand for reelection. It was declared in the press that the League was no longer necessary, German sentiment having been already won over to the policy of maintaining and increasing the navy. The opinion was also expressed in many quarters that a propagandist of the type of General von Keim was no longer needed.

In July it was announced by General von Keim that 140,000 members had seceded from the organization. The presidential committee of the League, during its session at the end of September, declared that it could not intervene in the dispute between the extreme supporters of General von Keim and his opponents. It was resolved that the government be urged to bring the cruiser squadrons up to date and that the navy be provided at once for the maintenance of the defenses. On Mar. 7, the *Nassau*, the first of the battleships of the *Dreadnought* type, had been launched. The cost was estimated at \$9,100,000; her displacement was 17,960 tons, and her minimum speed, 19 knots. A companion vessel, the *Ersatz Sachsen*, was in process of construction. (See BATTLESHIPS.) The Conservatives were opposed to the naval programme, arguing that such an increase in the navy was not only inconsistent with the former policy of Germany, but was injurious to the army which was in even greater need of increase. In the Conservative press it was declared that all that was necessary was to make sure that German coasts and German ports were secure from attack. The party stood for the interests of the army against the navy, therein opposing the Liberals, who were champions of the navy. Their organ pointed out that though ten years ago German naval expenditure was less than one-third that in England, it was now more than one-half, and that no other power had increased its expenditures so rapidly. At the Pan-German Congress, which opened on Sept. 6, it was declared by the President that any agreement in regard to naval armaments would be a suicidal course for Germany to take. As in 1907, the alarm in England over Germany's increasing naval expenditures showed itself on many occasions. One notable instance occurred early in the year on the announcement in the press that the Kaiser had written a letter to Lord Tweedmouth, which it was alleged marked a design to interfere in the affairs of the British Admiralty. (See GREAT BRITAIN, paragraphs on History.) On the Emperor's side, it was said that although he had written to Lord Tweedmouth, it was a purely personal matter and he had made no attempt to interfere with British policy, but merely to correct certain wrong notions in England as to the German fleet.

FOREIGN AFFAIRS. The main interest in German diplomacy during the year was cen-

tred in the difficulties with France that arose over the Moroccan question (see FRANCE, paragraphs on *History*) and the negotiations arising from the problems in the Balkans (see BALKAN QUESTION). Germany took part in an important arrangement concluded early in the year for the settlement of the status of the powers on the Baltic. On Nov. 2, 1907, a treaty had been signed between Norway and the four great Powers in the North of Europe, Germany, France, Great Britain and Russia, whereby the integrity of Norway was guaranteed. (See NORWAY.) On Apr. 3, 1908, an agreement was signed at St. Petersburg for the maintenance of the *status quo* in the Baltic by Germany, Russia, Sweden, and Denmark, and on the same day a like agreement was signed at Berlin for the Powers on the North Sea by Germany, Great Britain, France, Denmark, the Netherlands, and Sweden. These instruments bound the signatory powers to maintain the *status quo* on the Baltic and North Seas and to preserve the territorial rights of the countries in those regions. If the *status quo* were threatened they agreed to take steps toward joint action in maintaining it. In the Baltic Convention the sovereign rights of Russia were specifically reserved, and both conventions contained an express statement to the effect that nothing in the agreement should be construed as curtailing the sovereign rights of any of the signatory powers to their possessions. The intervention of Germany for the purpose of securing the recognition of Mulai Hafid in Morocco (q. v.) and the subsequent withdrawal of this proposal was criticised both in the German and foreign press as a blunder of diplomacy. Similar criticism was occasioned by the German demand of France that she should tender an apology in the matter of the seizure of the Casablanca deserters, before reference of the dispute to arbitration, and Germany's subsequent withdrawal of that demand. (See FRANCE, paragraphs on *History*.) On the other hand, Chancellor von Bülow warmly defended the German diplomatic policy, and in a speech in December said that when no question had been raised as to the fact that French officers had interfered with the German Consulate, Germany had been obliged to insist that an apology should precede the reference of the affair to arbitration, but when France placed this fact in question, Germany naturally was ready to agree to a simultaneous expression of regret. He declared that it was not a defeat for German diplomacy but a triumph of common sense. He further remarked that too much was made of the matter of prestige and petty diplomatic victories, and that Germany did not need that sort of prestige. See INTERNATIONAL ARBITRATION.

A great deal was said in 1908, as in the previous year, on the subject of "German isolation." In a speech delivered by the Emperor in the summer, there occurred a remark to the effect that if foreign nations were trying, as they seemed to be, to bring Germany to bay, the Germans were ready to meet them and that his people never fought better than when they had to defend themselves on all sides. Relations with England continued to be the object of much attention, and much was said about the attempt to isolate Germany after the meeting of King Edward and the Czar at Reval. There were signs of apprehension, not only in

the press, but even in official quarters, but this was allayed somewhat after the Kaiser and King met at Kronberg and after the conciliatory speeches on the part of British public men. The source of this feeling was indeterminate and could not be attributed to any definite causes. It was remarked on the occasion of the Manœuvres of the British fleet in the North Sea, how little the policy of the two governments was affected by these vague fears, for while the British warships were in the neighborhood of the German coast, the German fleet was manœuvring in the neighborhood of the Canaries, leaving the entire coast line of their own country exposed. The main source of these fears was, of course, the supposed rivalry of the two Powers in shipbuilding.

The Inter-Parliamentary Union was held at Berlin in the middle of September. Chancellor von Bülow made a speech in which he applauded the work and aims of the Congress and the part Germany had played in promoting peace and arbitration. Baron von Plener, former Austrian Minister of Finance, reported on the question of obligatory arbitration and submitted a resolution for a treaty among all the Powers, providing for obligatory arbitration. This was unanimously adopted. The Congress also resolved to invite the Powers to a third Hague Conference, to which the following principles should be submitted for adoption: Contraband of war to consist only of weapons, ammunition, and other necessities of war designed for the use of one of the belligerents; a ship carrying contraband not to be destroyed, or the part of its cargo that is not contraband; private property inviolable; open ports never to be blockaded. The German and British representatives having made it a condition of attendance that the question of reduction or limitation of armaments should be avoided, nothing was said on that subject. The Congress closed on Sept. 13.

Germany's position in the Balkan difficulty was embarrassing, for, on the one hand, she was the friend of Turkey, and, on the other, the ally of Austria. There was much discussion at first as to the alleged jealousy of Germany of the close relations between Great Britain, France, and Russia, and of a tendency to divide Europe into two groups, one centring around those three Powers, and the other around Germany and Austria. M. Isvolsky, the Russian Minister of Foreign Affairs, after visiting France and Great Britain, and discussing the proposal of a conference of the signatory Powers to the treaty of Berlin, visited Germany and conferred with the Emperor and Chancellor von Bülow. Germany at length agreed to the proposals as drafted by Great Britain, France, and Russia, subject to the exclusion of topics which Austria did not wish to have discussed. In the course of an explanation of Germany's Balkan foreign policy, in December, Chancellor von Bülow declared that the German government was not unfriendly to the Turkish movement, but, on the contrary, would be glad to see the new régime strengthened. She must be loyal to Austria, however, and she must therefore leave the initiative in the Balkan Question to other Powers. The question of the Kaiser's personal participation in the foreign affairs of Germany and the trouble arising from the publication of his interview in a British newspaper, are discussed in the following paragraph. In March the Emperor and Em-

press passed a week in Venice on their way to Corfu, where the Emperor had purchased the Villa Achilleion, formerly owned by Empress Elizabeth of Austria. At the same time, Prince von Bülow visited Austria and held a conference with the Austrian Premier. On April 10, the Imperial party reached Corfu and were visited by the Greek Royal family. Early in May the Emperor and Empress, with their suite, were present at the opening of the restored castle of Hochkönigsburg in Alsace-Lorraine. On Aug. 4, they visited the King and Queen of Sweden. On Sept. 11 the Emperor again visited Alsace-Lorraine, and journeyed through the country in a motor car. On Nov. 6 he visited the Emperor Francis Joseph.

THE KAISER'S INTERVIEW. One of the most discussed events of the year was the publication, on October 28th, in the London *Daily Telegraph*, of an interview with the Kaiser on the subject of his attitude and that of the German people toward Great Britain. It appeared that the Kaiser had talked with a number of Englishmen on this subject with great frankness, and that one of them, thinking it would tend to allay British suspicion of Germany, wrote out what had been said to him and others in the form of an interview. He then submitted it to the Kaiser, asking his consent to its publication, and the Kaiser sent it to Chancellor von Bülow for consideration, who, not suspecting that it was an interview with the Kaiser, turned it over to one of his subordinates, who read and reported favorably on its fitness for publication. Thereupon, von Bülow returned it to the Emperor with his approval. It was put forth as a "calculated indiscretion" for the purpose of allaying the hostility of British opinion toward the Kaiser. It declared that while the prevailing sentiment of the middle and lower classes of Germany was anti-English, the Kaiser and the minority, including the best elements in the country, were friendly to England. During the Boer War the attitude of the German people toward Great Britain was, he admitted, bitterly hostile, but not that of official Germany. He pointed to his refusal to receive the Boer delegates, though other European States had received them, and his declining to take part in any concerted action to put pressure on England for the ending of the war; also to his sympathetic reply to the Queen during the week of disasters in December, 1899, and to his working out of a plan of campaign and sending it to England after it had been submitted to his general staff for criticism, and he added that the actual plan of campaign followed very nearly the same lines. He dwelt on the importance of a powerful fleet for the protection of German commerce, and particularly as a safeguard in case of trouble in the Far East, adding that if China and Japan increased in power, only great naval powers would be treated with respect, and that Great Britain herself might welcome a strong German fleet. His interviewer, having said that there had been general complaint because the German Minister, Dr. Vassel, had returned from Tangier to Fez, the Kaiser said that the German subjects in Fez were asking for aid and protection, and he wished to know whether his critics were aware that a French representative had been in Fez several months before Dr. Vassel was sent out. The publication of this remarkable interview immediately aroused the severest criti-

cism, not only in foreign countries, but in the German press, and even in quarters that hitherto had been very loyal to the Kaiser. In France, England, and Russia, the press pointed to many inconsistencies between the statements in it and what had actually occurred at the time. In France it was said that the Emperor must have been misinformed as to the Fez affair, since after the Foreign Consul left Fez, there had been no French representative there, and that there was not even now. In Russia it was warmly denied that there had been unfriendliness to England during the Boer War, and it was said, on the other hand, that Germany had done her best to instigate Russian hostilities, and that, in fact, the Kaiser was one of the inciters of the Boers. More important, however, was the effect of the publication in Germany.

CRITICISMS OF THE EMPEROR. On reading the interview in the newspaper, Chancellor von Bülow informed the Emperor that he had not read the draft, but regarded himself as responsible, and tendered his resignation. This, however, the Emperor refused to accept. An important debate began in the Reichstag on Nov. 11, before a crowded house, in which were present all the Ministers and all the members of the Federal Council. The frank and fearless criticism of the Kaiser that followed was without precedent in German parliamentary history. There was a nearly unanimous protest against Imperial interference in Germany's foreign policy. The leading speakers of the chief parties in the Reichstag united in condemning his course. Though it was formerly the rule not even to mention the monarch's name in a debate, this rule had lately been more or less disregarded, and now the Reichstag went to the length of openly rebuking him. Herr Bassermann read a declaration by the central committee of the National Liberal party, which declared that the present interference of the Kaiser in matters of foreign policy was neither for the good of the Empire nor in accord with the constitution. He said he hoped that this was the last time they would have to approach the Kaiser on this subject.

The Radical leader made an even stronger speech along similar lines, and others, of much the same tenor, followed. Most of the speakers denied the statement in the interview that the majority of Germans were hostile to Great Britain. Prince von Bülow, in reply, said that the interview was evidently made up by linking together the remarks made by the Kaiser to certain English private persons, and that their details presumably were not all correct. What was said about the military plan of campaign for the Boer War was, he knew, incorrect. There was no detailed plan of campaign. It was merely a matter of academic opinions. As far as the attitude of Germany toward Great Britain at the time of the Boer War was concerned, he said that the German government had warned the Transvaal that, in the event of a war with England, it would stand alone. Moreover, Germany's attitude toward intervention had for a long time been well known. Certain other passages in the article were, he said, too strong, the colors having been laid on too heavily. The publication having failed to produce the intended effect in Great Britain, and having caused great regret to the Germans, he believed "the Kaiser would in future observe, even in private conversation, that measure of self-restraint

which is indispensable alike for a uniform policy and for the authority of the crown." The Chancellor, however, declared that he did not wish to make a scapegoat of any of his subordinates and that he accepted entire responsibility. He promised that such a mistake, which had arisen from a defect in the administration of his office, would not occur again. The debate continued on the following day, and other speeches condemning the interview were made. On Nov. 17, the Chancellor met the Kaiser at Potsdam and presented to him the state of opinion as to his action. According to the official report the Kaiser received this explanation seriously, and replied that, in spite of the exaggerated character of the criticism, he regarded it as his highest duty to safeguard the stability of the policy of the Empire, and that he approved the statements of the Chancellor in the Reichstag. The Kaiser's subsequent conduct showed that he took the censure of his people much to heart. For some time he abstained almost entirely from those public functions in which he was accustomed to participate with such frequency and zeal, and lived for a while in comparative retirement.

THE QUESTION OF RESPONSIBLE GOVERNMENT. Discussion of the objectionable interview raised at once the question of ministerial responsibility. In article 17 of the Constitution, all Imperial decrees and orders except those relating to military affairs, must be countersigned by the Chancellor, who "undertakes responsibility," but this does not establish the principle of parliamentary control. There may be votes of censure and interpellation, but there is no power to remove the Ministry. Prince von Bülow's resignation was merely a personal matter between the Kaiser and himself. The Social Democrats, in their discussion of the interview, pointed to the fact that unless the Ministry could be made to resign there was no way of compelling the monarch to keep within the constitutional limitations. The incident was taken by the Social Democrats and Radicals as pointing a moral for ministerial responsibility. It was demanded that the Chancellor should be made responsible to the Reichstag and subject to impeachment for the acts of the Kaiser, and a number of motions for the reform of the Constitution in this direction were introduced. On Dec. 2, they came up for debate. These motions had been put by Poles, Socialists, the Centre, and the Radicals. There was great difference of opinion upon them, and a commission of twenty-eight members was finally appointed to consider them. No report had been rendered at the close of the year.

THE PRUSSIAN SUFFRAGE QUESTION. The reform of the antiquated Prussian electoral system was much discussed in the closing months of 1907. Very early in 1908 the question reached an acute stage. On Jan. 10, the date fixed for the discussion of the subject in the Landtag, the motion for suffrage reform was introduced. It required universal, direct and equal suffrage with secret ballot in elections to the Lower Chamber. According to the existing system the voting power is based on the amount of taxes paid, the electors being divided into three classes: First, those who pay the highest taxes; second, those who pay the moderate taxes; and third, the great mass of the small taxpayers; each class paying one-third of the whole amount of taxes. These constitute the indirect electors who choose the direct electors,

one-third being chosen by each class. The direct electors in turn choose the representatives to the lower house of the Landtag. In the first class is included only a small fraction of the electoral body, from 3 to 5 per cent.; in the second class 10 to 12 per cent., and in the third class about 85 per cent. Thus the electors chosen by less than 25 per cent. of the population outnumber those selected by the rest of the nation by 2 to 1. Moreover, there has been no distribution of seats for over forty years, with the result that great disparity in the ratio of representation has come about. For example, in East Prussia there is one deputy for 63,000 inhabitants, while in Berlin there is one for 170,000. The Radical programme included therefore a redistribution of seats on the basis of the last census. There were many demonstrations in favor of the measure, and numerous petitions were received by the Landtag. On Jan. 10, the approaches to the building were thronged, and there was great popular excitement. Chancellor von Bülow flatly opposed the motion, declaring that he could not accept any modification of the present electoral system, because it would not accord "with the interest of the state." He said: "Every sound reform of the franchise will have to secure and maintain the influence of the great mass of the middle class upon the result of the election, and consequently will have to aim at reestablishing an equitable gradation in the weight of the different classes of votes." There was great disappointment among the people at this outcome, and on Jan. 12 there were some demonstrations in the streets of Berlin, organized by the Social Democrats. Crowds gathered in several parts of the city and there were conflicts with the police, in the course of which some shots were fired and several persons wounded, both in the crowd and among the police. Many arrests followed. There were outbreaks of a less serious nature in other cities. The attitude of the Liberal party toward this defeat occasioned much comment. The support of the Liberals in the Reichstag was necessary for the existence of the *bloc*, on which the Chancellor and the government depended for the passage of their measures. The Liberals had frequently asserted that the reform of the Prussian electoral system was vital to the Empire, and had implied that they would regard the Chancellor's attitude toward this question as a measure of his sincerity in making advances toward the Liberal party. In fact, they had positively declared that they would withdraw from the *bloc* if no concessions were made in this matter. Nevertheless, they accepted the Chancellor's curt refusal and took no measures to carry out their threat. The Socialists being shut out of Parliament began a campaign of popular agitation, whose first fruits were the riots above mentioned. The Liberal voters in their associations condemned the action of their representatives as cowardly, and demanded that they make good their promise to withdraw from the *bloc*. The Liberal deputies went so far as to establish a central Parliamentary commission to work for electoral reform and collect votes for that purpose, but for several months nothing definite was accomplished.

In April Chancellor von Bülow explained his opposition to the question of the Prussian franchise as follows: It was, he said, a matter of doubt in many minds whether the

universal franchise which existed for the Reichstag had all the advantages that were attributed to it. So far as the example of Great Britain was concerned, he said that it was to be noted that there the franchise was not universal, equal and direct. Experience of the system in the case of the Reichstag proved that too little attention was paid to qualifications of intelligence and political experience. Again, in the Empire, taxes were levied on articles of consumption, whereas in the States direct taxation proportioned to the taxpayers' means was the rule. Moreover, in Prussia municipal and communal governments had been successfully administered, and the Liberal element in them predominated; yet they were under the three-class system. Finally, the change would substitute for any existing evils the great evil of a predominant social democracy.

POLISH EXPROPRIATION. On Feb. 27, the Prussian Upper Chamber, after the pressing intervention of the Chancellor, passed the Polish Expropriation Bill. This measure, which was the subject of heated discussion not only in Germany, but all over the world, comprised the following essential points: It gave the state the right to acquire if necessary by expropriation land amounting to not more than 173,000 acres, in order to strengthen and round out the German settlements in West Prussia and Posen, by means of additional allotments of land to German colonists. Consecrated land in burial places, land belonging to churches and religious societies and recognized charitable institutions, if acquired before Feb. 26, 1908, were exempt. Friends of the measure contended that this was the only way in which the safety of the German element could be insured. The members of the *bloc* were divided on the question. The Radicals and the Centre in the Lower House and the titled landowners in the Upper House were against it. Most of the university professors and the mayors of the Liberal municipalities were for it. It was intended to prevent the German element from leaving the West Prussian Polish provinces and it was declared to be necessary on account of the high price to which land had been forced up in those provinces. The government said that it had asked for this authority as a recourse in case of necessity, but hoped that it would only rarely be enforced. The bill gave the government authority to borrow \$65,000,000 for this purpose and for carrying out its policy of settlement. In the foreign press the bill was severely criticized. The Polish novelist Sienkiewicz was especially active in arousing foreign opinion against it. He called it an unprecedented act and an insult to civilization and justice, and declared that the European press had branded it as infamous. A circular letter drafted by him was sent to all parts of the world by the Polish Press Information Bureau of Paris. It called forth many indignant protests from prominent men against the policy of the Prussian government. Thus the well known publicist, Anatole Leroy-Beaulieu, called the law a measure of spoliation directed against Prussian subjects who had committed no other crime than to move in defense of their own national language, and whose rights Prussian kings had sworn to respect when they took possession of Posen. Chancellor von Bülow, on Feb. 26, during the debate that preceded its passage in the Upper House, de-

clared that foreign comments should remain a matter of indifference to the Germans.

PRUSSIAN ELECTIONS. The elections to the Prussian Landtag, held on June 7, resulted in the return of seven Socialists, who thus for the first time gained admission to the Landtag. The campaign was not so much taken up with the question of electoral reform as had been expected, but the Socialists made a special feature of it. The new Landtag was constituted as follows, figures of the former session being given in parentheses; Conservatives, 152 (144); Free Conservatives, 60 (64); National Liberals, 64 (76); Radical People's Party, 28 (24); Radical Union, 8 (9); Centre, 105 (96); Poles, 15 (15); Social Democrats, 7 (0); Danes, 2 (2); Independents, 2 (5): Total, 443. The Liberals did not make a strong fight for universal suffrage during the campaign, for that would have involved an alliance with Socialism for which they were not prepared. They joined in a number of districts with the Conservatives, especially where it was a question of fighting against the Socialists. The Conservatives welcomed this alliance, but opposed the Liberals wherever there was no danger from the Socialist vote, especially in the eastern part of the Kingdom. As a result the Conservatives gained eight seats, the Centre gained nine seats over the National Liberals, owing to the alliance between the Centre and Socialists in the West; the Liberals suffered a marked decline. The greatest change was the appearance of the Socialists for the first time in the Landtag. Not only did they get seven seats in the Landtag (6 from Berlin and 1 from Hanover-Linden) but in a good many districts they decided the fate of the elections. This was due in some measure to the support of the disaffected Liberals and also to the effect of the new application of the income tax law, which changed the relations between the voting classes and resulted in a new distribution of districts in some of the large cities, and in Berlin the addition of new districts, largely Socialists. Although seven was a very small portion of the total number of members, the Social Democratic deputies were expected to wield considerable influence, owing to the large number behind them in the country. The Landtag held a brief session at the end of June, merely as a matter of form to prevent the necessity of assembling in the summer time, and the regular session opened in October. Some surprise was caused in the October meeting by the announcement in a speech from the throne that electoral reform was indispensable and would be undertaken during the coming session. It was not expected that the concessions would be of a nature to suit the reformers, but the announcement occasioned alarm among the Conservatives, whose press declared that they would defend the monarchy against the monarch.

THE SCHÜCKING AFFAIR. The Conservative gains in the Prussian Landtag elections placed the Liberal elements on their guard against reactionary tendencies. They found such a tendency in the course taken by the government in the affair of Dr. Lothar Schücking, Mayor of Hasum in Schleswig-Holstein, who had published the year before an anonymous work on the reactionary movement in Prussia, in which he attacked certain abuses incident to the power exercised in the state by the military and noble caste, the bureaucrats, and the rich student bod-

ies. The attack was mainly directed against administrative abuses. He had afterwards published in the Berlin *Tageblatt* and the *Hilfe*, under his own name, articles in which he again attacked the abuses mentioned in his book, thereby revealing himself as the author. The government then began proceedings against him, founding them on the charge that by publishing this book he had shown himself unworthy of the confidence and consideration that a mayor should enjoy. As there was nothing else against him, either as a mayor or as a private person, this action raised the question whether a simple declaration of opinion, disagreeable to the government, could afford a basis for disciplinary proceedings, and it was argued by the Liberals that if the principle on which the action was based held true in this case, there was nothing to prevent similar proceedings against any mayor whose ideas were displeasing to the government. Moreover, most of the mayors were of Liberal tendencies, and Dr. Schücking himself had been offered as a Liberal candidate. Hence, the Liberals declared that the government was attacking the party upon whose support of the *bloc* their own policy depended. The semi-official declaration that the proceedings were the work of subordinates, and that their superiors could not interfere, was not taken seriously by the critics. The government was attacked by the National Liberal and Independent press, and even by some Conservatives, and the Liberals again made their threat of withdrawing from the *bloc*.

THE HARDEN TRIAL. In 1907 the attacks by Maximilian Harden, editor of the *Zukunft*, on the personal character of Prince Eulenburg and Count Kuno von Moltke led to the bringing of a libel suit against Harden by Count von Moltke. Harden's charges had occasioned great scandal, having alleged gross misconduct on the part of members of the Court circle, and disclosed what was sensationally termed a "morass of infamy" in the army. The prosecution ended on Jan. 4, 1908, with a verdict of guilty against Harden, who was sentenced to four months' imprisonment and payment of costs. An appeal was taken to the Imperial Court at Leipzig. Gen. Hohenau and Count Lynar were court-martialed in January for complicity in the Harden affair; the former was acquitted, but the latter was sentenced to fifteen months' imprisonment. Partial vindication for Harden came in May, when Prince Eulenburg was arrested on charges of immoral conduct, after a long investigation by the authorities. Bail was refused. Owing to the illness of Prince Eulenburg the case had not come to trial by the end of the year.

OTHER EVENTS OF THE YEAR. During the year the question of unemployment was very pressing. In January meetings of the unemployed were held and resolutions were passed calling on the state to carry out its building and other projects, to remit the customs and excise duties on the necessities of life, and to remove all restrictions on the freedom of association. There was a debate on the subject in the Reichstag on Nov. 13, in the course of which a Socialist Deputy said that the sick fund indicated that at least 400,000, that is to say, about 3 per cent. of the working class, were out of employment. The Secretary of the Interior declared that the crisis was international and that other countries were even worse off. The iron, steel and textile industries suffered

the most heavily. During a debate in the Reichstag on Mar. 19th, a remark of one of the speakers having occasioned some laughter, another deputy, attributing the disorder to the newspaper men present, referred to the members of the press in insulting terms. Whereupon the newspapers, with the exception of some Catholic Centre organs, refused to report the Reichstag proceedings until an apology was made. The apology was made on Mar. 24 by the offending deputy, and the press resumed its reports. In August it was announced that the question of admitting women to the universities was settled in their favor. It was provided that women who are subjects of the empire may be admitted on the same footing as men, but if they come from other countries, special permission from the Minister of Public Instruction must be obtained. On Aug. 19, new regulations for the higher education of girls in Prussia were issued, placing the higher girls' schools on the same footing as the corresponding class of boys' schools. In March the Chancellor defined the government's policy in regard to Alsace-Lorraine as designed to develop the political status of the provinces, so that it might approximate the constitution of a Federal state. He said that he had approached the various Federal governments for that purpose, and hoped for a solution satisfactory to the population of Alsace-Lorraine. The international conference for the revision of the Berne copyright convention met in Berlin on Oct. 14.

GEVAERT, FRANÇOIS AUGUSTE. A Belgian composer and writer on musical subjects, died on Dec. 28, 1908. He was born in eastern Belgium on July 31, 1828, studied at the Conservatory of Ghent, and, winning the Prix de Rome, went to Italy. Returning to Ghent in 1843, he became organist of a church there and remained for six years. During this period he produced successfully two operas. In 1849 he went to Paris, later travelled through Italy and Germany, and returned to Ghent in 1852. He composed nine operas between the years 1852 and 1861. From 1867 to 1870 he was chorus master at the Opéra in Paris. He became director of the Brussels Conservatory in 1871 and continued to hold that position until his death. His compositions are no longer considered of importance, but his treatise on orchestration and his writings on church music are still consulted as authoritative.

GIBBS, OLIVER WOLCOTT. An American scientist, one of the first Americans to win international fame as a chemist. He died at his home in Newport on Dec. 9th, in his eighty-seventh year, after a career that gave him a reputation as one of the ablest chemists that this country has produced. The esteem in which he was held is to some extent indicated by the fact that he was one of the only two Americans ever elected to honorary membership in the American Chemical Society. He was also an honorary member of the Prussian Royal Academy of Sciences, as well as of the German and London chemical societies. He was one of the founders and a past president of the American National Academy of Sciences. During the Civil War he was active as a member of the U. S. Sanitary Commission, and was one of the founders of the Union League Club of New York. After graduating from Columbia in 1841, Gibbs studied at Berlin under Rammelsberg and Rose, at Giessen under Liebig, and at the Col-

lege of France, Paris. From 1849 to 1863 he was Professor of Physics and Chemistry in the College of the City of New York, then known as the Free Academy. In 1863 he was called to Harvard as Rumford Professor. During the twenty-five years of his active service at Harvard, Wolcott Gibbs was easily the foremost American chemist. His most important contributions to chemistry were the result of valuable work upon the cobalt mines, the platinum metals, and the highly complex double compounds of vanadium, tungsten, and molybdenum. These were all problems of the greatest difficulty, requiring the work of a master for their solution—so difficult, indeed, that some of Gibbs's work for over twenty years remained the only work done in those lines. He also published a very large number of papers dealing with analytical chemistry. Many of Gibbs's methods are still among the best that we have, and the analytical chemist of to-day is continually surprised by the great number and variety of Gibbs's contributions to this field. He was the first to use electrolysis as a means of metal determination, and his electrolytic determination of copper has become one of the classics of electro-chemistry.

In 1887 Gibbs retired from active work at Harvard and became professor emeritus. He did not retire from chemistry, however, but continued to work in a well equipped private laboratory in Newport, R. I., where he made his home for the remainder of his life.

GIBRALTAR. A British naval fortress on the south coast of Spain. Area, $1\frac{1}{8}$ square miles; population (1906), 18,624, exclusive of the garrison. The latter numbered 3874 in 1908-9. The port is free. The revenue and expenditure in 1907 were \$83,804 and \$71,760 respectively. The Governor and Commander-in-Chief in 1908 was General Sir F. W. E. F. Forestier-Walker.

GIFTS AND BEQUESTS. The sum of the gifts and bequests made in 1908 was considerably less than in 1907. In the latter year the amount thus given was considerably over \$150,000,000, while according to the record compiled by the *Chicago Tribune*, from which the list given below is taken, the amount donated in 1908 was \$90,032,090. Of these the donations were \$43,559,648, and the bequests, \$47,372,442. The total amount was distributed as follows: To educational institutions, \$36,552,039; to charities, \$39,729,961; to religious organizations, \$4,413,959; to museums, galleries, and public improvements, \$9,401,631, and to libraries, \$834,500. The most liberal giver in 1908 was Mr. Andrew Carnegie, whose benefactions totalled \$7,457,600. The gifts of Mr. John D. Rockefeller, second in magnitude, amounted to \$2,934,000. Among the notable benefactions were those of Lydia M. Bradley of Peoria, Ill., who willed to the Bradley Polytechnic School \$3,000,000; D. W. James of New York, who bequeathed to charity, \$1,405,000; Mrs. Quincy Adams Shaw, of Boston, who gave for settlement work, \$2,000,000; William W. Smith of New York, who gave \$3,000,000 to charity; Benjamin Rose, Cleveland, Ohio, \$5,000,000 for the same purpose; Frederick C. Hewitt, of New York, who gave to the Metropolitan Museum, \$1,500,000; Henry J. Braker of New York, who bequeathed to Tufts College, \$1,000,000, and George F. Parkman, of Boston, who left to that city for the development of the park system, \$5,500,000.

In the following list, both the names of the donors and the names of the institutions benefited are arranged in alphabetical order. Gifts or less than \$5000 are omitted on account of limitations of space.

Abbot, Mary E., Philadelphia, Pa., gift to charity, \$8000.

Academy of Fine Arts, gift by Lambert, James, Phila., Pa., \$50,000.

Adam, Ivers W., Boston, Mass., gift to Massachusetts Fish and Game Protective Society, \$5000.

Allen, William, Denton, Texas, gift to Southwestern University, \$100,000.

American Bible Society, gift by Bloodgood Cutter, \$665,000; Mrs. Russell Sage, \$200,000.

American College for Girls at Constantinople, gift by Helen M. Gould, New York, \$10,000; Mrs. Russell Sage, New York, \$10,000; Miss Grace Dodge, New York, \$10,000; John H. Converse, New York, \$10,000; unnamed donor, \$50,000.

American Girls School in Palestine, gift by Helen M. Gould, \$6,000.

American Girls School in Egypt, gift by Helen M. Gould, \$15,000.

American Museum of Natural History, gift by Morris K. Jesup, \$1,000,000.

Anderson, Lars, Brookline, Mass., gift to Harvard University, \$25,000.

Anglo-American Hospital, Rome, gift by Mrs. John A. Moore, \$5,000.

Armour, J. V., Chicago, Ill., gift to education, \$10,000.

Armstrong, Thomas M., Pittsburg, Pa., gift to charity, \$10,000.

Army Gymnasium, gift for, by Mrs. Russell Sage, \$25,000.

Astor, Mrs. William, New York, gift to charity, \$5,000.

Athenæum, Hartford, Conn., gift by J. Pierpont Morgan, \$40,000.

Ayer, F. F., New York, gift to charity, \$25,000.

Babb, Mrs. L. L., Minneapolis, Minn., gift to charity, \$30,000.

Bailey, E. W. & Taft, L. D., Chicago, Ill., gift to charity, \$10,000.

Baker, Louisa L., Amherst, Mass., gift to Massachusetts Agricultural College, \$6,000.

Baker, Thurston B., Norwich, Conn., gift to church, \$30,000.

Balmforth, Elizabeth, Saratoga, N. Y., gift to charity, \$750,000.

Banks, A. B., Fordyce, Ark., gift to Clary Training School, \$25,000.

Barbour, William, Paterson, N. J., gift to charity, \$20,000.

Barnard, Caroline, M., Everett, Mass., gift to charity, \$50,000; gift to Harvard University, \$6,000; gift to Tufts College, \$6,000.

Barr, William, West Orange, N. J., gift to charity, \$55,000; gift to Washington University, \$100,000.

Barrett, Curtis, Stafford, Vt., gift to Norwich University, \$100,000; gift to town, \$25,000; gift to church, \$10,000.

Barton, Mrs. Robert, Paterson, N. J., gift to charity, \$5,000.

Barton, Joseph L., Marshall, N. Y., gift to charity, \$260,000.

Basin, Wyo., gift of library by Andrew Carnegie, \$15,000.

- Batcheller, George S., Saratoga, N. Y., gift for library, \$100,000.
- Bates College, gift by Andrew Carnegie, \$50,000.
- Battles, Joseph A., Fitchburg, Mass., gift to charity, \$50,000.
- Beals, Charles L., Winchendon, Mass., gift to library, \$24,000.
- Beebe, E. E., Meredith, N. H., gift to church, \$30,000; gift to library, \$10,000.
- Beloit College, gift by Charles G. Stark, Milwaukee, Wis., \$10,000.
- Beloit College, gift by D. K. Pearsons, Chicago, Ill., \$25,000.
- Bennett, Mary J., Buffalo, N. Y., gift to charity, \$100,000.
- Berea College, gift by Andrew Carnegie, \$200,000; by unnamed donor, \$50,000; by various donors, \$80,000; by John T. Newton, Toledo, O., \$20,000.
- Berea College, Branch of, gift by Mrs. Russell Sage, New York, \$25,000.
- Betcher, Margaret, Red Wing, Mich., gift to charity, \$20,000.
- Bill, M. D., Springfield, Mass., gift for playground, \$40,000.
- Bixby, William G., Chicago, Ill., gift of library to Vergennes, Vt., \$200,000.
- Blackstone, Mrs. T. B., Chicago, Ill., gift to Y. M. C. A., \$25,000; gift to church, \$10,000.
- Blake, W. D., Melrose, Mass., gift to charity, \$10,000.
- Blount, Archibald H., London, Eng., gift to Yale University, \$450,000.
- Bogardus, Mr. & Mrs. C., Pellston, Mich., gift to University of Michigan, \$55,000.
- Bonney, Jesse L., Norfolk, Va., gift for Home for Girls, \$280,000.
- Bookwalter, John W., Springfield, O., gift to charity, \$5,000; to Wittenberg College, \$30,000.
- Boston, Mass., gift for park improvements by Geo. F. Parkman, Boston, Mass., \$5,500,000.
- Boston Athenæum, gift by Geo. F. Parkman, Boston, Mass., \$50,000.
- Boston College, gift by various donors, \$40,000; by W. F. Fitzgerald, Brookline, Mass., \$10,000; by various donors, \$130,800.
- Bowdoin College, gift by Ellen M. Chandler, Brunswick, Me., \$5000; gift by various donors, \$200,000; gift by various donors, \$253,000; gift by Andrew Carnegie, \$50,000.
- Bradley, Lydia M., Peoria, Ill., gift to Bradley Polytechnic School, \$3,000,000.
- Bradley Polytechnic School, gift by Lydia M. Bradley, \$3,000,000.
- Braker, Henry J., New York, gift to Tufts College, \$2,500,000.
- Bray, Mellen, Newton, Mass., gift to charity, \$1,000,000.
- Brearly, Annie B. S., Philadelphia, Pa., gift to charity, \$10,000.
- Bridgton Academy, gift by various donors, \$20,000.
- Briggs, George B., Newton, Mass., gift to Yale University, \$75,000.
- Brockfield, Helen, Sterling, Ill., gift to charity, \$60,000.
- Brown, Mary A. B., Baltimore, Md., gift to church, \$5,000.
- Browne, John B., Chicago, Ill., gift of business school, \$1,000,000.
- Browning, W. H., Galesburg, Ill., gift to Knox College, \$100,000.
- Bryn Mawr College, gift by various donors, \$34,500.
- Burbank, G. S., Fitchburg, Mass., gift to charity, \$440,000.
- Burke, Michael, Boston, Mass., gift to charity, \$5,000.
- Burt, Mary, Philadelphia, Pa., gift to charity, \$9,000.
- Busch, Adolphus, St. Louis, Mo., gift to Harvard University, \$50,000.
- Business School, gift of, by John B. Browne, Chicago, Ill., \$1,000,000.
- Butler, James, New York, gift to religious order, \$100,000.
- Byington, Alice, Stockbridge, Mass., gift to Hampton Institute, \$360,000; to Tuskegee Institute, \$50,000; to Mount Hermon School, \$25,000; to Northfield Seminary, \$25,000.
- Cagger, Peter, Albany, N. Y., gift to church, \$5,000.
- Callinan, W. F., Bryn Mawr, Pa., gift to charity, \$50,000.
- Card, Elizabeth A., Cleveland, O., gift to church, \$16,500.
- Carey, Arthur A., Boston, Mass., gift to Copley Society, \$20,000.
- Carnegie, Andrew, library to Enid, Okla., \$17,500; Bowdoin College, \$50,000; Bates College, \$50,000; Wittenberg College, \$5,500; Berea College, \$200,000; library to East Orange, N. J., \$19,000; Morgan College, \$50,000; additional gift to Newberry College, \$25,000; University of Denver, \$50,000; library to Bemidji, Minn., \$10,000; library to San Leandro, Cal., \$10,000; library to Youngstown, O., \$50,000; Beloit College, \$20,000; Stevens Institute, \$10,000; Illinois College, \$75,000; library to Collingwood, O., \$17,500; library to Howard University, \$50,000; additional gifts to library, Durango, Colo., \$2,500; gift to Carnegie Foundation, \$5,000,000; Wells College, \$40,000; Society of Mechanics and Tradesmen, New York, \$200,000; Carthage College, \$20,000; Stevens Institute, \$10,000; library to Houghton, Mich., \$15,000; additional gift to library at Hickman, Ky., \$2,000; library to Basin, Wyo., \$15,000; Christian College, \$30,000; library to Chelsea, Mass., \$50,000; for miners' relief, Wigan, England, \$7000; to Hero Fund for Great Britain, \$1,250,000; Republican Campaign Fund, \$25,000; Gustavus Adolphus College, \$42,500; church organ, \$10,000.
- Carr, Lucy E., Somerville, Mass., gift to charity, \$5,000.
- Carter, Mrs. Levi, Omaha, Neb., gift of park to city, \$50,000.
- Carthage College, gift to, by Andrew Carnegie, \$20,000; by various donors, \$100,000.
- Catholic High School for Girls, gift by Mrs. F. C. Penfield, Philadelphia, Pa., \$100,000.
- Catholic Missions, gift by various donors, Chicago, Ill., \$100,000.
- Cepilan, C. C., Libertyville, Ill., gift to education, \$60,000.
- Chandler, Ellen M., Brunswick, Me., gift to Bowdoin College, \$5,000.
- Chandler, R. D., San Francisco, Cal., gift to charity, \$8,000.
- Chelsea, Mass., gift of library by Andrew Carnegie, \$50,000.
- Christian College, gift by Andrew Carnegie, \$30,000.
- Clark, C. B., Neenah, Wis., gift for hospital, \$100,000.

Clark, William B., Stockbridge, Mass., gift to charity, \$20,000; gift to church, \$20,000; gift to library, \$20,000.

Clark College, gift by Joseph A. Battles, Fitchburg, Mass., \$5,000.

Clary Training School, gift to, by A. B. Banks, Fordyce, Ark., \$25,000.

Clougherty, S. J., Boston, Mass., gift to charity, \$5,000.

Cole, E. H., Brooklyn, New York, gift to St. Lawrence University, \$10,000; gift to Columbia University, \$100,000; gift to charity, \$19,000; gift to church, \$15,000.

College of Physicians, gift by Annie W. Penfield, Philadelphia, Pa., \$50,000.

Columbia University, gift to, by Henry F. and Ella D. P. Shoemaker, New York, \$10,000; gift by children of Orlando Harriman, \$100,000; gift by unnamed donor, \$22,600; gift by E. H. Cole, N. Y., \$100,000.

Conaty, Mary A., Derby, Mass., gift to charity, \$6,000.

Conley, Sarah, Pittsburg, Pa., gift to charity, \$500,000.

Converse, John H., New York, gift to American College for Girls at Constantinople, \$10,000.

Converse, M. E., Winchendon, Mass., gift to Rindge, N. H., \$10,000; gift to Soldiers' Memorial Building, \$10,000.

Copley Society, gift to, by Arthur A. Carey, Boston, Mass., \$20,000.

Cotton, George A., Philadelphia, Pa., gift to charity, \$35,000; gift to Temple College, \$10,000.

Crane, Thomas, heirs of, gift and library to Quincy, Mass., \$10,000.

Crane, Zena, Dalton, Mass., gift to Peary Expedition, \$10,000.

Crawford, Alexander, Philadelphia, Pa., gift to charity, \$18,300.

Crozer Theological Seminary, gift to, by Samuel A. Crozer, Chester, Pa., \$10,000.

Crump, G. A., Philadelphia, Pa., gift to charity \$5,000.

Cudahy, Michael, Chicago, Ill., gift to church, \$5,000.

Cumming, Peter, New York, gift to charity, \$60,000.

Cunningham, Thomas, New York, gift to charity, \$63,000.

Currier, B. W., Lynn, Mass., gift to charity, \$20,000.

Curtis, T. W., New York, gift to school at Sheffield, Mass., \$5,000.

Cutter, Bloodgood, Hempstead, L. I., gift to American Bible Society, \$665,000.

Dartmouth College, gift by John Ordonaux, \$30,000.

Dauberspeck, Philip, Butler, Pa., gift to church, \$5,000.

Davenport, Cyrus B., New York, gift to church, \$11,000.

Deaconess' Hospital, Denver, Col., gift by various donors, \$50,000.

Deering, William, Evanston, Ill., gift to Maine General Hospital, \$25,000.

Deering, William, Chicago, Ill., gift to Y. M. C. A., \$10,000.

Denison University, gift by John T. Newton, Toledo, O., \$50,000.

De Vinney, Elizabeth L., Glendale, Mo., gift to charity, \$11,000; gift to Woman's College, Baltimore, \$10,000.

Dodge, Miss Grace, New York, gift to American College for Girls at Constantinople, \$10,000.

Donnelly, Patrick, Arlington, Mass., gift to charity, \$5,100.

Donovan, Catherine, New York, gift to church, \$20,000.

Douglas, W. L., Brockton, Mass., gift to charity, \$10,000.

Drake, George S., St. Louis, Mo., gift to charity, \$12,000; gift to church, \$7,500.

Drown, A. M., San Francisco, Cal., gift to church, \$50,000.

Dulany, W. H., Hannibal, Mo., gift to charity, \$10,000.

Earhart, W. J., Philadelphia, Pa., gift to charity, \$25,000.

Early, Sarah L., Philadelphia, Pa., gift to charity, \$10,000.

Eastman, Jane, Manchester, N. H., gift to charity, \$5,000.

East Orange, N. J., library by Andrew Carnegie, \$19,000.

Edson, Mary, Lowell, Mass., gift to charity, \$20,000.

Elmendorf, Joachim, New York, gift to church, \$5,000.

Elve, Cyrus D., Philadelphia, Pa., gift to Temple University, \$5,000.

Ely, Smith, New York, gift to Sunday School Union, \$50,000.

Emery, Mary W., Cincinnati, Ohio, gift to Ohio Mechanic Institute, \$500,000.

Emory College, gift to, by various donors, \$100,000.

Enid, Okla., gift of library by Andrew Carnegie, \$17,500.

Erhard, Margaret, New Windsor, Md., gift to church, \$7,000.

Evans, Nancy D., Butler, Pa., gift to church, \$75,000.

Evans, W. T., Montclair, N. J., gift to charity, \$50,000.

Evenson, Ouden, W. Salem, Wis., gift to Norwegian Lutheran College, \$40,000.

Farwell, John V., Chicago, Ill., gift to Moody School, \$52,000.

Farwell, J. V. and Son, Chicago, gift to Y. M. C. A., \$25,000.

Fassett, Theodore S., Buffalo, N. Y., gift to Y. M. C. A., \$10,000.

Fearing, Henrietta S., Newport, R. I., gift to charity, \$10,000; gift to library, \$5,000; gift to schools, \$7,500.

Fernie Relief Fund, gift by James J. Hill, New York, \$5,000.

Ferris, Mrs. C. G., Detroit, Mich., gift to Missionary Training School, \$20,000.

Field, Mrs. Marshall, Chicago, Ill., gift to Theodore Thomas Orchestra Ass'n., \$5,000.

Filbert, Annie C., Philadelphia, Pa., gift to church, \$130,000.

Finch, John, Oakland, Cal., gift to Gettysburg College, \$100,000.

Fire sufferers, gift to, by James J. Hill, St. Paul, Minn., \$5,000; by various donors, \$30,000.

Fisk University, gift by John T. Newton, Toledo, O., \$5,000.

Fiske, David E., Chicago, Ill., gift to charity, \$122,500.

Fitzgerald, W. F., Brookline, Mass., gift to Boston College, \$10,000.

Flanagan, Mary., Philadelphia, Pa., gift to charity, \$10,000.

Folsom, Eliza F., Exeter, N. H., gift to charity, \$14,000.
 Ford, Mrs. E. L., Detroit, Mich., gift to school at Hazel Green, Ky., \$10,000.
 Fort Sam Houston, library to, gift by citizens of San Antonio, Tex., \$75,000.
 Fox, Virginia L. W., Washington, D. C., gift to church, \$17,000.
 Foye, P. T., Savannah, Ga., gift to charity, \$7,000.
 Francis, Daniel, Des Moines, Ia., gift to Preachers' Aid Society, \$40,000.
 Frank, Bertha R., Baltimore, gift to National Farm School, \$10,000.
 Franklin Institute, gift of Annie W. Penfield, Philadelphia, Pa., \$50,000.
 French, Mary D., Manchester, N. H., gift to church, \$5,500.
 Gage, N. L., Topeka, Kansas, gift to charity, \$20,000.
 Garmoe, Isaac, Fort Dodge, Ia., gift to Morningside College, \$25,000; gift to church, \$25,000.
 George Washington University, gift to, by John H. Hammond, New York, \$10,000; gift by John Ordonaux, N. Y., \$5,000.
 Gettysburg College, gift to, by John E. Finch, Oakland, Cal., \$100,000.
 Girls' Catholic High School, Philadelphia, gift by unnamed donor, \$100,000.
 Goeckus, Barbara H., Baltimore, Md., gift to charity, \$10,000.
 Gould, Elizabeth, Fairview, Conn., gift to charity, \$115,000.
 Gould, Helen, N. Y., gift to American College for Girls at Constantinople, \$10,000; gift to American Girls School in Palestine, \$6,000.
 Griffin, Walter T., Brooklyn, N. Y., gift to charity, \$250,000.
 Gustavus Adolphus College, gift to, by Andrew Carnegie, \$42,500.
 Hagan, Arthur, Philadelphia, gift to charity, \$5,750.
 Hager, Lisette, Buffalo, N. Y., gift to charity, \$62,000; gift to church, \$13,000.
 Hamilton, Irenus K., Chicago, gift to charity, \$10,000.
 Hamilton, Samuel, Pittsburg, Pa., gift to charity, \$11,000.
 Hammond, John H., New York, gift to George Washington University, \$10,000.
 Hampton Institute, gift by Alice Byington, Stockbridge, Mass., \$360,000.
 Haner, Barbara, Lancaster, Pa., gift to charity, \$5,000.
 Hardy, F. A., Chicago, Ill., gift to charity, \$15,000.
 Harper Memorial Fund, Chicago, Ill., gift by various donors, \$5,000.
 Harriman, Orlando, children of, gift to Columbia University, \$100,000.
 Harris, Norman, W., Chicago, gift for educational purposes, \$40,000.
 Hart, James A., Wilmington, Del., gift to charity, \$9,000.
 Harvard Music Association, gift by Julia M. Marsh, Boston, Mass., \$50,000.
 Harvard University, gifts by Grace M. Kuhn, Boston, Mass., \$350,000; by Lars Anderson, Brookline, Mass., \$25,000; by George F. Parkman, Boston, Mass., \$50,000; by Adolphus Busch, St. Louis, Mo., \$50,000; by Caroline M. Barnard, Everett, Mass., \$6,000; by Amy Sheldon, Newport, R. I., \$300,000; class donation, \$106,000.

Harvard University Dental School, gift to, by various donors, \$24,000.
 Hatch, L. F., Vineland, N. J., gift to charity, \$40,000.
 Hazel Green, Ky., gift to school by Mrs. E. L. Ford, \$10,000.
 Head, Betsy, New York, gift to city, \$187,746.
 Hebrew Institute, gifts by various donors, \$15,000.
 Hero Fund for Great Britain, gift by Andrew Carnegie, \$1,250,000.
 Hewitt, Frederick, New York, gift to charity, \$245,700; to Metropolitan Museum, \$1,500,000; to library, \$30,000; to Yale University, \$500,000.
 Hewitt, H. B., Albion, N. Y., gift to church, \$32,000.
 Hewitt, Harriet W., Albion, N. Y., gift to church, \$30,000.
 High School Athletic Field, Louisville, Ky., gift by unnamed donor, \$50,000.
 Hildreth, Amelia, New York, gift to church, \$20,000.
 Hill, James J., St. Paul, Minn., gift to fire sufferers, \$5,000; to Wesley College, \$25,000.
 Hill, James J., New York, to Fernie Relief Fund, \$5000.
 Hills, Alfred K., New York, gift of library to Hudson, N. H., \$20,000.
 Historical Society, gift by Annie W. Penfield, Phila., Pa., \$50,000.
 Holman, Mrs., and sister, New York, gift to charity, \$40,000.
 Home for Girls, gift by Jesse T. Bonney, Norfolk, Va., \$280,000.
 Houghteling, James L., Chicago, Ill., gift to Y. M. C. A., \$10,000.
 Houghton, Michigan, gift of library by Andrew Carnegie, \$15,000.
 Howard University, gift of library by Andrew Carnegie, \$50,000.
 Hubb, Mary L. D., Detroit, Mich., gift to Mount Holyoke College, \$10,000.
 Hudson, N. H., gift of library by Alfred K. Hills, New York, \$20,000.
 Hurlberg, Margaret E., Brooklyn, N. Y., gift to charity, \$5,000.
